Cuvier divided serpents into three sections, the first—of which the common blind-worm (q.v.) or slow-worm of Britain is an example—consisting of those which have the skull, teeth, and tongue similar to those of saurians, and in which the eye has three lids, and there are vestiges of bones of anterior limbs; the second, which Cuvier calls true serpents, having no vestiges of such bones, the eye destitute of lids, and the bones of the head so formed that the mouth and throat are capable of very great dilation; the third, which he calls naked serpents, containing only the genus *cacilia* (q.v.), now known, notwithstanding its form, to belong really to the batrachians or amphibia.

The serpents of Cuvier's first section have been conjoined with some of the nearly allied saurians, more or less furnished with external limbs, under the name *sauropsidia*, by Mr. Gray. They are connected with the true serpents by the families *amphisbænidæ* and *typhlopsidæ*, which nearly agree with them in the structure of the head and mouth, but want the third eyelid—some of the *typhlopsidæ*, indeed, having the eye itself merely rudimentary—and, like the true serpents, have no vestige of breast-bone or shoulder. These, with all the creatures included in this section, are, in so far as is known, perfectly harmless. They live chiefly on insects and other very small animals.

The true serpents live on larger prey, which they swallow entire, some of them—as the boas—crushing it by constriction in the coil of their muscular body. The prey of a serpent is often thicker than the serpent itself, and to admit of its being swallowed, the throat and body are very dilatable. The bones of the head are adapted to the necessity of a great expansion of the mouth and dilation of the throat. The bones composing the upper jaw are loosely joined together by ligaments; and even the arches of the palate are movable. The two halves of the lower jaw are connected by a ligament, so loose and elastic that they are capable of separation to a great extent; and the mastoid and tympanic bones, which connect the lower jaw and the skull, are lengthened out into pedicels, allowing an extraordinary power of dilation. Serpents, however, sometimes

seize prey too big for them to swallow, and die in the attempt, their teeth being so formed as to render it difficult to reject by the mouth what has once got into the throat.

The teeth of the true serpents are simple, and directed backward. In the non-venomous kinds there are four rows on the upper part of the mouth, two rows on the jaws, and two on the palate; each division of the lower jaw is also armed with a single row. In vipers, rattlesnakes, and other venomous serpents, there are no teeth on the upper jaw except the poison-fangs; the palatal teeth, however, forming two rows as in the non-venomous kinds, the arrangement of teeth in the lower jaw being also the same. Venomous serpents do not, in fact, need the same array of teeth as the non-venomous; depending rather on the power of their venom for their prey, which they suddenly wound, and then wait till it is dead. The poison-fangs are long in comparison with the other teeth; they are two in number, firmly fixed into a movable bone; when not in use they are laid flat on the roof of the mouth, covered by a kind of sheath formed by the mucous membrane of the palate; when the animal is irritated, and about to assail its enemy or its prey, they stand out like two lancets from the upper jaw. They move with the bone into which they are fixed; and the bone and muscles are so arranged that the opening of the mouth brings them into the position for use. There is above them, and toward the back of the head, a large gland for the elaboration of the poison, which is forced through them by the action of the muscles, each fang being tubular. The tube of the fang is formed, not as by a hollowing of it, but as by a bending of it upon itself, and is situated in front. The opening near the fang's point is a narrow longitudinal fissure. The poison-fangs are very liable to be destroyed, and the germs of new ones are generally found behind them, ready to grow and supply their place.

It is sometimes stated as a distinction between venomous and non-venomous serpents that the former have only two rows of teeth on the upper part of the mouth while the latter have four. This rule must not, however, be accepted without qualification. In the marine serpents (*hydriæ*), there are rows of maxillary teeth behind the poison-fangs; and some of the venomous land-serpents, as the bongars or rock snakes of the East Indies, which, however, are not among the most venomous, have some smaller teeth in the jaw-bones behind the poison-fangs.

The venom of serpents differs very much in its deadly power in different species. The bite of some causes the death of a human being in a few minutes, so that no creatures are more formidable; that of others proves fatal after the lapse of hours; while the bite of others, such as the common viper, is seldom fatal, although causing great pain and many unpleasant consequences. "I have carefully examined all the evidence on record," says Mr. Buckland, "as regards the most efficacious internal remedy that can be given in such cases, and have come to the conclusion that nothing is so good as ammonia" (*Curiosities of Natural History*). The same writer also recommends brandy or other stimulating drinks to be taken in large quantities. But it is of the utmost importance to suck the wound as soon as possible after it has been inflicted, and no danger is to be apprehended in doing so if there be no scratch or sore about the mouth, for the poison, so deadly when it mixes with the blood, is quite innocuous when taken into the stomach.

Many antidotes to the poison of serpents are in vogue in different countries, most of them, if not all, utterly unworthy of regard. Dr. Fayrer believes that the bite of the cobra, elaps, and Russell's viper is almost certain death. Tight ligatures above the bitten part to stop the circulation of the poisoned blood; excision; cauterizing with live coal, red-hot iron, or gunpowder; application of ammonia, and repeated doses of alcohol, are the chief remedies to be tried; but they must be resorted to *immediately* after the patient has been bitten.

The peculiarities of the lungs of serpents are noticed in the article REPTILES. The heart is placed very far back in the body. The intestines have a great absorbent power, and the faeces consist only of the most indigestible portions of the prey in an extremely desiccated state; the members of the animal which has been swallowed being still often distinguishable, and hair, scales, and the like remaining unchanged.

The tongue of serpents is forked and is often thrust out of the mouth. It is vulgarly regarded as the *sting*, but serpents have no sting, their only weapons being the fangs already noticed. The only sound which serpents emit is that of hissing.

Serpents are either strictly oviparous or they are ovoviviparous. The non-venomous serpents are generally oviparous; the venomous, ovoviviparous. The eggs of those which lay eggs are generally deposited in a long string, connected by a kind of viscous substance, in some heap of decaying vegetable matter, the mother paying no further heed to them. But some serpents coil themselves around their eggs and hatch them; and it would even seem that the habits of the same species differ as to this in different climates. The eggs of serpents are not quite devoid of calcareous covering, but have so little that their integument is soft and pliable.

It has been often alleged that vipers and other serpents when alarmed, swallow their young, and eject them again after reaching a place of safety. There still remains some doubt on this curious question, which has been much discussed; and it is not improbable that the alleged proofs of it from living young ones issuing out of the body of the parent when crushed, are to be accounted for by the ovoviviparous mode of generation.

It seems probable that serpents do not possess the senses of taste or smell in great

perfection. The ear has no external opening, and no tympanum, nor is it certain that their hearing is acute, but they are remarkably sensible of the power of music, of which serpent-charmers avail themselves, both to bring them from their holes and to control them. See SERPENT-CHARMING. A European gentleman, residing in one of the mountainous parts of India, found that his flute attracted them in such numbers to his house that he was under the necessity of ceasing to play it. Their eyes are small, and are protected from the dangers to which they might otherwise be exposed, by a transparent integument connected with the skin, and which comes away with the skin when the old skin is cast off, as is the case at least once a year.

Serpents are used as food by some savage tribes. They are capable of being tamed, and some of the non-venomous species have frequently been so, and have been found useful in killing mice, rats, and other such vermin.

SERPENT-WORSHIP, or **OPHIOLATRY**. From the earliest ages serpents seem to have exercised a mysterious fascination over the popular imagination. They are constantly making their appearance in the early mythologies. In Greece and Rome they form the hair of the Furies and the lashes of their whips; a serpent surrounds the Caduceus of Mercury, is the attribute of Esculapius and Hygeia, the god and goddess of health; and with its tail in its mouth is the symbol of eternity and an attribute of Saturn. Non-venomous serpents appear to have been the object of a special worship in ancient Egypt. In India in very remote ages the serpent was a symbol of eternity, of the sun, and of the Divine Spirit. The earth itself was called Sarparajni, the serpent-queen. Snakes came to typify the annual motion through the ecliptic. To this day, when the sun is under an eclipse, the common people believe that a great dragon is devouring him. In course of time the symbol of divinity became itself divine, and was invested with a priesthood and a cult. Traces of S. W. may be found in the Vedas, while the later Puranas claim for the incarnate Naga, or serpent, near kindred with Siva and Vishnu. S. W. still exists in many parts of India. In the districts of Kolapore and Sattara, Hindus of all classes still pay yearly tribute of prayers, flowers, and food, to Naga, their serpent idol, and grand processions commemorate the hallowed day. In some parts of the Deccan temples have been reared to Naga, and in one place live snakes are caught and worshipped. A class of Brahmins claim for themselves divine honors, as being the living temples of the divine Naga. See **OPHITES**.

SERPULA, a genus of annelida, of the order *tubicole*, forming and inhabiting a calcareous tube, like that of mollusks, and therefore described in old works on conchology. Indeed, the shell of a serpula is not always easily distinguished from that of mollusks of the genus *vermetus*, although the inhabitants are extremely different; but the shell of *vermetus* has a regular spire at the apex, which is not found in that of any serpula. The serpulæ attach their shells to rocks, shells, etc. in the sea. The shell is variously contorted, and some of the species live in groups, with the shells intertwined. The wider end of the shell is open, and from it the animal protrudes its head and gills, which expand as beautiful fan-like tufts. They are in general exquisitely colored, and serpulæ are among the most interesting and beautiful creatures that can be placed in an aquarium. On the slightest alarm, they disappear completely into the tube, which then is closed by an operculum curiously framed as an appendage to the gills. The largest species are found in tropical seas, and are among the many lovely objects to be seen in looking down through clear still water on coral reefs. See *illus.*, **WORMS**, ETC., vol. XV.; also *illus.*, **OOLITE GROUP**, vol. X.

SERRANO Y DOMINGUEZ, FRANCISCO, Duke de la Torre; b. Spain, 1810; served in the war of independence. He was a member of the junta which overthrew Espartero in 1843, and after the restoration of Maria Christina, helped Narvaez overthrow Olozaga. His influence over queen Isabella after her marriage, in 1846, was so great as to cause serious dissensions between her and the king consort. He overthrew the Sotomayor ministry, which attempted his downfall, but the Salamanca ministry, though supported by him, was overthrown by public disapproval. Serrano now became a liberal, was appointed capt.gen. of Granada, was exiled in 1854 for complicity in an insurrection at Saragossa, came back during the revolution in that year, and supported the O'Donnell-Espartero cabinet. In the dissensions between them he took part with O'Donnell, and as capt.gen. of New Castile acted with O'Donnell in the *coup d'état* of 1856. He was ambassador to Paris in 1857, and capt.gen. of Madrid in 1865. Three years later he was associated with Prim and Topete at the head of the revolution, Prim taking the ministry of war, Serrano becoming commander-in-chief of the army and president of the council, and Topete minister of marine. He was presently elected regent, and remained in that office till Amadeo accepted the throne. In 1874 he became president of the executive power in Spain. His appointment as ambassador in Paris was gazetted, 1883. D. 1885.

SERTO RIUS, Q., one of the ablest Roman commanders in the later ages of the republic, was a native of Nursia, in the country of the Sabines, and began his military career in Gaul. He fought, 105 B.C., in the disastrous battle on the Rhone in which the Roman proconsul, Q. Servilius Cæpio, was defeated by the Cimbri and Teutones, and took part in the splendid victory at Aquæ Sextiæ (mod. Aix), 102 B.C., where Marius annihilated the same barbarians. On the breaking out of the sanguinary struggle between the party of the nobles under Sulla (q.v.), and the popular party headed by Marius (q.v.) (88 B.C.),

he espoused the cause of the latter. Morally, he was much superior to the military adventurers of his time; and the impression we have of him from Plutarch's picturesque biography is that of a valiant, resolute, honest, and stubborn Roman, such as was commoner in the 3d than in the 5th c. of the republic. None of the Marian generals held out so long or so successfully as he against the victorious oligarchy. He fought in conjunction with Cinna the battle at the Colline gate, which placed Rome at the mercy of the Marians, but he had no hand in the bloody massacres that followed. What we do hear of him is to his credit. He got his own troops together, and slew 4,000 of the ruffianly slaves whom Marius was permitting to plunder and ravish at will through the city. On the return of Sulla from the east (83 B.C.), Sertorius withdrew into Etruria, but finding it impossible to act in concert with the other military leaders of his party, he went to Spain, where he continued the struggle in an independent fashion. At first he was not very successful, and found it advisable to embark for Mauritania. After several adventures, in the course of which he once passed through the strait of Gibraltar, and fell in with some sailors who had visited the Atlantic islands, and whose descriptions so wrought upon his imagination, that he "was seized with a strong desire to dwell in the islands, and to live in quiet, free from tyranny and never-ending wars"—(Plutarch)—he returned to the peninsula, at the invitation of the Lusitanians, got together an army composed of natives, Libyans, and Romans, and after a time became the virtual monarch of the whole country. During 80-76 B.C., he was victorious over all his opponents, nor was it until the arrival (76 B.C.), of young Pompey ("Pompey the Great"), that he found an opponent worthy to cope with him; and even Pompey was scarcely yet his equal in military skill. Sertorius drove Pompey over the Iberus (Elbro) with heavy loss; nor was the campaign of the following year (75 B.C.), more favorable, for though Sertorius's subordinates were twice beaten, Pompey himself had no success, and was forced to write urgent letters to the senate for re-enforcements. The campaigns of the next two years were unimportant, except in so far as they show us the gradual operation of that miserable jealousy and envy of Sertorius that brought about his ruin. Perperna, and other Roman officers of the Marian party, who had fled to him in 77 B.C., when Sulla became triumphant at home, and who seem to have been a set of base adventurers, secretly stirred up the Spaniards against him, and when that artifice did not prove so successful as was hoped, they conspired against his life, and assassinated him in his own tent, 72 B.C., under circumstances of shameful perfidy. With Sertorius the Marian or popular cause sunk, until it was revived and attained final success in the person of Julius Cæsar (q.v.). Plutarch has written Sertorius's life, and Corneille has made it the subject of a tragedy.

SERTULARIA, a genus of Campanularian hydroids, in which the branched horny investment of the plant-like colony forms a cup around each polyp. The polyps are arranged in double row, and the colony is attached to stones, shells, sea-weeds, etc. Numerous species of *S.* occur round the British coasts. See *ACALEPHÆ*; *HYDRA*; and *Hincks' British Hydroid Zoophytes*.

SERUM. See *BLOOD*.

SERVAL, *Felis serval* or *leopardus serval*, one of the smaller *felidæ*, a native of South Africa, the *boschkatte*, or bush-cat, of the Cape Colony. It is about 2 ft. in length, exclusive of the tail. The serval is a beautiful animal, yellowish with black spots, the lower parts white with black spots. The fur of the serval is in great request, and is known to furriers as that of the *tiger cat*. The serval is one of the mildest and most docile of the *felidæ*. See *illus.*, *CARNIVORA*, vol. III.

SERVANT. See *MASTER AND SERVANT*.

SERVETUS, MICHAEL, or, in his native Spanish, MIGUEL SERVEDE, a notable and unfortunate speculator in theology, was b. at Villanueva, in Aragon, in 1511. At the age of nineteen he quitted Spain, and commenced the study of law at Toulouse, which he soon abandoned to devote himself with ardor to the knotty points of the reformation doctrines. In 1530 he went to Basel to hear Ecolampadius, and thence to Strasburg, where Bucer and Capito taught. His daring denial of the doctrine of the Trinity frightened or angered these divines to such a degree that they denounced him as "a wicked and cursed Spaniard." Servetus appealed from their judgment to that of the public in his *De Trinitatis Erroribus Lib. VII.* (Haguenau, 1531; modern edition, Nuremberg, 1791), and his *Dialogues* (Haguenau, 1532); but the public thought as little of his teaching as the theologians; and to avoid the odium which it had occasioned, he changed his name to Michael de Villanueva, and fled to Paris; where he studied medicine under Sylvius and Fernel, and took his degree as a physician with honors. Servetus seems to have possessed a kind of penetrating, if also rash and restless intellect, which enabled him to hit truth occasionally in his flighty researches, or, at least, to make happy guesses in the right direction. Thus, for example, he had an idea (see M. Flourens in the *Journal des Savans*, April, 1854) of the doctrine of the circulation of the blood. He attacked Galen and the faculty with his customary violence in a treatise on syrups (*Syruporum Universa Ratio*, Paris, 1537; Lyons, 1546). About this time he made the acquaintance of Calvin, with whom he had several conferences or private disputations, the result of which was a public challenge; but Servetus, after assenting to the arrange-

ments, decamped, afraid probably, and not without reason, that his precipitate imperious way of thinking did not fit him for discussing with so cool, wary, and merciless a logician as the Genevese reformer; afraid, too, perhaps, of being unceremoniously handed over to the authorities for heresy! After living successively for some time at Lyons, Charlieu, and Avignon, and supporting himself by writing for the booksellers, he found an asylum in the palace of Pierre Paulmier, archbishop of Vienne, in 1541, where he remained for some years, and wrote his famous *Christianismi Restitutio*, first published in 1553. The work has been twice reprinted, first by Dr. Meade of London (incomplete), and again by Murr, at Nuremberg, in 1790. Its celebrity is due more to the fact that it sealed the fate of its author, than to its intrinsic merits, the ideas being obscure, and the style incorrect. After its publication, Servetus wished to go to Italy, by way of Switzerland, but in passing through Geneva, was arrested and imprisoned at the instigation of Calvin (q.v.). After a long and complicated judicial procedure, Servetus was condemned to be burned, and the sentence was carried into execution, Oct. 27, 1553. The fate of Servetus, after all the palliations that can be offered are weighed, remains a dark stain on the memory of Calvin. See Willis's *Servetus and Calvin* (1877).

SERVIA (Turk. *Syryp*), a kingdom formerly included within the limits of European Turkey, but independent since 1878. It is bounded on the n. by Austria; on the e. by Wallachia and Bulgaria; on the s. by Roumelia and Bosnia; and on the w. by Bosnia. Area, 19,050 sq. m.; pop. '95, 2,288,259. The country is mountainous and densely wooded. From the interior, numerous chains proceed northward, forming massive barriers both on the eastern and western frontiers, and sloping pretty steeply toward the swampy plains along the Save and the Danube. In the extreme n.e. near Orsova they reach the very edge of the Danube, and along with the Eastern Carpathians on the opposite shore, imprison the great river within a wall of rock, known as the *Iron Gate* of the Danube. The highest of these chains is the Rudnik mountains (gathered into a knotty group about the center of the state), which in the Great Schturaz attains an elevation of 3,400 feet. The *Schumadia*, or forest, extends southward from Belgrade for 60 miles. Beautiful landscapes are everywhere to be seen. The principal rivers (Serb. *Rjeka*) flowing through the country are the Morava and Timok, affluents of the Danube; and the Kolubara, an affluent of the Save, which itself falls into the Danube at Belgrade. The climate is salubrious, but somewhat cold in the higher regions.

Constitution, etc. — S. was proclaimed a kingdom in 1882. The legislative power is vested partly in the king, partly in the national assembly (Skupschtina). There are eight ministers who assist the king in the exercise of his executive functions. The council of state, or senate, is a deliberative, not legislative body, and has the duty of drafting the laws to be submitted to the Skupschtina. The members are nominated for life, and numbered 16 in 1897. The Skupschtina consisted in 1896 of 134 members, who are elected indirectly and by ballot of the people, the voters having a property qualification. This body meets each year, but there is also a Great National Assembly, which is called to decide important constitutional questions and has double the number of representatives in the ordinary assembly. The army, as reorganized by the act of 1886, comprises an active army, a reserve, and a national militia. On a war footing in 1896, the three branches together had an estimated strength of 337,323 men. The country being almost exclusively agricultural, its principal exports are agricultural produce and fruits, together with animals and animal produce, but it is said to have considerable mineral resources. In 1894 the railway mileage was only 336. Alexander I., the ruler of Servia, is the fifth of his dynasty and the son of King Milan I. He was born in 1876, and became king under a regency in 1889, but in the spring of 1893 assumed full royal authority.

Religion, Education, and Finance. — The established religion is the Greek Orthodox, to which almost all the inhabitants belong; but there are a few thousand Roman Catholics, Mohammedans, Protestants, and Jews. The church is under a synod of bishops, of which the metropolitan of Servia is president, but all ecclesiastics are under the direction of the ministry of education and public worship. Members of other religions than that of the state are allowed freedom of worship. Primary education is compulsory and the cost of it is met partly by the state and partly by the municipalities. There are several private schools, and some special secondary schools maintained by the government, such as a military academy, commercial school, agricultural school, etc. In spite of efforts to promote education, the number of illiterates is very great. In 1890 it was estimated that only 14% could read and write. As to the finances, the main sources of revenue are direct taxes and monopolies, but the railways, public domains, posts, telegraphs, and customs also yield a considerable income. In 1897 the estimated revenue and expenditure were each between 66,000,000 and 67,000,000 dinars, the value of the dinar (which is equivalent to the franc) being in United States currency about 19.3 cents. The Servian debt, on Jan. 1, 1896, was 413,607,500 dinars, bearing interest, for the most part, at 4%.

Character. — The Servians are distinguished for the vigor of their frame, their personal valor, love of freedom, and glowing poetical spirit. Their manners and mode of life are exceedingly picturesque, and strongly prepossess a stranger in their favor.

History. — In the earliest times of which we have record, Servia was inhabited by

Thracian or Illyrian races—the Bessi, Scordisci, Dardanii, and Triballi. Shortly before Christ it was subjugated by the Romans, and under the name of *Mesia Superior* formed part of the province of Illyricum, whose fortunes it shared during the vicissitudes of the empire. Overrun successively by the Huns, Ostrogoths, Longobards, etc., it reverted to the Byzantine rulers about the middle of the 6th c., but was wrested from them by the Avars in the 7th c., to oppose whom the emperor Heraclius, about 636, invoked the aid of the Serbs from eastern Galicia. The Serbs obeyed the call, and in less than two years drove the Avars from the land, over which they themselves spread in great numbers, their settlements extending from the Morava as far w. as the Dalmatian Alps and the Adriatic, and from the Save as far s. as the Balkan and lake Scutari. About the middle of the 9th c. they were converted to Christianity by missionaries sent by the emperor Basilus, but this did not in the least abate their natural ardor for battle, and for nearly 200 years they were almost constantly at war with the neighboring Bulgarians—the inveterate enemies of their Byzantine liege lord. In 1043, however, Stephen Bogislav expelled the imperial governors; and during 1050–80 his son, Michael, made himself wholly independent, took the title of king of Servia, and procured the recognition of his royal dignity from pope Gregory VII. For the next hundred years the Serbs had to fight hard to maintain their independence, but the struggle terminated in their favor; and in 1165 Stephen Nemanja founded a dynasty which lasted for two centuries, during which period the kingdom of Servia attained the acme of its power and prosperity. Under Stephen Dushan (1336–56), the greatest monarch of the Nemanja dynasty, it embraced the whole of Macedonia, Albania, Thessaly, northern Greece, and Bulgaria. The progress of the Turkish arms, however, was fatal to its welfare, and in 1389 king Lazar fell in the disastrous battle of Kossovopolje. Sultan Bajazet divided the country between Lazar's son, Stephen, and Lazar's son-in-law, Vuk Brankovitch, but compelled both to pay tribute, and to follow him in war. Gradually the Serbs sunk more and more under the Turkish yoke, until, in 1459, Servia was thoroughly subjugated by the sultan Mahmud. It was uniformly the theater of the bloody wars between Hungary and Turkey, and frequently suffered the uttermost horrors of devastation. Prince Eugene's brilliant successes for a moment flashed a ray of hope into the miserable hearts of the long-suffering Serbs, and by the treaty of Passarowitz (1718) a considerable portion of the country was made over to Austria; but in 1739 it reverted to Turkey, and for the next 60 years the cruelty and oppressions of the pashas and their janizaries surpasses all belief. At length the unhappy people could endure the tyranny of their foreign masters no longer, and in 1801 an insurrection broke out, headed by George Czerny (q.v.), which, by the help of Russia, ended in the triumph of the patriots, and in the election of Czerny by the people as prince of Servia. The invasion of Russia by France, however, left the Serbs at the mercy of their late rulers, and the war again broke out. Czerny was forced to flee, and the tyranny of the Turks became more ferocious than ever. Again the people flew to arms under the leadership of Milosch Obrenovitch, and were a second time successful in winning back their liberties. Milosch was chosen prince of Servia in 1815. Compelled to abdicate in 1839, he was, in 1858, restored to his former dignity, which was made hereditary in his family. In July, 1876, Servia, excited by the rebellion in Herzegovina, declared war against Turkey, and was joined by Montenegro. The Servians, generally unsuccessful, in spite of the help of numerous Russian volunteers, were totally defeated at Alexinatz in September; in November an armistice was concluded; and in Mar., 1877, the conditions of peace were signed. Next month war was declared by Russia against Turkey. The sympathies of the principality were undoubted; but Servia did not venture again to take the field against Turkey till the fate of the war had been practically decided by the fall of the Turkish stronghold of Plevna in Dec., 1877. The recognition of Servia's independence and an important increase of its territory to the southward, demanded by Russia at the close of the war, were agreed to by the Berlin congress in 1878.

In 1885 war was declared by Servia against Bulgaria, but the Servian army, though large and better equipped than that of the enemy, was defeated by the military genius of Prince Alexander of Bulgaria (q.v.); and on the intervention of the great powers, a treaty of peace was signed in the same year. On March 6, 1889, king Milan abdicated in favor of his son Alexander, a child of 13, after divorcing his wife Natalie. At the present time the government is carried on in the name of Alexander by two Regents, who in May, 1891, expelled the Queen Mother from the kingdom as being engaged in intrigues looking to the establishment of Russian influence.

Language and Literature.—The Servian language, called also the Illyrian, belongs to one of the four great divisions of the Slavic family, and is more nearly allied to Russian than to Polish or Bohemian. It is distinguished from the other members of its division by the predominance of vowels, and consequently by its soft, melodious resonance. This character it owes in part to the influence of the Italian and Greek languages—the former influence being the result of commercial intercourse; the latter of community of religious belief. The long domination of the Turks has also left unmistakable traces on the Servian tongue; nevertheless it has on the whole preserved a genuine Slavic character, possessing along with the other members of that family a complete system of declension and conjugation, along with a free syntax. The old classical meters are imitated with facility in it. It is spoken (in the three dialects—Herzegovic, Razavic,

and Syrmie) by more than 7,000,000 people, of whom 4,500,000 are under Austrian, 2,500,000 under Turkish, and a few under Russian authority.

After their conversion to Christianity, the Serbs, like the Russians, employed the old Slavic church language in writing, but in two different styles, one called the church style, and the other the chancery or legal style. The most important monument of the latter is the "law-book," published by king Stephen Dushan, though the oldest extant specimens go back as far as the 11th century. The literary remains of the former are more numerous, and embrace ecclesiastical, devotional, and historical works, for the most part composed by the clergy and the monks. With George Brankovitch (b. 1645, d. 1711), who wrote a *History of Servia* from the origin of the nation to his own time, this first or mediæval period in Servian literature closes. The second or modern period is characterized in its commencement by an effort to raise the spoken language of the Serbs to the dignity of a written language. The consequence was, for a considerable time, the literary language of Servia was a chaos of confusion, writers not appearing able to make up their minds which dialect to use, and spoiling their productions by a barbarous mixture of both; and it was not till Vuk Stephanovitch published his *Grammar of the Servian Language* (1814), and his *Songs of the Servian People*, that the victory of the reformers was complete. Since then the spoken language of Servia has also become the language of literature. These Servian popular songs or ballads constitute by far the finest part of Servian literature. The picturesque scenery of the land, and the free solitary life led in the mountain ranges, kindled the imagination of the people, and awoke the voice of song at an early period. Some of the ballads—now so widely known throughout Christendom by means of translation—go back to a period anterior to the appearance of the Turks in Europe. In a wonderful manner they combine the rude strength, spirit, and *naïveté* characteristic of the ballad everywhere, with oriental fire and Greek plasticity. They are invariably unrhymed, but preserve at the same time a rhythmic measure. See Kapper's *Volkslieder der Serbien* (2 vols. Leip. 1852); and Bowring's *Servian Popular Poetry* (Lond. 1827); and Owen Meredith's *Serbske Pesme* (Lond. 1861); the last, however, a book of doubtful honesty. Among the poets who acquired distinction in the first part of the century, and have employed the vernacular, the most important is Lučyan Muschiki (died 1837), archbishop of Carlovitz, whose *Poems* appeared at Pesth in 1838. Of recent or living Servian poets, the most gifted are Branko Raditshevitz and Jovan Ilitz. As yet, science has made little progress. In another branch of the Servian people—the so-called Illyrians, especially the Dalmatians, who profess the Roman Catholic faith—literature received an earlier and more artistic development than among the Serbs of the Greek church. In the 12th c. a priest of Ducla (Dioclea) wrote a chronicle, first in Slavic, and afterward in Latin, fragments of which are still extant. During the 13th and 14th centuries devotional works in the vernacular were numerous, toward the end of the 15th c. the republic of Ragusa (Slav. Dubrovnik) obtained the name of the "Illyrian Athens" on account of the brilliant success with which it cultivated literature, art, and science. Epic, lyric, and dramatic poetry, history, and jurisprudence are all admirably represented. The list of its poets is particularly large. Toward the end of the 18th c. literary activity abated among the southern or Illyrian Serbs, but at the same time began to increase in the n., especially in Croatia and Hungary.—See Ristitz, *Ueber die Serb. Literatur* (Berl. 1853), and, in English, Talvi's *Historical View of the Languages and Literature of the Slavic Nations* (New York, 1850); as also Schafarik's *Geschichte der Südslavischen Literatur* (1864), and Novakovitch's *Istoriya srpske Knjizevnosti* (Belgrade, 1867). There are numerous grammars and dictionaries.

SERVIAN POLITICAL PARTIES. See POLITICAL PARTIES, SERVIAN.

SERVICE, *Pyrus domestica* (see PYRUS), the *Sorbus domestica* of many botanists, a tree of 50 or 60 ft. in height, with pinnated leaves, which are downy beneath, and their leaflets serrated upward, and small white flowers in panicles, a rare native of England, found also in various parts of Europe, the w. of Asia, and the n. of Africa, and cultivated for its fruit, which is obovate, and about an inch in length, resembling a small pear, but pleasant only in a doughy and over-ripened state, like the medlar. It is more cultivated in Italy, Germany, and France than in Britain. The tree is of very slow growth, and attains a great age. The timber is valuable, very heavy, fine grained, and susceptible of a high polish, possessing a strength and durability which particularly adapt it for some purposes of the machine-maker. It is used also for making mathematical rulers, etc.

SERVICE AND WORK is the name usually given to an action brought by a workman who has done work to order, or on request, or has been engaged for a specific time.

SERVICE-BERRY. See JUNE-BERRY.

SERVICE OF HEIRS is a proceeding in the law of Scotland by which the heir of a deceased owner of land has his relationship recognized and declared, and his feudal title to the land completed.

SERVITUDE, a name borrowed by the law of Scotland from the Roman law, to denote that kind of right or interest which a person often has in land of which he is not the owner, as a right to cut turf, etc. Servitudes are divided into predial and personal. A predial servitude is a right constituted over one subject or tenement by the owner of another subject or tenement; while a personal servitude is constituted over a subject in favor of a person without reference to possession of property. The only kind of per-

sonal servitude is life-rent or usufruct. The predial servitudes are those usually referred to under the head of servitude. Such a servitude being constituted in respect of the ownership of property, passes to third parties with such ownership. The tenement over which the servitude exists is called the servient tenement, and the other is called the dominant tenement. Predial servitudes are again subdivided into rural and urban, according as they affect land or houses. The usual rural servitudes as those of passage or road, pasture, feal and divot, aqueduct, thirlage, etc. Passage or road is the right which a person has to walk or drive to his house over another's land. Pasture is the right to send cattle to graze on another's lands. Feal and divot is the right to cut turfs or peats on another's land. Aqueduct is the right to have a stream of water conveyed through another's lands. Thirlage is the right to have other people's corn sent to one's mill to be ground. The urban servitudes are stillicide, light, *oneris ferendi*, etc. Stillicide is the right to have the rain from one's roof drop on another's land or house. Light is the right to prevent another from building so as to obstruct the windows of one's house. *Oneris ferendi* is the right of the owner of the flat above to have his flat supported by the flat beneath.

SERVIUS TULLIUS. See **ROME**.

SERVUS SERVORUM DEI (Lat., Servant of the Servants of God), a form of subscription adopted by the Roman pontiffs from the days of Pope Gregory the Great, by whom, according to his biographer, Paul the Deacon, it was assumed as a practical rebuke of the ambitious assumption of the title of "Ecumenical (or universal) patriarch," by John, surnamed Nesteutes, or the faster, the contemporary patriarch of Constantinople. Gregory is said, indeed, by Paul to have been the first Christian bishop by whom this humble form was employed. This, however, is certainly a mistake, the same designation having been frequently used by bishops before the time of Gregory. Gregory was probably the first of the bishops of Rome to adopt it as a distinctive title. It is found in all the letters of Gregory which Venerable Bede has preserved in his history.

SESAME GRASS (*Tripsacum dactyloides*), a species of grass of large size found on the Atlantic coast of the United States and in the gulf states. The stem is thick, and the leaves broad, somewhat resembling the sugar cane. It is generally considered too coarse for fodder.

SESAMOID BONES are small bones met with in the substance of the tendons of muscles in the neighborhood of certain joints. They derive their name from the Gr. *sēsamē*, a kind of Indian grain, which they were supposed to resemble. In the human subject, the patella is the best example; and besides it they are commonly met with only on the palmar aspect of the joint which unites the metacarpal bone with the first phalanx, and in the corresponding position in the toe, there being two in each position, and their object being to increase the leverage of the short flexor muscles of the thumb and toe. They are much more abundant in the great majority of mammals than they are in man.

SESAMUM, a genus of plants of the natural order *bignoniaceæ*, suborder *pedaliaceæ*, a suborder characterized by wingless seeds, and placentæ with woody lobes attached to the inner wall of the fruit. The calyx of sesamum is five-parted; the corolla bell-shaped and five-parted, the lowest lobe prolonged; the stamens four, two longer than the others, and a rudimentary fifth stamen; the capsule is oblong, almost four-celled, two-valved, many-seeded. The species are natives of India and Africa, and are annual plants, covered with hairs, their flowers solitary in the axils of the leaves, on very short stalks. They are so similar as to be sometimes reckoned mere varieties of one species, *S. Indicum*. The sweet oleaginous seeds are used in some countries, as in Central Africa, for making a kind of hasty-pudding. In Egypt they are eaten strewed on cakes. The bland fixed oil of sesamum, obtained from the seeds by expression, is used as an article of food, and for medicinal purposes, like olive oil. It keeps long without becoming rancid. It is much used by the women of Egypt as a cosmetic. For the sake chiefly of its oil, sesamum is much cultivated in India, China, Japan, and in many tropical and sub-tropical countries, and has been cultivated from very ancient times. It is too tender for the climate of England. The oil-cake, mixed with honey and preserved citron, is an oriental luxury. The leaves of sesamum abound in a gummy substance, which they readily impart to water, making a rich bland mucilage, which is used in the southern parts of the United States as a demulcent drink. Sesamum is sometimes called *tilseed*.

SESBA'NIA. See **DIHUNCHEE**.

SESHA is, in Hindu mythology, the great king of the serpent race, on which Vishn'u reclines on the primeval waters. He has a thousand heads, which also serve as a canopy to Vishn'u; and he upholds the world, which rests on one of his heads. His crest is ornamented with jewels. Coiled up, Sessa is the emblem of eternity. He is often also called *Vāsuki* or *Ananta*, the eternal.

SESOSTRIS, the Greek name of a celebrated Egyptian monarch, who is supposed to have conquered all Asia and Ethiopia. His name has passed into the series of those conquerors who have almost achieved universal empire. According to the Greek legendary history, when Sesostris mounted the throne of Egypt, he began his scheme of conquest, first dividing Egypt itself into 36 nomes, placing his brother as regent, and laying on him injunctions not to assume the diadem, or interfere with the royal harem. Sesostris

then marched at the head of a large army, and invaded Libya, Arabia, Asia, penetrating further e. than Darius. Advancing through Asia Minor, he invaded Europe, and subdued Thrace and Scythia, leaving a colony at Colchis on his return. In the s. he subdued Ethiopia, and placing a fleet on the Red sea, conquered the adjacent isles, and extended his dominions to India itself. On his return to Egypt from his northern campaigns, his brother, who had disobeyed his instructions, endeavored to destroy him by inviting him to a banquet at Daphnæ, and treacherously attempting to burn him and his whole family by firing the house. Sesostris threw two of his children into the fire, and making a bridge of their burning bodies, escaped. Sesostris, in his triumphs, dragged his captives attached to the wheels of his chariot. The captives were employed on the public works, the enlargement of the Hephæsteum at Memphis (q.v.), and other temples, and in the construction of canals and mounds. Memorials of his reign, it was said, were left as steles or tablets in the conquered countries: and Herodotus saw some in Palestine, which are supposed to be the tablets of Ramesses II. (see RAMESES), still existing in the pass of Nahr-el-Kelb, or the Lycus, and the sculptured rock at Nymphi, near Smyrna. Sesostris is said to have grown infirm and blind after a reign of 33 years, and to have ended his days by his own hand.

Not only does the greatest confusion and difficulty about identifying this monarch exist among modern, but also in the classical authors. Herodotus places his reign long before that of Cheops of the 4th dynasty. Dicæarchus makes him rule 3712 B.C., and is followed by Aristotle and other authors. Bunsen supposes that there were more than one monarch of this name, and that one was Tosorthos, of the 3d dynasty; another, Sesortesen II., of the 12th dynasty. Lepsius conjectures that he is the Sethos I. and Ramesses II. of the 19th dynasty. But the exploits of Sesostris seem to be a conglomeration of the conquests of the kings of the 18th and 19th dynasties, especially the Thothmes and Ramesses (q.v.), who extended the empire of Egypt far to the w. and east. No one monarch of the Egyptian monarchy can represent Sesostris. Herodotus, ii. c. 102; Diodorus, i. c. 55-57; Val. Flaccus, v. 419; Strabo, xvi.; Wilkinson, *Mann. and Cust.* i. 99-106; ii. 70; iii. 190; Lepsius, *Einleit.* s. 278; Bunsen, *Aegyptens Stelle*, book ii. 85, 86, 312-324.

SESQUIALTERA, one of the compound stops of the organ, composed of either five, four, three, or two ranks of open metal-pipes tuned in thirds, fifths, and octaves to the diapason.

SESSA, a city of southern Italy, province of Caserta, about 32 m. n.n.w. of Naples. It has a fine cathedral, a theological seminary, and a college. The city is famous for its wine. The neighboring soil is fertile. Sessa is a very ancient city; it was the capital city of the Aruncii, was afterward colonized by the Romans in 439 B.C., and was very flourishing under the Roman empire. It was raised to a duchy in the middle ages. Pop. '81, 5864; commune, 19,547.

SESSION, COURT OF. See COURT OF SESSION.

SESSIONS. See JUSTICE OF THE PEACE, QUARTER SESSIONS.

SESTER TIUS, a Roman coin, was the fourth part of the *denarius* (q.v.), and thus contained at first $2\frac{1}{2}$ *asses* or *libre*. The name is an abbreviation of the Latin *semitertius*, which was their mode of expressing $2\frac{1}{2}$; and their custom was, to derive the names of all their coins from the foundation of their money-system, the *as* (q.v.). The symbols for it were indifferently HS or IIS, the former being only a modification of the latter, which expresses two units, and S for the additional half-unit (*semitis*). In the Latin classics the phrase *sestertius-nummus*, or merely *nummus*, is frequently employed to denote this coin. When the *denarius* (q.v.) was made to contain 16 *asses*, the relation between it and the sestertius was preserved, and the latter from that time contained 4 *asses*, though the name, which was now no longer significant, was preserved. Up till the time of Augustus, when the relation of the *denarius* to the *as* was changed, the sestertius was worth about four cents of our money, but after this period it was somewhat further reduced. The sum of 1000 sestertii was called *sestertium* (after Augustus, = abt. \$50), which was the "money of account" (never a "coin") used in the reckoning of large sums of money.

SESTO FIORENTINO, a t. in Italy, province of Florence, with a pop. '81, of 4996, with commune, 14,224. Within its limits is the parish of Colonnata, containing a celebrated manufactory of porcelain. There are also manufactures of hats and cloths.

SESTRI LEVANTÉ, a seaport of n. Italy, province of Genoa. It is situated on a little bay near the mouth of the Gromolo, and has some copper mines. Its church of the nativity has some valuable paintings. Pop. '81, 2492; commune, 9650.

SESTRI PONENTÉ, a t. of n. Italy, 3 m. w. of Genoa, stands on the high-road which runs along the sea-coast. It manufactures ships, bricks, and tobacco. Pop. '81, 10,872.

SETARIA, See MILLET.

SETH, ANDREW, a Scottish philosopher, was born Dec. 20, 1856, at Edinburgh; was educated there and in Germany; became professor of logic, rhetoric, and metaphysics at St. Andrews 1887. He has published *The Development from Kant to Hegel* (1882); *Essays in Philosophical Criticism* with R. B. Haldane (1883); *Scottish Philosophy* (1885); *Hegelian-*

ism and Personality (1887). In 1891 he was made professor of logic and metaphysics in the university of Edinburgh.

SETHE, See COAL-FISH.

SETHITES, the name given to an obscure Gnostic sect of the 2d c., allied to the Ophites, or worshippers of the serpent; they belonged to that class of religionists who, in evolving what they regarded as their system, approached paganism. Accepting the Christian mode of thought and its terminology, they utterly disregarded the great facts of Scripture history, maintaining that Seth reappeared in the person of the Messiah, and affirming that they possessed books written by him.

SETI, or **SETHOS**, the name of two Egyptian kings. Seti I., son of Ramesses I. (q.v.), and father of Ramesses II. (q.v.), was the first ruler of the nineteenth dynasty, and ruled for about 27 years. Seti II., son of Menepthah, and grandson of Ramesses II., was the fourth king of the same dynasty.

SET-OFF, in law, the amount of debt due to a defendant from a plaintiff which the former is allowed to interpose as a defense to all or part of the plaintiff's demand. The plea of set-off must describe the debt with as much precision as if it were a declaration. An unliquidated or indefinite claim for damages cannot be put forward as set-off, and there must be *mutuality* between the two claims. Thus if A sues B for a debt, B cannot introduce as set-off a debt due him by A, C, and D, *jointly*. But an exception exists in the case of a trustee or *cestui que trust*.

SETON, in surgery, is an artificially produced sinus or channel, through which some substance—e.g., a skein of cotton or silk, or a long flat piece of india-rubber or gutta-percha—is passed so as to excite suppuration, and to keep the artificially formed openings patent. (The term is, however, very often employed to designate the inserted material.) Setons are established in the subcutaneous tissue of the body (1) as counter-irritants, or (2) to act as a drain on the system at large, or (3) to excite inflammation and adhesion. For the purposes of counter-irritation, setons are usually inserted in the neighborhood of the affected parts; but when intended to act as a drain on the system at large—e.g., in threatened head-affections—the nape of the neck is the part always selected. The operation is very simple. A longitudinal fold of skin over the spines of the cervical vertebrae is raised by the fingers from the deeper structures, and is transfixed by the seton-needle rather obliquely, so that one of the openings shall be rather more dependent than the other. The needle must pass somewhat deeply through the subcutaneous tissue, as, if it passed immediately beneath the skin, the latter would probably slough over the whole track of the wound. The inserted material should be smeared with oil, and may be allowed to remain undisturbed for four or five days, till there is a free discharge of matter, after which a fresh portion should be drawn daily through the wound. For the purpose of exciting local inflammation and adhesion (which is the result of the inflammation) setons are employed in the treatment of hydrocele, enlarged bursæ, ranula, bronchocele, ununited fractures, etc. In the two last-named cases, their use is, however, not unattended by danger.

SETON, ELIZABETH ANN (BAYLEY), 1774-1821; b. New York; accompanied her husband to Italy in 1803, and on his death at Pisa, returned to New York; became a Roman Catholic in 1805; taught a school in Baltimore, 1805-08. Having received a large amount from the Rev. Samuel Cooper, and being joined by her sisters-in-law, Harriet and Cecelia Seton, she established the sisters of charity, the first in the United States. They assumed the religious habit and opened a Convent at Emmitsburg, Md., in 1809. In 1812 the sisterhood numbered 20 members, and Mother Seton was chosen superior-general. In 1817 the institution was incorporated by the legislature of Maryland. At the death of the superior there were 50 members.

SETON, ROBERT, D.D., b. (of American parents) Pisa, Italy, 1839; was educated in the U. S. and Italy; graduated as a D.D. from the Roman univ., 1867, and was private chamberlain to Pope Pius IX., and domestic prelate and apostolic prothonotary of the holy see. He has been rector of St. Joseph's Rom. Cath. church in Jersey City, N. J., since 1876. He has published *Memoir, Letters and Journal of Elizabeth Seton*, 1869 (the founder of the sisters of charity in the U. S.), whose grandson he is; and *Essays on Various Subjects, chiefly Roman*, 1882.

SETON HALL COLLEGE, South Orange, Essex co., N. J., a Roman Catholic institution; organized in 1856. Its course of study extends through a term of seven years. It has a fine situation, excellent buildings, and a library of 20,000 volumes. Professors, '97, 17; students, 125. Very Rev. Joseph J. Synnott, D.D., President.

SETTE COMMUNI DI VICENZA, a district consisting of seven communes or parishes in the province of Vicenza, Italy, the language and population of which are plainly Teutonic, and have maintained themselves pure and unmixed in the midst of a Latin people from the days of the Roman republic. The inhabitants are believed by antiquaries to be descendants of the remnant of the Cimbrian army which was defeated with great slaughter by Marius, and are supposed to have escaped to the mountains, and there fixed a permanent settlement. Their language is perfectly intelligible to any German scholar. Specimens of this dialect, and of a similarly isolated Teutonic dialect which is found near Verona, are given by Adelung in the *Mithridates*, ii. p. 215.

SETTER. a kind of dog which derives its name from its habit of *setting* or crouching when it perceives the scent of game, instead of standing, like the pointer. Setters, however, are now trained to adopt the pointer's mode of standing while marking game. The setter was originally used to assist in the capture of game by the net. It is supposed to derive its origin from a mixture of the pointer and the spaniel. It is larger than the spaniel; its hair is less smooth than that of the pointer, and has more of the waved character of that of the spaniel, to which there is a resemblance also in the ears. The tail is bushy. There are several breeds of the setter. The general color of the *English setter* is a white ground, with large spots or blotches of liver-color or red. The *Irish setter* has larger legs in proportion to the size of the body. The *Scotch* or *Gordon setter* is of a rich black-and-tan color. The *Russian setter* is covered with woolly fur, much matted together. Each of these breeds has its peculiar merits. All setters have the soles of the feet well covered with hair, so that they can bear hard work on rough ground. They soon become exhausted, however, unless they have access to water. The setter is much employed by sportsmen. It is one of the most affectionate, gentle, and intelligent of dogs.

SETTLE, ELKANAH, was b. at Dunstable, in the year 1648. He completed his education at Trinity college, Oxford, which he left without taking a degree, and repaired to London, to seek his subsistence by literature. In 1671 he made something of a hit by the production of his tragedy of *Cambyzes*; and the earl of Rochester and others, wishing to annoy and insult the great Dryden, loudly hailed in him the superior genius of the two. Through the influence of Rochester, to his next tragedy, *The Empress of Morocco*, the unwonted honor was accorded of being played at Whitehall by the lords and ladies of the court, and in this way a great run was secured for it when it came before the general public. In the insolence of success, the author printed along with it a preface, in which Dryden was severely assailed. Solely in virtue of the quarrel thus engendered is Settle now remembered. In his great satire, *Absalom and Achitophel*, Dryden scourged him with his scorn, so that in some sort he survives for us, if only as a shrieking ghost. Having no real strength of talent, he speedily relapsed into obscurity. The post of poet-laureate for the city he had obtained, and he continued to retain. By writing in this capacity verses for city pageants and festivities, and producing pieces to be acted in the booths of Bartholomew fair, the some-time rival of Dryden was fain to eke out a wretched subsistence. In his destitute age, he was admitted to the Charterhouse, where in 1723 he died, his works having predeceased him.

SETTLED ESTATE, in English law, means an estate held by some tenant for life, under conditions more or less strict, defined by the deed.

SETTLEMENT, in English law, is used in two senses. In one case it means the mode of securing property on married parties, so as to regulate the succession in the event of the death of either, or it may regulate the succession of parties not married. In poor-law matters it means that kind of right which a pauper has to support by the parish by reason of his being born there, or of his renting a tenement or acquiring estate, etc. It often happens that a person becomes chargeable, that is, is entitled to be relieved by a parish in which he has no settlement, and the relieving parish can forthwith remove him to his parish of settlement. See **REMOVAL OF PAUPERS**. In Scotland, settlement, besides the above meanings, also means the general will or disposition by which one regulates the disposition of his property after death. As to settlement of paupers, see **POOR LAWS**. Marriage settlements may be made before and in consideration of the marriage, or after it. They vest the property in trustees, generally for the use of the husband and wife during their joint lives, then for the use of the survivor of them, and then for the children by the marriage. Marriage is a valuable consideration at law, and will support an agreement by a third person, though a stranger, to make a settlement upon the husband and wife and their issue. A marriage settlement made without consideration, after marriage, settling the husband's property upon the wife and children, is good against subsequent creditors, but void as to creditors at the time of settlement. The ordinary powers in marriage settlements of real estate are powers of sale and exchange, of leasing and managing, and of raising portions and jointuring.

SETUBAL (frequently and erroneously called by the English **ST. UBE'S**) is an important sea-port city of Portugal, in the province of Estremadura, 20 m. s.e. of Lisbon. It stands on the n. side of the bay of Setubal, which forms a good harbor. The harbor is furnished with a light-house and with broad and handsome quays, and is protected by two forts; but the valley in which the town itself stands is completely commanded by the heights in the vicinity. The main imports are coal, oil and tin plate; exports, salt, sardines, oranges, corks, and wine. There are manufactures of lace, corks, and stoppers. Setubal is the old Roman *Cetobriga*. In 1755 it was visited by an earthquake, from which it suffered severely. Pop. '90, 16,986.

SEVASTOPOL, or, as it is sometimes written, **SEBASTOPOL** (*Sebastopolis*, the "august city"), a Russian seaport, fortress, and arsenal in the Crimea, in the government of Taurida. It is situated near the s.w. extremity of the Crimea, on the southern side of the

magnificent harbor or roadstead of Sevastopol, one of the finest natural harbors in the world. This harbor is an inlet of the Black sea, stretching inland for about $4\frac{1}{2}$ m. from w. to e., about half a mile wide at the entrance, but immediately opening out to the width of a mile, with an average width of about half a mile up to the eastern end. It is sheltered on the n. and s. by lofty limestone ridges shutting it completely in, with a depth of water varying from 3 to 11 fathoms, and sufficient in several places to allow ships of the largest size to lie close to the shore. At the eastern end, under the heights of Inkermann, the river Tchernaya enters the harbor through low marshy ground. The South bay, or Dockyard harbor, as it is also called, extending about one and a half miles from n. to s., forms the harbor proper of Sevastopol; and between it and Quarantine bay, occupying rather more than half the peninsula thus formed, is built the chief portion of the town of Sevastopol, on ground sloping irregularly upward. The town, previous to its destruction in the siege of 1854-55, was well and substantially built of stone, with lines of streets running from n. to s., and smaller ones intersecting them at right angles, containing several handsome public edifices. The docks, constructed for the Russian government by Col. Upton, an English civil engineer, were among the most important works at Sevastopol; the dock-basin, docks, and quays were formed in the most substantial way, being partly cut in the solid rock, and lined with cement, partly built of limestone and granite. From the dockyard creek, ships were admitted into the dock basin by means of three locks, the bottom of the docks being above the sea level, and the basin was supplied with water by a canal some 12 m. in length from the Tchernaya above Inkermann—itself a work of no inconsiderable magnitude. For the defense of town and harbor from attack by sea, several forts were erected. These forts were works of immense strength, built of limestone faced with granite, on which artillery was found to make but little impression; they mounted a very large number of guns, and by their cross-fire completely protected every spot accessible to a hostile fleet. On the land side, with the exception of a slight loop-holed wall extending partially round the western side, the town, previous to the siege, was entirely undefended; but the earthworks and fortifications then successively extemporized by the genius of Gen. Todleben, which for so many months kept the armies of France and England at bay, and of which the Malakoff and the Redan were the most formidable, are now of historic fame.

The siege of Sevastopol by the allied English and French armies will rank among the most famous sieges in history; it lasted for 11 months, from Oct., 1854, to Sept., 1855; the place sustained repeated bombardments, the first of which took place Oct. 17, 1854; and the capture of the Malakoff and Redan, on Sept. 8, 1855, at length forced the Russians to evacuate it, and retire to the n. side. The town was completely ruined; the docks and forts still standing were blown up by French and English engineers, and by the treaty of Paris (1856) were not to be restored; but the restrictions were removed by the abrogation of the neutrality of the Black sea by the conference of London (1871). Before the siege the population of Sevastopol, including the garrison, amounted to about 40,000. Since, the town has been partially rebuilt, and the population in 1897 was 54,442. Sevastopol was intended to be the station of the Russian Black Sea fleet, and as such to form a standing menace to Turkey; during the siege the fleet was almost entirely destroyed, many of the ships having been sunk by the Russians across the entrance of the harbor by way of defense. The great disadvantage of Sevastopol as a naval station arises from the ravages of the *teredo navalis*, which soon render wooden vessels unseaworthy. Sevastopol was founded on the site of a small Tartar village called *Akhthiar*, immediately after the Russian conquest of the Crimea in 1783, under the orders of the empress Catherine II. The promontory on which Sevastopol stands is a spot of considerable classical and historical interest. Here, perhaps on the site now occupied by the Greek convent of St. George, w. of Balaklava, stood the temple of the Tauric Artemis, in which, according to the legend, Iphigenia, daughter of Agamemnon, was priestess.

SEVEN, frequently used as a mystical and symbolical number in the Bible, as well as among the principal nations of antiquity (the Persians, Indians, Egyptians, Greeks, Romans, etc.). The reason for the preference of this number for sacred use has been found in its consisting of *three*—the number of the sides of a triangle—and *four*—the sides of a square, these being the simplest rectilinear figures;—or in other equally vague circumstances. The real reason, however, seems to be astronomical, or rather astrological, viz., the observation of the seven planets and the phases of the moon—changing every seventh day. (See WEEK.) As instances of the use of this number in the Old Testament, we find the creation completed in seven days, wherefore the seventh day was kept sacred; every seventh year was sabbatical, and the seven times seventh year ushered in the jubel-year. The three *regalim*, or pilgrim festivals (passah, festival of weeks, and tabernacles), lasted seven days; and between the first and second of these feasts were counted seven weeks. The first day of the seventh month was a "holy convocation." The Levitical purifications lasted seven days, and the same space of time was allotted to the celebration of weddings and the mourning for the dead. In innumerable instances in the Old Testament and later Jewish writings, the number is used as a kind of round number. In the New Testament we have the churches, candlesticks, stars, trumpets, spirits, all to the number of seven; and the seven horns, and seven eyes of the Lamb. The same number appears again either divided into half ($3\frac{1}{2}$ years, Rev. xiii. 5, xi. 3, xii. 6, etc.), or multiplied by ten—seventy

Israelites go to Egypt, the exile lasts seventy years, there are seventy elders, and at a later period there are supposed to be seventy languages and seventy nations upon earth. To go back to the earlier documents, we find in a similar way the dove sent out the second time seven days after her first mission. Pharaoh's dream shows him twice seven kine, twice seven ears of corn, etc. Among the Greeks the seven was sacred to Apollo and to Dionysos, who, according to Orphic legends, was torn into seven pieces; and it was particularly sacred in Eubœa, where the number was found to pervade, as it were, almost every sacred, private, or domestic relation. On the many ancient speculations which connected the number seven with the human body and the phases of its gradual development and formation, its critical periods of sicknesses—partly still extant as superstitious notions—we cannot here dwell. The Pythagoreans made much of this number, giving it the name of Athene, Hermes, Hephaistos, Heracles, the virgin unbegotten and unbecoming (i.e., not to be obtained by multiplication), Dionysos, Rex, etc. The "seven sacraments," the "seven free arts," the "seven wise men," and many more instances, prove the importance attached to this number in the eyes not only of ancient but even of our own times. That it played an immense part in the superstitions of the middle ages need hardly be added.

SEVEN CARDINAL VIRTUES, THE, as enumerated by Augustine, one of the early Fathers of the Romish Church, were faith, hope, charity, prudence, temperance, chastity, and fortitude.

SEVEN CHAMPIONS OF CHRISTENDOM, THE, are seven men of the early days of Christianity eminent for their piety and good works. They are frequently alluded to by the old writers, and are familiar in history as the patron saints of different countries. They are St. George of England, St. Andrew of Scotland, St. Patrick of Ireland, St. David of Wales, St. Denis of France, St. James of Spain, and St. Anthony of Italy. Each of these will be found fully treated under his respective title: *The Famous History of the Seven Champions of Christianity* is the name of a romance written by Richard Johnson, about the beginning of the seventeenth century.

SEVEN CHURCHES OF ASIA is used in the Book of Revelation to specify the early christian churches of Asia Minor. See Rev. I., ii. They were located at Ephesus, Pergamos, Smyrna, Sardis, Thyatira, Philadelphia, and Laodicea.

SEVEN DEADLY SINS, THE, as enumerated by St. Augustine (q.v.), were pride, avarice, anger, gluttony, unchastity, envy, and sloth. Deadly sins were those for which formal ecclesiastical penance was deemed necessary to save sinners from everlasting punishment, and are opposed to venial sins (q.v.), for which he might obtain forgiveness by prayer and fasting. Some of the early writers added an eighth sin to the list, which was variously selected from vain-glory, gloominess, and languid indifference, but the decided preference of the writers of those days, for the so-called "mystical numbers," finally placed the number at seven, where it has since remained.

SEVEN DIALS is a name given to a locality in St. Giles, London, formerly noted as being the resort of the most wretched and degraded classes in the city. Seven streets radiate from a circular area on which formerly stood a pillar bearing a dial having seven faces. This pillar was removed in 1773.

SEVEN DOLORS OF THE BLESSED VIRGIN MARY, FEAST OF, a modern festival of the Roman Catholic church, which, although bearing the name of devotion to the virgin Mary, in reality regards those incidents in the life and passion of Christ with which his mother is most closely associated. This festival is celebrated on the Friday preceding Palm Sunday (q.v.). The "dolors" or sorrows of the Blessed Virgin have long been a favorite theme of Roman Catholic devotion, of which the pathetic *Stabat Mater Dolorosa* is the best known and most popular expression; and the festival of the seven dolors is intended to individualize the incidents of her sorrows, and to present them for meditation. The seven incidents referred to under the title of "dolors" are: 1. The prediction of Simeon (Luke ii. 34); 2. The flight into Egypt; 3. The loss of Jesus in Jerusalem; 4. The sight of Jesus bearing his cross toward Calvary; 5. The sight of Jesus upon the cross; 6. The piercing of his side with the lance; 7. His burial. This festival was instituted by pope Benedict XIII. in 1725.

SEVEN PINES, BATTLE OF. See CHICKAHOMINY.

SEVEN SLEEPERS, the heroes of a celebrated legend, which is first related by Gregory of Tours in the close of the 6th c. (*De Gloria Martyrum*, c. 95), but the date of which is assigned to the 3d c., and to the persecution of the Christians under Decius. According to the narrative, during the flight of the Christians from the persecution, seven Christians of Ephesus took refuge in a cave near the city, where they were discovered by their pursuers, who walled up the entrance, in order to starve them to death. A miracle, however, was interposed in their behalf; they fell into a preternatural sleep, in which they lay for nearly 200 years. The concealment is supposed to have taken place in 250 or 251; and it was not till the reign of Theodosius, 447, that they were reanimated. On awakening, they imagined that their sleep had been but of a single night; and on one of the party (supposing the persecution still in progress) going into the city to purchase provisions privately, he was amazed to find erected in triumph on the churches and other buildings, a cross, which, as it seemed, but a few

hours before, he had seen the object of contempt and blasphemy. When their wonderful history became known, they were conducted in triumphant procession into the city of Ephesus; but they all died at the same moment, as if by one common and mysterious destiny. The same legend reappears with variations at later periods.

SEVENTEEN-YEAR LOCUST. See LOCUST, GRASSHOPPER.

SEVENTH-DAY ADVENTISTS (see ADVENTISTS, SEVENTH-DAY), a sect whose peculiar views of prophecy were developed in 1845, just after the great Advent excitement of 1840-44. Elder James White and wife, and elder J. N. Andrews, of Maine, with elder Joseph Bates, of Mass., were the pioneers of this denomination. The first church was formed in Washington, N. H. In 1849 elder James White commenced publishing in connection with this movement. In 1855 this publishing work was removed to its present location, Battle Creek, Mich.; and in 1861 a legally incorporated association was formed under the title of the Seventh-day Adventist publishing association. Four buildings, the central one a large brick structure, are used in printing, electrotyping, binding, and other branches of the work. Nine power-presses and 100 hands are regularly employed in the publishing house, from which are issued 2 weeklies and 2 monthlies in English, 1 semi-monthly in Danish, 1 monthly in German, 1 in Swedish, and a quarterly in the Holland language. Their denominational literature embraces 18 bound books, and numerous tracts and pamphlets, many in the foreign languages above named. They had issued before the autumn of 1880, 230,000,000 pp. of books, pamphlets, and tracts. They also have a large and equally well-equipped publishing house at Oakland, Cal., from which is issued weekly *The Signs of the Times*. They publish a monthly in French at Bâle, Switzerland, and a semi-monthly in Danish at Christiania, Norway. The aggregate monthly circulation of their periodicals is about 85,000 copies.

The government of the denomination is administered by a general conference and 24 state conferences, having under their charge 600 churches with 14,000 members besides whom several thousands living in many parts of the country have as yet no organized church near them with which they can unite. The amount pledged to the Benevolence fund in 1879 was \$51,714. The churches being without settled pastors and maintaining religious services with only occasional ministerial help, the preachers are free to devote themselves chiefly to missionary work. During the summer months they hold meetings in large tents, 70 of which were used in 1879. They have a college and sanitarium at Battle Creek.

Seventh-day Adventists are distinguished from the denominations known as evangelical principally on the three following points: First, the Sabbath, which they hold to be still the seventh day of the week, as ordained in Eden; secondly, the prophecies, which they believe to teach that the second coming of Christ, personally and premillennially, is near at hand; and, thirdly, the nature of man, which they hold to be such as to show that he has no immortality out of Christ. The founders of the denomination were strenuous opposers of the use of alcoholic liquors as a beverage, and of tobacco and other narcotics; and, as the fruit of efforts then begun, the whole denomination are abstainers from the use of alcoholic drinks of all kinds. Tobacco, in all its forms, is also discarded, none addicted to the use of it being received into the churches unless they promise to abandon it immediately. Besides abstinence from these things, which is made a condition of fellowship, other useful reforms are strongly advocated. Articles of diet which experience shows to be unwholesome are little used. Meat is seldom eaten; grains, vegetables, and fruits are the staple articles of food. The reform aimed at is not limited to diet and drink. As the health of the body is greatly affected by the manner in which it is clothed, the subject of dress receives much attention. See ADVENTISTS, SEVENTH-DAY.

SEVENTH-DAY BAPTISTS. See SABBATH; BAPTISTS, SEVENTH-DAY.

SEVEN WISE MASTERS is the title of a mediæval collection of novels, important both from its contents and its widespread popularity. The idea of the work is as follows: A certain prince's son, instructed in all kinds of wisdom by seven sages, finds, from an examination of the stars, on his return to his father's court, that he is in danger of losing his life, if he speaks a word within seven days. His stepmother, whose allurements he had repelled, endeavored in revenge to persuade his father to put him to death, and each day related an artfully constructed story, with the view of furthering her wicked purpose, but its effect was daily neutralized by a rival narrative told by each of the sages. At last, on the expiry of the seven days, the prince himself was enabled to disclose the base designs of his stepmother.—The work is undoubtedly of oriental origin, yet neither the period when it was composed, nor how far it spread through the east, can be ascertained with sufficient accuracy. According to Masudi, it existed in Arabic as a translation from Indian sources before the 10th c., but none of the extant Arabic versions go back so far. Nearest to the original form appears to stand the *Eight Nights* of Nakhschebi, a Persian adaptation of the Indian *Tutiname* (Brockhaus, Leip. 1845). It passed into the literature of western Europe in the 11th or 12th c., through the medium of two redactions, a Hebrew and a Greek, the latter by Andreopulos, under the title of *Syntipas* (see *Das Buch von den sieben weisen Meistern*, translated from the Hebrew and Greek by H. Sengelmann, Halle, 1842; *Syntipas* being republished by Boissonade, Paris, 1828). The work was disseminated through Christendom; sometimes in a complete form; sometimes only particular novels were repro-

duced, under all sorts of names, and with all sorts of modifications; sometimes in verse, sometimes in prose. Latin versions began to appear about the beginning of the 13th c., and Keller has published a French metrical one, from a MS. of 1284 (*Li Romans des Sept Sages*, Tüb. 1836), and Henry Weber an English metrical one (third vol. of the *Metrical Romances*, Edin. 1810). There are several German versions, dating from the 14th century. In the 15th c. a popular German chapbook, *Von den sieben weisen Meistern*, was frequently reprinted (the first edition is dated Augsb. 1473), and is included by Simrock in his collection of German *Volksbücher*.

SEVEN WISE MEN, the collective designation of a number of Greek sages, who lived about 620-548 B.C., and devoted themselves to the cultivation of practical wisdom. Their moral and social experience was embodied in brief aphorisms, sometimes expressed in verse, sometimes in prose. The names of the seven, as usually given, are Solon (q. v.), Thales (q. v.), Pittacus (q. v.), Bias (q. v.), Chilon, Cleobulus, and Periander of Corinth; but there is not absolute unanimity among the ancients either as regards the names, the number, the history, or the sayings of these famous sages. The fragments of wisdom attributed to them which have come down to us are to be found in Orelli's *Opuscula Græcorum Veterum, Sententiosa et Moralia* (Leip. 1819), and have been translated into German by Dilthey in his *Fragmente der sieben Weisen* (Darmstadt, 1835).

SEVEN WONDERS OF THE WORLD were, in ancient times, reckoned to be the Pyramids of Egypt, the hanging gardens of Semiramis at Babylon, the temple of Diana at Ephesus, the statue of Jupiter at Olympia by Phidias, the Mausoleum (q. v.), the Colossus (q. v.) at Rhodes, and the Pharos of Alexandria. This cycle of seven wonders originated among the Greeks after the time of Alexander the Great, and they were described in a special work by Philo of Byzantium, which has been edited by Orelli.

SEVEN YEARS' WAR, THE, was the third, last, and by far the longest (1756-63) and most terrible of the contests for the possession of Silesia (q. v.). During the two former wars, the empress Maria Theresa had plenty of other work on hand in maintaining her claims to the Austrian dominions (see **SUCCESSION, WAR OF AUSTRIAN**) to offer any very effective resistance to the aggression of Frederick the Great of Prussia; but after emerging triumphantly from this contest she took advantage of the circumstance that the king of Prussia was on bad terms with all the chief continental powers except Turkey and Spain, to renew the struggle for Silesia, which had been snatched from her at the moment of her greatest straits. She found the czarina Elizabeth, the king of Poland and elector of Saxony, and Louis XV. of France (or rather Madame de Pompadour), ready to enter into an offensive and defensive treaty with her. On the other hand, Britain (then at war with France) engaged to assist Prussia with an army in Hanover, and with subsidies when necessary. Resolving to anticipate his enemies, and secure a safe basis for future operations, Frederick made a sudden advance (Aug., 1756) on Dresden with 60,000 men, took possession of the country, which he governed from this time with slight intervals to the end of the war, and cooped up the Saxon army, 18,000 strong, between Pirna and Königstein. On the Austrians under Browne advancing to relieve their allies, they were met by Frederick at Lobositz (Oct. 1), and after an indecisive contest were obliged to retreat. The Saxons then surrendered (Oct. 14), and were mostly incorporated with the Prussian army, which went into winter-quarters in Saxony and Silesia.—The *second campaign* (1757) began under more favorable auspices for the Austrian coalition, as the rapid action of Frederick had taken it somewhat by surprise in the preceding autumn; besides, Sweden (subsidized by France) became a fourth in the coalition, in order to recover Pomerania, and the German reich or empire raised an army, 33,000 strong, to assist Austria. A combined attack was now made by a French army (100,000) on Hanover; another French army (30,000) on Hesse-Cassel (an ally of Prussia), with a view to reach Saxony; an Austrian army from Bohemia on Saxony and another on Silesia, both of them at first united under marshal Daun, but latterly (1760) separated, under Daun and Loudon; the Russians (100,000) on the e. and n.e.; and the Swedes (22,000) in Pomerania; while the imperial army sometimes joined the southern French, and sometimes the w. Austrian armies. To oppose these armies, numbering in all 430,000, Frederick had the combined British-Hanoverian-Hessian army (60,000) in Hanover, and a Prussian army of 200,000 strong, which was distributed, as need required, over the various points attacked; but he relied much on the rapidity of his movements and the harmonious completeness of his plans. In April, Frederick, leaving a corps of 24,000 under Lewald to resist the Swedes and Russians, invaded Bohemia, drove in the advanced corps of the Austrians upon their main army, which he then completely routed at Prague (May 6), with a loss on his side of 18,000, and of 19,000 on the part of the Austrians. Marshals Schwerin (Prussian) and Browne (Austrian) fell in this conflict. Frederick immediately invested Prague, to which prince Charles of Lorraine, with 46,000 men, had retreated; but Daun, who advanced from Moravia to its relief, inflicted on the Prussians a crushing defeat at Kolin (June 18), and forced them to retire from Bohemia. The n. French army had meanwhile, under Marshal d'Estrées, advanced into Hanover, defeated the incapable duke of Cumberland at Hastenbeck (July 26), and compelled him to capitulate, on condition that the whole of his army, excepting the Hanoverians, should be disbanded. But the British government refused to ratify this shameful treaty, and speedily raised another army of similar com-

position, which was placed under the command of Duke Ferdinand of Brunswick, an able leader, who again drove back the French, and proved himself so capable to hold them in check, that Frederick ceased to have any apprehensions from this quarter. The s. French army under Soubise had also advanced in conjunction with the imperialists under the prince of Hildburghausen in the direction of Saxony, but Frederick was not prepared to lose this valuable vantage-ground, and falling upon them at Rossbach (q. v.) (Nov. 5), he put them completely to rout. During his absence, however, the Austrians had broken into Silesia, routed his armies, and compelled them to retire; so, compelled to use the utmost expedition in returning, he collected a small army, defeated a thrice as numerous force of Austrians under prince Charles of Lorraine at Leuthen (Dec. 5), and recovered Silesia. On the e. the Russians had appeared in great force, captured Memel, committing the most horrible devastations, and had routed Lewald at Grossjägerndorf (Aug. 30), when the change of Russian policy due to the illness and apparently impending demise of the czarina, caused them to relinquish almost all their conquests; Lewald then attacked and defeated the Swedes, driving them under the walls of Stralsund. Thus closed the second campaign, leaving matters very much as they were at the commencement.—Duke Ferdinand opened the *third campaign* (1758) by driving the French from lower Saxony, pursued them across the Rhine, and defeated them near Krefeld (June 23); but Contades, the new French commander, having obtained the co-operation of Soubise, compelled him to retrace his steps, till, receiving a re-enforcement of 12,000 British, Ferdinand again advanced, throwing Contades between the Rhine and Meuse, and Soubise between the Rhine and Main. Meanwhile Frederick had not been idle, for after being driven out of Moravia (which he had invaded in spring) by Daun, he marched northward with a portion of his army to meet the Russians, who, the czarina having recovered, had again invaded Brandenburg, and defeated them in a desperate battle at Zorndorf (Aug. 25), compelling them to retreat into Poland. Frederick's presence was next needed in Saxony, where his brother, prince Henry, was being hard pressed by Daun with superior forces; but on his arrival the Austrians retreated eastward till Oct. 14, when Daun turned, took Frederick completely by surprise, and gave him a severe defeat at Hochkirch (q. v.), though before the end of the year the Prussians were again in possession of Saxony. Thus passed another campaign with a slight advantage to the Prussians.—The *fourth campaign* (1759) (preceded by fruitless attempts at negotiation with France, on the part of Frederick), though signalized by only two great actions, was more unfortunate for Prussia. The French under Soubise had captured Frankfurt during the winter, and the duke of Brunswick, in attempting to recover it, was defeated at Bergen (April 13), by Broglie (the successor of Soubise), and compelled to resign the whole of Hesse to the French; but later in the year, his signal victory at Minden (Aug. 1) over Contades and Broglie, and that of his relative, the hereditary prince of Brunswick, at Gohfeld on the same day, recovered most of Westphalia, and drove the southern French beyond the Lahn and Rhine. But in the Saxon district, although prince Henry invaded Bohemia (April), capturing immense supplies, and cleared Franconia (May) of Austrians and imperialists, he subsequently evacuated Saxony, which was then occupied by the imperialists, and Loudon's Austrians advanced into Lusatia. In Silesia Fouqué gallantly kept the Austrians at bay; and Dohna continued to coop up the Swedes about Stralsund, keeping at the same time an eye on the Russians; but the latter soon gathered in such force that he was compelled to retreat. His successor, Wedel, in attempting to bar their advance, was routed near Züllichau (July 23), and though Frederick hastened to his assistance, attacked them at Kunersdorf (q. v.) (Aug. 12), and had almost gained the day, the arrival of Marshal Loudon with an Austrian force turned the tide, and converted this almost victory into the most signal defeat suffered by the Prussians during the whole war. On the following morning he could hardly muster 5,000 men; but, luckily, the Russians showed no inclination to follow up their victory, and by untiring perseverance, the Prussian monarch succeeded in raising another army 28,000 strong. Though it seemed almost impossible for him to prevent the meditated junction of the Russians and Austrians in Brandenburg; yet, by dint of skillful maneuvering, he succeeded in compelling the Russians to retire to Poland; and prince Henry, by cutting off their supplies, forced the Austrians into Saxony. On Nov. 21, however, he suffered a severe blow in the capture of Pinck with 11,000 Prussians, at Maxen in Saxony. With greatly diminished strength, an exhausted treasury (chiefly supplied by the English subsidy, the taxes of Saxony, and forced contributions on Mecklenburg, Saxony, and Anhalt), a desolated territory incapable of affording either men or supplies, and gloomy forebodings of the final issue, though with unflinching resolution never to yield, Frederick prepared for his *fifth campaign* (1760).—His army in Prussia, now reduced to 90,000 men, mostly foreigners and raw recruits, was still further diminished by the capture of Fouqué with 8,000 men in Silesia, followed by Marshal Loudon's conquest of that province, though the brilliant victory of Liegnitz (Aug. 15) subsequently restored him the north-western division of it; he then joined his brother, prince Henry, drove the Russians across the Oder, and Daun into Bohemia; but his strength was now becoming glaringly insufficient for the task to which he had set himself; the Russians and Austrians captured and plundered Berlin (Oct. 3); the Swedes came down from the north, and Loudon's Austrians upward through Silesia, so that he was now fairly in the toils. But, like a lion in the midst of the hunters, he turned upon

his most able and pertinacious adversary, Daun, terribly routed him at Torgau (Nov. 3) in Saxony, then drove Loudon into Glatz, and frightened away the Russians to Poland, and the Swedes to Stralsund. In the w. the fortune of Prussia was in the ascendant, and the French, defeated by prince Charles of Brunswick at Einsdorf (July 13), and by duke Ferdinand at Marburg (July 31), were again confined to Hesse.—The *sixth campaign* (1761) on the Rhine commenced still more auspiciously for Frederick, as the French were driven in detail from their strongholds, had their supplies captured, suffered defeat by the Hanoverians at Langensalza (Feb. 14), and by duke Ferdinand at Villingshausen (July 15), though in the end Broglie and Soubise again gained possession of Hesse. In Silesia Frederick attempted to bar the progress of the Austrians, so as to prevent their junction with the Russians, and so opposing 130,000 men to his poor remnant of 50,000; but in vain; however, the union was productive of no ill results to him, for scarcity of provisions speedily compelled the Russians to retreat to Poland, after which Loudon retired to upper Silesia, capturing Schweidnitz with 3,700 men on his way. In Saxony, prince Henry had to retreat before Daun, and the Prussians were ejected from Pomerania by the Russians and Swedes, all subsidies from Britain stopped by the earl of Bute after George II.'s death, and the country ravaged in all directions, so that things were now in a desperate condition, and Prussia almost at its last gasp. Frederick's assailants had cooped him up within southern Brandenburg and north-western Silesia, and though as resolute as ever to fight on, it seemed as if another campaign must bring him to final ruin. But the death of the czarina (Jan. 5, 1762) converted the most powerful of his enemies into a fast friend; Sweden, which had suffered uninterrupted reverses during the whole war, also retired from the alliance—and the *seventh campaign* (1762) commenced on equal terms, as Austria and France were almost as much exhausted as Prussia. On the refusal of Austria to submit her cause to arbitration, the czar Peter III. joined his army to that of Frederick; but his successor, Catharine II., ordered the return of the army, though her strict neutrality was of itself an immense benefit. Frederick had now no fears for the result. Nor had he any reason, as subsequent events showed, for on July 21 he drove an Austrian force from its intrenchments at Burkardorf, and following up his success, routed Daun at Reichenbach (Aug. 16), and took Schweidnitz (Oct. 9); while prince Henry, by a series of fortunate maneuvers, possessed himself of the passes of the Erzgebirge, and with the valuable aid of Seidlitz, completely overthrew the other Austrian army at Freiberg (Oct. 22); and the two Brunswicks nobly sustained the glory of Prussia at Wilhelmsthal (June 24) and Luternberg (July 23), capturing Cassel, and recovering the whole of Hesse. France now gave up a contest from which she had gathered nothing but military disgrace, and concluded treaties with Britain and Prussia; while Prussia and Austria agreed to an armistice with regard to Saxony and Silesia, of which the astute Frederick took advantage to send Kleist on a raid through Franconia and Bavaria, which had the effect of withdrawing the minor German states from the coalition. Maria Theresa was now left alone, and sorely against her will, was compelled to conclude the peace of Hubertsburg, Feb. 15, 1763, which finally acknowledged Frederick as the lord of Silesia. This long and desperate conflict made no change in the territorial distribution of Europe, but increased tenfold the moral power of Prussia, and gave its army a prestige which it retained till the battle of Jena. It cost Europe a million lives, and prostrated the strength of almost all the powers who had engaged in it.—See, for a complete account, Carlyle's *History of Frederick the Great*.

SEVERALLY, in American law, is the enjoyment by an individual of an estate in contradistinction to joint. See **JOINT AND SEVERAL**.

SEVERN, one of the most important and beautiful, and, after the Thames, the largest of the rivers of England, rises from a chalybeate spring on the eastern side of Plinlimmon, about 11 m. w. of Llanidloes, in Montgomeryshire, North Wales. Flowing eastward from its source to Llanidloes, to which town it retains its original British name of Hafren, it afterward flows n.e. to the eastern boundary of Montgomeryshire, then e.s.e., past Bridgenorth in Salop, and finally southward through Worcester and Gloucester, in which last it begins to form its estuary. It is navigable for barges to Welshpool in Montgomeryshire, 180 m. from its mouth. Its entire length is 210 m., and it drains an area of about 6,000 sq. miles. The chief affluents of the Severn are the Terne and the upper and lower Avon on the e., and the Teme and Wye on the west. A canal 18½ m. long, and navigable for vessels of 400 tons, extends from Gloucester to the upper portion of the estuary of the river, and thus materially shortens the navigation of its lower course. The Montgomery canal extends from Welshpool to Newton, and other canals establish communication between the Severn and the Thames, Trent, Mersey, and the other important rivers of the middle districts of England. The *bore*, or tidal wave, which rushes up the Severn, raises the water very considerably at Gloucester, below which embankments have been constructed along the water-course to prevent inundation. See **BRISTOL CHANNEL**.

SEVERUS, ALEXANDER. See **ALEXANDER SEVERUS**.

SEVERUS, L. SEPTIMIUS, Roman emperor, was born April 11, 146 A.D., near Leptis Magna, on the n. coast of Africa, of a family of equestrian rank; and, after receiving an excellent education, removed to Rome, where he became prætor, 178 A.D. He was subsequently commander of a legion in Gaul, and governor of Gallia Lugdunensis,

Pannonia, and other provinces. After the murder of Pertinax he was proclaimed emperor, 193 A.D., at Carnutum, and promptly marched upon Rome, where the puppet Julianus had by purchase obtained the imperial purple. His arrival before Rome was the death-signal for Julianus; and after taking vengeance on the murderers of Pertinax, converting his most formidable rival, Clodius Albinus, into an ally by creating him Cæsar, and distributing an extravagant largess to his soldiers, he marched against Pescennius Niger, and conquered him at Issus, 195 A.D. A glorious campaign in the east, and a three years' siege, followed by the capture of Byzantium, were followed by a desperate struggle with his jealous rival, Clodius Albinus, whom, after an obstinate conflict at Lyons, in which 150,000 were engaged on each side, he conquered, 197 A.D. The usual games to the degenerate citizens of Rome, and largesses to the troops, followed, after which Severus returned to Asia, accompanied by his sons Caracalla and Geta, met with the most brilliant success in the campaign of 198 A.D. against the Parthians, and took and plundered their capital, Ctesiphon. After a war with the Arabs, in which Severus's usual good fortune deserted him, and a general visit to his various eastern dominions, he returned to Rome, 202 A.D., and gratified the popular taste by the exhibition of shows of unparalleled magnificence, also distributing another extravagant largess to the citizens and prætorians. A rebellion in Britain drew him to that country in 208 A.D.; and, at the head of an immense army, he marched, it is said, to the extreme n. of the island, encountering enormous hardships, to which no less than 50,000 of his soldiers succumbed, and securing no permanent advantages. To secure to some extent the natives of s. Britain from the incursions of the Meate and Caledonians, Severus commenced the wall which bears his name, and died soon after at York, Feb. 4, 211 A.D. Severus was an able, vigorous, and just ruler, and a skillful warrior, but totally devoid of high moral sentiment, a deficiency especially observable in cases where his own interests were involved.

SEVERUS, WALL OF, a rampart of stone built by the Roman emperor Hadrian in Britain, 120 A.D., between the Tyne and the Solway. On the first subjugation of Britain by the Romans, a line of forts had been constructed by Agricola, extending from the Forth at Edinburgh to the Clyde at Dumbarton. The emperor Hadrian, on visiting Britain, 120 A.D., threw up for the protection of the Roman province a wall of turf extending across the narrowest part of the island, between Tyne and Solway. Twenty years later Antoninus Pius, whose lieutenant, Lollius Urbicus, had gained fresh advantages over the northern tribes, endeavored to check the inroads of the Caledonians by erecting another rampart of earth between the Forth and Clyde, connecting Agricola's line forts. But after a vain struggle of 60 years, the Romans found it necessary to abandon the whole district between the walls, and Septimius Severus repaired the wall of Hadrian, which thus became erroneously called the wall of S. Toward the close of the 4th c. Theodosius, for a brief period, reasserted the Roman dominion over the district between the walls of Antonine and Severus, which, in honor of the emperor Valens, obtained the name of Valentinian. But this newly-established province was soon lost, and it was not long before the Romans finally abandoned Britain. Many remains of the Roman walls are yet to be traced. See Bruce's *Roman Wall*, 3d ed. 1885.

SEVIER', a co. in s.w. Arkansas, having the territorial line of the Indian territory for its w. boundary, 547 sq. m.; pop. '90, 10,072, chiefly of American birth, incl. colored. The Little river forms its s. boundary, and it is drained by that river and its branches, one of which is its e. border. Its surface is diversified, a large proportion covered with hickory, oak, pine, and osage orange. Its soil is fertile; producing cotton, maize, sweet-potatoes, tobacco, etc. Its mineral products are lead, limestone, and slate. Co. seat, Lockesburg.

SEVIER', a co. in e. Tennessee, having the Great Smoky or Unaka mountains for its s. boundary, separating it from North Carolina; 560 sq. m.; pop. '90, 18,761, chiefly of American birth, with colored. It is drained by the French Broad and Little Pigeon rivers in the n., the former dividing a ridge of mountains. The central portion sinks into valleys and bottom lands of great beauty and fertility. In the hills are ledges of limestone and beds of iron ore. The surface is well timbered with oak, pine, and sugar-maple. The soil produces wheat, corn, oats, tobacco, maple sugar, and sorghum. Large numbers of cattle are raised. Co. seat, Sevierville.

SEVIER', a central co. in Utah, bounded on the w. by the Wahsatch mountains; drained by the Sevier river and Salt, Otter, and Curtis creeks; pop. '90, 6199, chiefly of American birth. The surface is table land or plain. The soil is arid. Area, 1872 sq. m. Co. seat, Richfield.

SEVIER, JOHN, 1745-1815; b. Va., explored the Holston river, in Tennessee, in 1769; built fort Watauga and defended it. He participated in Dunmore's expedition with the rank of capt., and fought in the battle of Point Pleasant. In 1772 he was delegate to a convention at Halifax, N. C.; member of the assembly, 1777; lieutenant-col. in the same year, and in 1779 gained a victory at Boyd's creek, and was a leader at King's mountain, 1780, receiving, in recognition of his services, a sword and the thanks of the legislature of North Carolina. He took part in the battle of Musgrove's mills, and in 1781 fought under Marion, and was made brig.-gen. In 1794 governor of Ten-

nessee, then called Franklin. In 1786 he went to war with the Cherokees; governor of the newly organized state of Tennessee, 1788-1801 and 1803-9; member of congress, 1811-15. He died on a mission to the Creek Indians.

SEVIER, LAKE, a considerable body of salt water in Millard co., s.w. Utah, at an elevation of 4600 ft. above the level of the sea; 188 sq.m.; 20 m. in length from n. to s., 10 m. wide. Its position is 120 m. s.w. of Great Salt lake, with no outlet; it is destitute of islands; its shores have no trees and few bushes. The Sevier river, its only tributary, empties into the n. portion. It is in Pauvan valley, a part of the Sevier desert. It is open only on the n. side, the House range of mountains guarding the w. border, and the Beaver creek range the eastern. Gulls and other birds which feed on fish, frequent the mouth of the river, seeking fresh-water fish which have come down through the river, and have died from the effect of the brine. Shrimps and insect larvæ are found in the water. In 1872 the brine was found, on being analyzed, to contain 62.3 parts in 1000 of chloride of sodium, 13.4 of sulphate of soda, 10.3 of chloride of magnesium, and 0.4 of sulphate of lime. The action of the atmosphere determines its extent; in dry weather its beaches recede; moisture in the air has the contrary effect. The water once occupied most of the Sevier desert, discharging into Salt lake, the channel being still visible 50 m. n. of the present boundary between the Sevier and Salt lake deserts. The track of the current is called the Old River bed, where the springs occur only in intervals of 50 miles. There was a time when the waters of Great Salt and Sevier lakes united in one large lake called Bonneville, with outlets through Snake and Columbia rivers. The shore lines are defined by fresh-water shells, showing that it covered Great Salt lake, Sevier, and Escalante deserts, and overflowed into the valleys of Utah, Juab, Rush, Skull, Preuss, Snake, and Cedar. Its former level was 575 ft. above the level of Sevier lake in 1872, and 968 ft. above Great Salt lake in 1873, and it was 125 m. wide.

SEVIGNÉ, MARIE DE RABUTIN-CHANTAL, Marquise de, was b. at Paris, Feb. 6, 1626. She was the only daughter of the baron de Chantal, Celse-Benigne de Rabutin, and his wife, Marie de Coulange. She was left early an orphan; and at the age of six the care of her education devolved on her maternal uncle, the abbé de Coulange, an excellent and amiable man, who most conscientiously acquitted himself of his charge, and for whom through life his niece entertained the tenderest affection. She was carefully instructed in all the knowledge which then appertained to the education of a French gentlewoman; by the eminent scholar Menage she was taught Latin, Italian, and Spanish; and M. Chapelain, another literary notability of the time, also assisted in her culture. At the age of 18 (Aug. 1, 1644), she was married to the marquis Henri de Sévigné, the representative of an ancient house in Brittany. The union was not a happy one. The marquis was "a man of wit and pleasure," of the type of the period; his wit he exhibited by his happy way of squandering his wife's fortune, and he took his pleasure in neglect of her, and addiction to other women. After a time, he was killed in a duel (Feb. 5, 1651), by a certain chevalier d'Albret, his rival in a love-affair. Left with a son and daughter, Sévigné now for a few years retired almost wholly from society, and devoted herself to their education. In 1654 she returned to Paris, where her beauty, her wit, her happy social tact and vivacity, concurred, with the charm of her sweet and kindly nature, to insure her unrivaled success in the brilliant society of the period. Her lovers were legion, and among them were numbered some of the most distinguished men of whom France could then boast, as the prince de Conti, Turenne, Fouquet the superintendent of finance, and others. But they sighed in vain: all offers of marriage she steadily declined; and from any of those lighter ties, there and then most leniently looked on—if not almost considered *comme il faut*—she has left no spot upon her reputation. For her virtue she must have credit as virtue, and not merely the coldness which simulates it; for she was obviously of a warm, eager, even somewhat impulsive nature. Her numerous and warm friendships, with her absolute devotion to her children, may have sufficed as food of a heart not unlikely, in lack of these, to have craved a more perilous diet. Her affection for her daughter in particular, who in 1669 became Madame de Grignan, was the ruling passion of her life; and to the separation of the mother, over long periods, from "this infinitely dear child," the world is indebted for by much the larger moiety of the collection of letters which has given fame in perpetuity to Madame de Sévigné. Madame de Grignan was one of the most beautiful and accomplished women of her time, and every way worthy of the love thus lavished without stint upon her. If she did not reciprocate its full fervor, *that*, as the shrewd mother well knew, was simply in the nature of the case; and not to have demonstrated in return more rapture than she really felt, ought to count as a point in her favor, rather than reverse-wise as it has been held to do. If it was the one main grief of Madame de Sévigné to be forced to live apart from her daughter, the happiness of dying beside her may perhaps have a little consoled her for it. In 1696, while on a visit to the château de Grignan, she was seized with malignant small-pox, and died at the age of 70.

The letters of Madame de Sévigné, on which her fame securely rests, are charming in the *abandon* and easy *naïve* frankness with which they reveal her beautiful nature. They sparkle with French *esprit* and spontaneous gaiety of heart; and their writer is scarce anywhere quite equaled in the delicate *finesse* with which, in a few careless rapid words, she flings off a scrap of light narrative, dashes in a little graceful picture, or

points a dramatic situation. Above all remarkable is the lightly-moved and ever-active sympathy which keeps her exquisitely *en rapport* with the interest of whatever may be passing before her. The best edition of the letters is that of Monmerqué and others, 14 vols. (1865-67). See the studies by Boissier (1887), and Mason's *Women of the French Salons* (1891).

SEVILLE, a province of Spain, included under the division of Andalusia; bordering on the Atlantic to the s. and s.w.; bounded n. by Estremadura, and w. by Portugal; 5295 sq. m.; pop. '87, 544,815. The greater part of the surface is a plain, through which the Guadalquivir river flows. In the n. are the Morena mountains; the s. is hilly. Most of the land is highly fertile; cotton, tobacco, olives, grapes, wheat, and maize are raised in large quantities. There is considerable cattle raising, and there are mines of silver, coal, iron, lead, and copper. The province was once occupied by the Moors, and their ruined walls and castles are still to be seen. Besides the capital Seville, Carmona and Ecija are the chief towns.

SEVILLE (Span. *Sevilla*, the *Hispalis* of the Romans), a famous city of Spain, formerly capital of the ancient kingdom, and now of the modern province of the same name, stands on the left bank of the Guadalquivir, 356 m. by railway s.w. of Madrid. The city is almost circular in shape, is surrounded by Moorish walls, surmounted with 66 (formerly 166) towers, and pierced with 15 gates, and is 5 m., or, including its 10 suburbs, 10 m. in circumference. Held by the Moors for five centuries, and entirely rebuilt by them from the materials of former Roman edifices, Seville was long a purely Moorish city, and the old Moorish houses, which age, in this dry climate, has done little to destroy, are still the best houses to be seen. The narrow tortuous streets that kept out the sun, with their wide spacious mansions, with ample courts and gardens, so perfectly suited to the climate, are giving way to spacious straight streets of small, hot houses, open to the blaze of noon. The cathedral, one of the largest and finest in Spain, is an imposing edifice, of which the solemn and grandiose are the distinctive qualities. It was completed in 1519, is 431 ft. long, 315 ft. wide, and the nave is 150 ft. high. The pavement is in black and white checkered marble. The cathedral is superbly decorated. Its painted windows are among the finest in Spain, and it contains paintings by Murillo, Vargas, the Herreras, etc. Attached to the cathedral is one of the most remarkable towers in the world. It is called the Giralda (i.e., a weathercock in the form of a statue), and is in all 350 ft. high. This Moorish tower was built in 1196, and was originally only 250 ft. high, the additional 100 ft. being the rich filigree belfry added in 1568. The pinnacle is crowned by a female figure in bronze, 14 ft. high, and 2800 lbs. in weight, and which veers about with the slightest breeze. From this great tower the *mueddin* (q.v.) of Mohammedan days called the faithful to prayers. The royal residence, the Alcazar (*Al-Kasr*, house of Cæsar), contains several noble halls, and much delicate ornamentation, that rivals that of the Alhambra. The Torre del Oro, or tower of gold, is of octagonal shape and Moorish design. The house in which Murillo lived and died is still to be seen here. The finest pictures in Seville are to be seen in the cathedral, the Caridad, the Museo, and the university. Besides the university there are industrial, normal, and many other schools. The city contains upward of 100 squares. The Fabrica de Tabacos, where tobacco is made into snuff and cigars, employs several thousand hands, mostly females. The Plaza de Toros can accommodate upward of 12,000 spectators. Water is supplied from a number of aqueducts, one of which was built by Julius Cæsar and rebuilt by the Moors. It rests on 410 arches. There are here several royal foundries and factories for arms, and porcelain and iron and machine works. Weaving, soap-making, and the manufacture of saltpeter, powder, leather, soap, cotton, thread, etc., is carried on. Pop. '87, 143,182.

The Hispal of the Phenicians, the Hispalis of the Romans, was corrupted by the Moors into Ishbilliah, of which it is supposed the modern name is a modification. It was a place of great importance in the later period of Roman dominion; became the capital of southern Spain during the ascendancy of the Vandals and the Goths, when it was the scene of two notable church councils (590 A.D. and 619 A.D.); and fell into the hands of the Moors in the 8th c., under whom it rapidly rose to a splendid prosperity, and reckoned 400,000 inhabitants. In 1026 it became the capital of the Moorish kingdom ruled by the Abadides, from whom it passed, in 1091, to the Almoravides, and in 1147 to the Almohades. In 1248 it was taken by Ferdinand III. of Castile, when 300,000 Moors left for Grenada and Africa; and from this time to the removal of the court to Valladolid, in the reign of Charles V., Seville was the capital of Spain. The city rose to its climax of prosperity after the discovery of the new world, when it became the residence of princely merchants, and the mart of the colonies, but its trade was afterward transferred to Cadiz. In 1810 it was taken and ravaged by Soult.

SÈVRES, a small t. of France, in the dep. of Seine-et-Oise, 6 m. s.w. of Paris, on the Paris and Versailles railway. It is celebrated for its manufacture of porcelain wares, which are unsurpassed for elegance of design and beauty of painting. Painted glass is also manufactured. The porcelain museum, which was destroyed during the war of 1870, contained a large and curious collection of articles in china and earthenware from all parts of the globe. There are also manufactures of sweetmeats, crystals, carriages, and bleaches. Pop. '91, 6902.

SÈVRES, DEUX, an inland dep. in the w. of France, between the deps. of Vienne on the e. and Vendée on the w. Area, 2,317 sq. m.; pop. '96, 346,694. The dep. takes its name from two rivers of the same name, the Sèvre-Niortaise, which flows w. into the

sea and the Sèvre-Nantaise, an affluent of the Loire. It is traversed from s.e. to n.w. by a chain of hills, called in the s.e. the *Monts du Poitou*, and in the n., the *Plateau de Gatine*. This ridge forms the water-shed between the Loire on the n. and the Charente on the south. The climate is generally healthy, and the soil is very fertile. There are numerous coal and iron mines, and good quarries of freestone and marble. The cereals, the vine, sugarbeet, flax, and various fruits are raised. The *arrondissements* are Niort, Bressuire, Molle, and Parthenay. Niort is the capital.

SEWAGE. It is of the first importance to health for houses, both in the town and in the country, that all filth should be removed from them as speedily as possible, and disposed of in such a manner as to cease to be injurious to mankind. It may be taken as a pretty safe general guide, that all matters which give off a disagreeable smell are dangerous if allowed to remain near our dwellings; nature thus giving us warning of the presence of something that may do us harm. Many people have thought that if, by using certain deodorizing materials, they could either fix this effluvium permanently or for a time, they had surmounted the difficulty; but this is scarcely half a cure, and a palliative like this is much less advisable than a radical measure of removing the filth by suspension in water, and rendering of it not only innocuous, but beneficial, by incorporating it with the great deodorizer—living vegetation. It seems as if nature had planned all this for us, if we will only follow her teaching. During the first two or three days after sewage is deposited in water, the smell is unpleasant, but not dangerous to mankind; after that, putrefaction begins, and the gases given off become deleterious. Here, then, is time for removal, and a punishment for neglect. Fevers, gangrene, ophthalmia, and many other diseases, especially among children, are certain to break out and become malignant if the emanations from such filth exist in the air around human habitations. Until within the last 50 years, privy-pits and cesspools prevailed everywhere. In the country the former were generally placed in the garden attached to the house, and at some distance off, so that there was not much danger attached to them. In the towns cesspools existed among the houses, but they were very objectionable and dangerous, and constantly neglected. These cesspools were large underground tanks built in brickwork, into which all the sewage from the house was discharged. In them the filth accumulated and putrified until it was periodically removed by manual labor. They acted like an immense brewing vessel sending up deadly vapors which had no escape, except back into the house among the inhabitants. The cesspools also frequently leaked, and so if any wells were near poisoned the water. When Bramah invented the water-closet, and a larger supply of water had to be found for towns, the cesspools began to overflow at such a rate that a general revision of the whole system became necessary, and at the same time medical men insisted upon the continuous and perfect removal of filth as the only reliable sanitary process of dealing with the matter. A return to the use of cesspools in any form would therefore be a step in the wrong direction, and would lead to disastrous results.

We may divide the subject as follows: 1. The management of the sewage of cottages; 2. Dwelling-houses and public buildings in the country; 3. Towns; and 4. The utilization of sewage.

1. *Cottages.*—It is obvious that in the case of single detached cottages expensive arrangements such as those necessary for water-closets could not be provided, and some simpler plan must be followed.

It is very objectionable to allow either cesspool or privy-pit, if they can be avoided, as they are constantly neglected, and overflow into some stream, or poison the wells and the air. The privy should be placed, wherever that can be managed, on the n. or e. side, and to the rear of the house, so as not to be between the people and the sun and softest winds. The whole sewage-matter should be received in a square galvanized iron pail underneath a seat, which pail can be removed from the outside, and into which a small quantity of house-ashes should be placed, either daily, or as often as the closet is used. This will quite fix the ammonia. The iron pail must be removed by the cottagers at least once a week, and emptied into their garden. No danger can possibly arise from this, if strictly followed, and all the sewage-matter is placed to its best purpose. There has not been found any difficulty in introducing this system among cottagers.

2. *Dwelling-houses and Public Buildings in the Country.*—It would be useless to discuss a dry-earth system like what has been mentioned anywhere but for outhouses attached to cottages; the general feelings of the inhabitants would not tolerate it. We must therefore accept the water-closet as the system universally adopted. In planning the position of water-closets for a house, the first thing to be thought of is, that they shall be if possible on the n. or cool side of the house, and upon exterior walls. If they are placed in the interior of the house, it is troublesome to get at the drains when required, and the closets themselves cannot be sufficiently ventilated. If the closet is inside the house, then Bramah's patent with a D trap underneath is the only form that should be used; but if the closet is outside, then a less expensive one with a syphon earthenware trap may be adopted. It is desirable that the closet should be surrounded with brick walls, and, in fact, isolated from all other parts of the house. The window of the closet when inside the house should always reach the ceiling; and a ventilating

shaft is desirable where the closet is much used, and the window must be shut occasionally. The ordinary water that passes into the drains leading from any closet—such as is discharged each time that the handle is raised—is not sufficient to sweep out thoroughly all the solid matter from the drain-pipes, and therefore a flushing apparatus at the highest point of all sets of drains is essential, so that a body of water may be allowed to pass down with a rush at least twice or three times a week. It is also desirable that the foul air engendered in the drain-pipes themselves should have some free outlet into the air at some point where it will not be injurious. The gas given off under such circumstances is of a very light character, and has a great tendency to ascend and draw toward heat. During the greater part of the year, especially since the system has been introduced of heating houses by hot air, the temperature of living-rooms is much higher than the atmosphere outside; a pumping action is exercised upon the drains, or indeed upon any outlet, for a fresh supply. If, therefore, some safety-valve is not provided, the gas will force an entry through the traps or some imperfection in the joints of the drains. In constructing the drains from houses or large public buildings, it is now a well-decided point that there should be an entirely separate system for the sewage or foul water, apart from that for rain and surface-water. The reasons are many and obvious, but they are given more appropriately under the head of the drainage of towns. Stone-ware pipes are the best material to be used for drains, because they are perfectly non-absorbent; but in many cases glazed earthenware will answer very well. The smallest size of pipes of any description that should be used for removing sewage from a house is 6 in. in diameter. This size, then, may be gradually increased as is necessary, and one of 9 in. will remove the sewage of 500 people. The best fall to be given to a sewage-drain is 1 in. in 10 ft.; but all will work well from 1 in. in 5 ft. up to 1 in. in 60—provided the flushing arrangements are as they ought to be. In order to keep the drains clean, not less than 10 gal. of water daily should pass down the drain for every person in the house; while anything over 25 gal. is superfluous. At every 20 yards there should be a pipe laid from which the upper half can be removed, and the interior inspected at any time, and any stoppage remedied without the necessity of breaking the pipes. Greasy water, such as is poured down from the kitchen and scullery of a house, is one of the constant causes of such stoppages. The fat, as it cools, congeals on the sides of the pipes, and forms a hard cake. The best method of preventing this is to form a small cesspool, into which the kitchen water is poured first, and then to take an overflow through a syphon into the foul drain, so that the liquid only enters, while the fat can be removed by hand from the cesspool. The sewage-matter having been thus all thoroughly removed from the house, a sewage-filter should be built. The solid and liquid matters of the sewage are here mechanically separated, and the former can be removed from time to time—say once in six weeks or two months—while the latter must be passed on for irrigation. It is clearly illegal to pass it into any stream; and it is apt to become a serious nuisance if anything else is done with it. We shall treat of the best method of utilizing this liquid under the fourth head. It is always advisable to get space for all these arrangements on the n. and e. side of a house, when possible, so as to run no risk of contaminating the air on the s. or hot side of a dwelling; and if a belt of trees can be placed between the sewage-filter and the irrigated land and the house, it will also be advantageous.

3. *The Drainage of Towns.*—Until within the last 40 years, the only drainage which existed in towns was for the rain-water and surface-water alone, and the inhabitants were strictly watched to prevent their passing any sewage matter into these drains. The introduction of the water-closet, however, gradually increased the water which overflowed from the old cesspools to such an extent that it was impossible to prevent overflows of this description, and systems of drainage were designed to carry off the whole, both sewage and rain-water. A very composite system of drainage then arose. Generally, the bed of some stream or natural rivulet passing through the town was covered over, and the whole filth passed into that along with the rain-fall of the district. This soon was found unsatisfactory, because the flood-waters of the stream were not to be relied on to keep the channel clean, and so the filth remained festering underneath the ground, giving off deadly gases in the midst of the population. The next arrangement which succeeded to that system was to plan large drains for the rain and surface-water and sewage, and still keeping the idea of the size of the bed of a natural stream before them, engineers thought it necessary to make all the main drains large enough for a man to pass through them, and keep them clean. Seeing the vast quantity of sand and grit that was occasionally washed off the streets, something might be said in defense of this system. Vast numbers of these great main sewers still exist. Into these sewers all the smaller house-drains were to enter, and the surface-water through street-gratings as well. The ordinary water used for domestic purposes, and the occasional rain-falls, were relied upon to flush those large main sewers; but their great size made this an exceedingly difficult and uncertain process, and they, in fact, became only cesspools elongated. In dry weather, the filth was retained in them to such an extent, that after heavy rains, chemical analysis showed that the water that was discharged contained frequently twenty times the amount of human fecal matter per gallon more than it did in dry weather. This state of matters, added to the fact that long-continued dry weather was

always attended by an increase of deaths from typhus and other fevers, clearly showed that something more must be done. A further step was then taken by sanitary engineers. The idea of men passing up the drains was set aside, and the smallest possible drains were constructed, until these have arrived at such dimensions as an 18 in. main drain for a town of 10,000 inhabitants. The rain-fall was still to be relied on to a certain extent for flushing purposes, but a supplementary assistance was to be given at some points by flushing with water from the ordinary regular supply of the town. As these smaller drains were not sufficient to carry off all the surface and rain-water, as well as the sewage, overflow weirs have been provided at certain points, where the excess must go over, and pass away into some other channel. This is the system now most generally adopted, and is better than its predecessors; but it is now decided that it, in its turn, must give way to something better, and the change has commenced. The necessity of dealing with the sewage at the main outfall, and the utilization of it for agricultural fertilization, while, in nine cases out of ten, pumping must be employed to lift the sewage of a town at the discharging point for such a purpose, have gradually forced upon us the conviction that the sewage and household water must be kept quite distinct from the surface-water, subsoil water, and rain-fall.

The outfall of the sewage drain, and subsequent disposal of the filth, are in reality the first things to be considered. Hitherto, engineers in general have taken the nearest stream, and polluted it to such an extent, that perpetual law-suits, nuisances, and diseases have been the result. Fever of the worst class is certain to follow the drinking of water tainted in this manner, and there is scarcely a stream in the interior of the country which has not been injured more or less from this cause.

Again, where the sewage has been emptied into the sea, tide-locked drains are objectionable, and the sewage, when mixed with salt water, generally gives off more stench than ever. We may briefly say that all attempts at deodorization by chemical processes have hitherto failed, and as far as our present knowledge goes, are not to be relied upon. The utilization of the sewage on the fields by irrigation is, therefore, the true solution of the problem, and we must arrive at the simplest, cheapest, most certain, and most perfect system of accomplishing this. When sewage and rain-fall all go together in the same drains, as they do in all the older systems, all is uncertainty; while when the two are separated, rain and surface-water can be discharged at any point into the natural water-courses of the country, and a fixed quantity of sewage, with household and flushing water, would be passed to the main outlet, to be there dealt with. The opponents of this system say that it is too expensive and troublesome to plan; that it is unnecessary, as it is sufficient if engineers provide for the dry-weather flow of the sewage, and use that for irrigation; and that when the overflows come into action in floods, the whole is so much diluted, that no harm is done to any one. The advocates of this double system of drainage have proved that the total separation of the two is the most sanitary system, because the street-gratings and rain-water pipes, which at present let down the rain-water into the sewage drains, act, in fact, as so many ventilating shafts, and discharge the stench in the midst of the inhabitants; while, under a separate system, the sewage-pipe would be entirely sealed up, and only ventilated at such places as could safely be done; that the rain-water as a flushing power ought to be entirely discarded, as it fails in dry weather, just when it is most wanted; that in wet weather, and winter again, when the discharging of the sewage on to the surface of land is carried out, the great quantity of water sent down through the drains by the present system is agriculturally a serious injury; that when pumping has to be employed for lifting the liquid for irrigation, as it is in most cases, all is uncertainty, and that no machinery can be economical and efficient under such circumstances, and that the planning of the irrigation also becomes difficult to manage, and irregular. With regard to the expense, it has been proved that, as the rain-water and surface-water can be discharged at the nearest point, all the drains may be much lessened in size; and further, that the flushing power of the water in the sewage-drains will be much more efficient, while the corresponding lessening of the expense in carrying out the process of utilization will completely compensate any additional outlay that may be incurred in laying the drains in towns. If we take the case, which is a common one, of a pop. of 10,000 people living upon a sq. m., the first-mentioned system, where rain and sewage-water go together, would require pumping machinery, in dry weather, of, say, five horse-power, to lift the liquid; and it would further be necessary, for wet weather, to have in reserve a lifting power of 150 horses; while, on the separate system, where the sewage alone would have to be dealt with, the five horse-power engine would be regularly and constantly employed, and its work would be almost entirely confined to the daytime, whereas the other must be ready at any time, and for every emergency. The system of sending sewage and rain-water together has been hitherto adopted in all towns; but except in one or two cases where gravitation has been available to utilize the discharge from the drainage, all engineers have failed to prevent the pollution of rivers, and it is obvious that something else must be tried, as that cannot be permitted to go on much longer. The system of separating the sewage and rain-water has been carried out in several large asylums and public buildings, many barracks, the town of Eton, and Windsor castle—where every consideration, both of expense and sanitary influence, was brought to bear on the subject. Reading, Oxford, and several other towns are fast

following on the same principles, and the results are hitherto most satisfactory. Great economy has resulted from the process.

4. *The Utilization of Sewage.*—The whole of the sewage of a house or town having been conveyed away in the manner we have described, the next important step is to know what to do with it. Above all things, it is desirable to add to the productiveness of the soil, so as to compensate in some degree for the constant supply we are drawing from that source.

The liquid nature of sewage, adopting as we may the ordinary amount of dilution in dry weather at the rate of 25 gals. per head, has been a great obstacle in the way; while also the vast quantities of road-grit, and the great glut of rain that come down along with the sewage when there is only one system of drains in a town, have upset all arrangements and calculations. Many attempts have been made, especially at Leicester, some years ago, to precipitate all the valuable qualities of the sewage by impregnating the whole with milk of lime; but the process was unremunerative to those who did it, as so much sand was precipitated at the same time, that the product obtained was almost worthless as a manure; while, as the greater part of the ammonia escaped in the water, the discharging of it into any stream was still, strictly speaking, quite illegal. As far as chemical knowledge can guide us, there seems at present to be no hope in this direction.

At Edinburgh, again, and at Croydon, the irrigation of land by gravitation has rendered the process a simple one, because the whole has been poured over the land with many excellent results. These, however, are clearly exceptional cases, and we must look to pumping as being necessary in by far the greater proportion of towns; while for the two places we have mentioned, the results would, in all probability, have been better still if the strength of the sewage had been more concentrated. Agriculturally speaking, any dilution above 25 gals. per head of the population is not desirable, but is injurious and expensive to distribute; while, again, human faecal matter is too strong to be applied to land unless diluted in something like 10 gals. of water. The Chinese teach us an important lesson in this respect. They place all the solid matter, when they remove it from the towns, in small wells in their fields, and then take a scoopful and mix it in about ten or twelve times its volume of water before they apply it to their crops. If any one attempts utilizing sewage when mixed with rain-water, and has to pump the whole all the year through, he will find himself in endless difficulties.

Presuming, then, that we can arrive at a fixed quantity of 20 gals. per head of the population, or what may be taken as the dry-weather flow of the drainage from a town, the first step is to pass the whole through a strainer, so that all materials may be intercepted which will be likely to interfere with the pumping, or choke the smaller pipes used for irrigation. This is necessary, also, because in its unstrained state we cannot depend upon sewage going down and up again, and so passing over a valley, and the sphere of operations then becomes more limited.

Great part of the solid matter can also be removed by this process, and common house-ashes are the best mixing and deodorizing material to facilitate the stuff being carried away.

A piece of land should then be sought out, with a slope, if possible, of 1 ft. in 30 at least, and the filtered liquid, which will be full of strength, conveyed either by pumping or gravitation to the highest point of that land. Iron pipes should not be used, if possible; and when the land is very flat, it must be ridged and leveled. From the highest point of the land selected, the liquid must be conducted by open channels or through common drain-pipes laid on to the surface to all the different points where it is wished, and utilized for irrigation. The land adopted should be moderately porous, and then for every 100 people an acre may be allowed, but this varies much according to the nature of the soil. The land must be thoroughly drained and prepared. The best crops to be grown are Italian rye-grass, with alternately crops of vegetables, such as potatoes, cabbages, rhubarb, mangold. All these will luxuriate on the liquid, and we think we may safely say that the command of such liquid would be worth to any person from £5 to £10 an imperial acre, according to local circumstances.

Milch cows thrive remarkably well on this grass, and it has been proved by chemical analysis that the milk is of the best quality, while the vegetables are also quite wholesome.

Could such a system be carried out in the neighborhood of all our large towns, the results would be highly beneficial. The difficulties in the way, principally arising from ignorance on the subject, have been great; but to this system, or something like it, there can be no doubt, before many years, we must come, to prevent pollution of the rivers, and to make the most of the sources of fertility which are at our command, but which we are at present recklessly wasting. Many committees have been appointed by the house of commons to inquire and take evidence on this subject. In 1857 a commission was issued by the crown to certain gentlemen, at the head of whom was lord Essex, to inquire into "the best mode of distributing the sewage of towns, and applying it to beneficial and profitable uses." This commission went to work principally at Rugby, and made a vast number of experiments, the general result of which may be stated to be, that ordinarily diluted sewage may be said to produce such increased crops as to warrant an agriculturist in giving one halfpenny a ton for it, a ton of water containing 224 gallons.

The third report was issued in April, 1865, and the following recommendations are given as the results of their labors:

"1. The right way to dispose of town-sewage is to apply it continuously to land, and it is only by such application that the pollution of rivers can be avoided.

"2. The financial results of a continuous application of sewage to land differ under different local circumstances; first, because in some places irrigation can be effected by gravity, while in other places more or less pumping must be employed; secondly, because heavy soils (which in given localities may alone be available for the purpose) are less fit than light soils for continuous irrigation by sewage.

"3. Where local circumstances are favorable, and undue expenditure is avoided, towns may derive profit, more or less considerable, from applying their sewage in agriculture. Under opposite circumstances, there may not be a balance of profit; but even in such cases a rate in aid, required to cover any loss, needs not be of large amount. Finally, on the basis of the above conclusions, we further beg leave to express to your lordships that, in our judgment, the following two principles are established for legislative application: First, that wherever rivers are polluted by a discharge of town-sewage into them, the towns may reasonably be required to desist from causing that public nuisance. Second, that where town-populations are injured or endangered in health by a retention of cesspool-matter among them, the towns may reasonably be required to provide a system of sewers for its removal; and should the law as it stands be found insufficient to enable towns to take land for sewage-application, it would, in our opinion, be expedient that the legislature should give them powers for that purpose."

It is obvious, however, to any one perusing the above paragraphs, that they are exceedingly vague, and form but little guide to any one who must go into the question of whether money invested in utilization of sewage-schemes will pay an adequate return upon the outlay. The uncertainty attending the dilution of the sewage; the necessity of making the earth take it at all seasons; the distance that the liquid has to be pumped—have all been such difficulties in the way, that the commission could not well arrive at any other result than they have done.

Experience has now proved, what was formerly a matter of presumption, that, until we arrive at fixed quantities, no reliable principles can be laid down that would in all cases enable us to overcome the difficulties attending the sanitary management and utilization of sewage. See SANITARY SCIENCE.

SEWAGE, LIERNUR SYSTEM OF. The pneumatic system of Capt. Liernur for dealing with the sewage of a town has been in operation for some years on the continent; and Amsterdam, Leyden, Prague, Dordrecht, St. Petersburg, and some other towns, are now either partly or wholly drained on this plan. A town so drained is divided into districts of from 250 to 1000 acres, according to circumstances. Each of these districts is again divided into small sewage areas varying from 10 to 50 acres, also according to local circumstances. These small areas have each an air-tight cast-iron tank, from which extend along the several streets air-tight pipes of the same material, 5 in. in diameter, and independent of each other. The closets of the houses are connected by branches with these pipes.

An air-pump engine, or more usually two or three of these steam-engines, are placed in some central station, and in the under portion of the building air-tight iron reservoirs are situated, in which a vacuum of about $\frac{1}{4}$ atmospheric pressure is maintained. Pipes, also air-tight, and called central pipes, connect these reservoirs with the street tanks. Like the outer series, these are 5 in. in diameter, and each pipe has two connections with its street tank, by one of which only air can be sucked out; but the other dips into the well of the tank, thus enabling its contents to be removed by suction to one of the central reservoirs. When a vacuum is made in one of the street tanks, the contents of the closet pipes are drawn toward it; and on a second vacuum being created, the charge is drawn into it. This tank is then in due time emptied into a central reservoir by exhausting the air in the pipe connecting them.

We may state here that, although no water is used for flushing it is found that the fecal matter is reduced almost from the first to the consistency of thin pulp by the atmospheric pressure. Now as it is impossible to propel liquid any great distance along a horizontal tube simply by air-pressure—the air column always breaking through and destroying the vacuum—the pipes require to be set at inclines varying from 1 in 5 to 1 in 250 according to circumstances. This admits of a series of vertical risers being formed from which the liquid matter can never be altogether removed, and therefore these form a complete lock-off of one gradient from another, so that the vacuum cannot be destroyed. The residual liquid in these risers corresponds to the left quantity of water which a pump can never completely remove from a receptacle. When the apparatus is at rest, this minimum quantity of liquid matter arranges itself partly in the riser and partly in the lower end of the sloping pipe.

To show what takes place when there is a much larger amount of excreta to remove in one direction than in another, we may take the case of two branches from one main pipe each 100 ft. long, the gradient 1 in 100, and each having a riser of 1 foot. One of these pipes may have to deal with a single house producing only 1 ft. of fecal matter; the other may be connected with a barrack producing 100 times as much. "We have,

therefore, in the barrack pipe a mass filling both pipe and riser, and ready on the slightest force to discharge into the main or street pipe. On the other hand, in the branch pipe of the single family, there is the minimum quantity collected at the foot of the riser. The sucking action is now put in operation in the main pipe. The pressure of the atmosphere begins to act, and the barrack pipe rapidly discharges into the main pipe, while the smaller quantity is simply climbing up the riser, and before it has got to the top of the riser to be in a position to discharge, all the surplus quantity in the barrack pipe is gone, and that which is left is simply equal to that minimum which cannot be withdrawn. In this way the fullest pipe always begins to discharge first, the next more full waiting for it, and so on, until the minimum is reached, when simply air breaks through."

During the day the air-pumps maintain a vacuum in the central reservoirs and throughout the whole extent of the central pipes connected with them. Patrols of two men each visit the district tanks, one of whom, by opening a valve, makes a tank communicate with the central pipes, and so exhausts the air from it. He then shuts the valve, and the second man immediately opens another which allows the vacuum to act on one of the street pipes and its branches. A second, third, and fourth street pipe is dealt with in the same manner—the vacuum meanwhile being frequently renewed in the tank—till all the sewage in a district is collected and transferred to a central reservoir.

The pneumatic system of Liernur admits of ordinary water-closets being used. As, however, the water has afterward to be got rid of, he prefers, on the score of economy, a form of closet devised by himself which is used without water. It has no movable mechanism at all. The space into which the excreta falls is one arm of a short bent tube or siphon trap discharging into a soil-pipe. Each new deposit by its own weight forces out the former one, and there are special arrangements for the ventilation of the closet.

Capt. Liernur aims at making the sale of the fecal manure cover the working expenses of the system. The process, or at least one process, by which he converts the sewage material into a marketable manure, is as follows, leaving out some of the minor arrangements for saving heat. Mixed with a little sulphuric acid, it is placed in a large boiler through which pipes pass, and through these pipes waste steam, after being superheated, circulates, by which a rapid boiling takes place. The material is afterward transferred to a trough in which a long hollow drum of thin metal, heated internally, revolves. The drum takes up and dries a thin layer of the manure, which is scraped off by a fixed knife and sold under the name of *poudrette*. It contains from 7 to 10 per cent of ammonia, and it is affirmed that this method of converting the liquid manure into a dry powder is highly remunerative.

We need hardly explain that wherever the Liernur system is adopted, the mere water drainage such as that required for rain, waste water of houses, and the like, is provided for by separate drains formed of earthenware pipes, but of much smaller size than in cases where all kinds of sewage pass through them. Existing sewers in a town may of course be used for this purpose.

The details of the Liernur system have been so recently brought to much perfection, that we shall probably have to wait for some years yet before any decided opinion can be formed of its merits as compared with other methods of treating sewage. As yet no sanitary engineer has adopted it in England even on a small scale, but if it succeeds on the continent no doubt any existing prejudice against it will soon be overcome.

SEWAGE EARTH-CLOSET. In addition to the arrangements noticed under SEWAGE, and under SEWAGE, Liernur's System of, for getting rid of excreta, there is partially in use an *earth-closet*, in which the powerful deodorizing and other properties of dry earth are taken advantage of to deprive refuse of offense or harm, and to retain it in a fit condition for agricultural use. There are numerous forms of this kind of closet. Perhaps the simplest kind is that which consists of nothing more than a seat and a pan, the latter being lined round with earth by the help of a movable central mold or core. More convenient forms consist of a pail or a square-shaped pan on wheels under the seat, and an earth-box rising above it at the back. The box may be made to hold as much earth as serves for twenty or thirty sittings. By one of several devices in use, a valve is opened at the bottom of the earth-box, which allows the proper quantity of earth to descend through a spout and cover the deposit. The mechanism of one kind is such that the seat descends with the person, thereby bringing a charge of earth to the bottom of the spout, and when he rises it is dropped upon the feces.

The earth-closet system is, of course, scarcely practicable in large towns, as it would be very difficult to plan an economical arrangement by which the large quantities of earth required could be carried to and fro. But it is in use in many villages, and in some large isolated buildings, such as jails and hospitals. It has been much adopted in India, where, owing to the warmth of the climate, the rendering of fecal matter innocuous from the first must give it a peculiar advantage. It also appears to have been tried on a considerable scale in America; and a competent authority there reports that "experience has taught that its power for usefulness is restricted by the difficulties involved in procuring, preparing, and removing the dry earth required in its use, and

to some extent by those which attend, mechanically and chemically, the application of the earth to the dejecta.

SEWALL, MAY (WRIGHT), an educator, born in Milwaukee, Wis.; was educated at northwestern university and married, in 1880, Theodore F. Sewall. She became chairman of the executive committee of the National Woman Suffrage Association; was one of the World's Fair managers for Indiana in Chicago, 1893; has lectured on education, etc., and edited *The Historical Résumé of the World's Congress of Representative Women*.

SEWALL, SAMUEL, 1652-1730; b. England; came with his father to America at the age of nine; graduated at Harvard in 1671; preached for a short time; obtained great wealth by his marriage in 1677; went in 1688 to England; returned in 1689; in 1692 appointed one of the council, holding the office till 1725; was a judge, 1692-1718, when he was made chief-justice. Sharing in the general belief in Europe and America concerning witchcraft, he concurred in the condemnations in 1692; but in 1697 made a humble public acknowledgment of his error. He contributed liberally for the spread of the gospel among the Indians. In 1699 he was chosen one of the commissioners of the society in England for the propagation of the gospel in New England, and was their secretary and treasurer. He was for many years a member of the Old South church and held in high esteem. He published *Answer to Queries respecting America; Accomplishment of Prophecies; A Description of the New Heavens*. His diary and other papers are in possession of the Mass. historical society.

SEWALL, SAMUEL, LL.D., 1757-1814; b. Boston; great-grandson of the chief-justice and grandson of Joseph, D.D.; graduated at Harvard college, 1776; studied law and for many years practised in Marblehead. In 1800 he became judge of the supreme court, and in 1813 was made chief-justice.

SEWARD, a co. in s. w. Kansas, having the territorial line of Oklahoma territory for its s. boundary; 648 sq. m.; pop. '90, 1503, chiefly of American birth. It consists of a level fertile plain destitute of timber. Co. seat, Liberal.

SEWARD, a co. in s. e. Nebraska, drained by the Big Blue river, and its n., middle, and s. forks, on the Fremont, Elkhorn, and Missouri Valley, and the Burlington route railroads; 576 sq. m.; pop. '90, 16,140, chiefly of American birth. The surface is rolling. The soil is productive. Corn, wheat, and oats are the staples. Co. seat, Seward.

SEWARD, FREDERICK W., son of Wm. H.; b. N. Y., 1830; graduated at Union college, 1849; admitted to the bar, 1851; associate editor of *Albany Evening Journal* until 1861; assistant secretary of state, U. S., 1861-69, and again under the administration of President Hayes.

SEWARD, WILLIAM HENRY, an American statesman, was born in Florida, N. Y., May 16, 1801. He entered Union College at the age of fifteen, and graduated in 1820, having also spent six months of his senior year teaching in Georgia. In 1822 he was admitted to the bar, and settled in Auburn, N. Y. He soon distinguished himself in his profession, and acquired a high reputation for originality of thought and independence of action. It was about this time also that he became much interested in political affairs, and his first public work was an address in which he briefly outlined the history of the so-called "Albany regency"—a political clique who were exerting a most injurious influence in state affairs at this time. Seward made such an *exposé* of their machinery and intrigues, that it led to their final overthrow, in 1828. In 1830 he was elected to the State Senate by the anti-Masons, who at that time were a powerful majority in western New York. He was probably the youngest man ever elected to the Senate, not being quite thirty, but he soon became the leader of his party in that body, taking a prominent part in all the debates, especially those relating to internal improvements and the common school system. In 1833 he made a rapid tour through many countries in Europe, and during his absence wrote a series of some eighty letters, which were published anonymously in the *Albany Evening Journal*, and which added much to his reputation when their authorship became known. In 1834 he was a candidate for governor, but was defeated. About this time he received the lucrative appointment of agent of the Holland Land Company, which gave him wealth and influence. In 1838 he was elected governor by a large majority, and his administration was in many ways one of the most remarkable of any in the history of the state. Education, internal improvements, public works, reforms in the courts, banking, and militia systems, the extension of the franchise, and many other equally important were subjects to which he gave close attention during his term of office, while his messages to the Legislature are regarded as models of their kind, remarkable alike for their exalted views and their comprehensive grasp of the topics of the day. In 1843, declining renomination, he resumed his law practice in Auburn. In 1847 he was invited to speak in New York on the life and character of Daniel O'Connell, and this was, perhaps, one of the most brilliant oratorical efforts of his life. In 1849 he was elected to the U. S. Senate, and at once took a prominent position as the recognized leader of the Administration party. In 1850 he delivered his famous speech on the admission of California as a state, in which he made use of the expression "there is a higher law than the Constitution," that has since acquired so wide a fame. Another of his felicitous phrases, which is frequently quoted as giving character to the history of his time, is

from a speech in Rochester in 1858, in which he declared that there was "an irrepressible conflict between opposing and enduring forces," and that "the U. S. must become either entirely slave or entirely free." Beside his speeches on the compromises, he delivered many others on the commercial and industrial relations of the country, all of which are noticeable for their practical character, the variety and accuracy of statistics used, and the fervent love of country shown. Indeed, it is said that his speeches on the Tariff, Duties on Railroad Iron, American Whale Fisheries, Mail Steamers, and Internal Improvements, particularly, the Pacific railroad, were among the most powerful arguments made in behalf of those measures during the session. Another of the measures which met with his entire approval and support was the gratuitous distribution of public lands, since embodied in the "Homestead Bill." "A home," said he, "is the first necessity of every family; it is indispensable to the education and qualification of citizens." He was re-elected to the Senate in 1855, and the news of his re-election was received with demonstrations of rejoicing throughout the free states. In 1859 he revisited Europe, and extended his tour to Egypt and Palestine. In 1860 he was the most conspicuous candidate of the Republican party for the presidential nomination, receiving one hundred and seventy-three votes on the first ballot. He was defeated, however, by Mr. Lincoln, and he soon afterward canvassed the west in behalf of Mr. Lincoln, everywhere commending him as the safest man in the Union to whom to confide the cause of freedom against slavery. Then came the election, and Seward was made secretary of state, a position that he filled for eight years with an almost unparalleled industry, energy, and success. During this period he negotiated nearly forty treaties, most of them of historic importance. Of these there were three each with Great Britain, Italy, Mexico, and Peru. Without doubt, his finest acts of statesmanship were his management of the Trent affair; his dignified and determined action at the time of the French invasion of Mexico; and the purchase of the territory of Alaska, an act of judgment and foresight not fully appreciated by the public for many years.

On the 14th of April, 1865, as the war approached its termination, and while Seward was confined to his room by a fall from his carriage, President Lincoln was assassinated by John Wilkes Booth, an actor at a theatre in Washington. At the same time another assassin named Paine penetrated to the room of Mr. Seward, dangerously wounded his son, and with a poniard inflicted wounds upon him which were at first believed to be fatal, but from which he slowly recovered.

In 1869 he made an extended tour of California and Alaska, and in 1870-71 he made a journey around the world, and was received everywhere with distinction. He died in Auburn, Oct. 10, 1872. His speeches and orations are published in four volumes. He also wrote a *Life of John Quincy Adams* and a *Life of De Witt Clinton*. See Baker, *Life of William H. Seward*; Welles, *Lincoln and Seward*; Frederic W. Seward, *William H. Seward*, and *William H. Seward's Travels Around the World*, by his adopted daughter, Olive Risley Seward.

SEWELL, WILLIAM J., b. Ireland, 1835. He emigrated to the U. S., 1851; entered business in New York; went to sea for some years; and re-entered business life in Chicago. At the outbreak of the civil war he became capt. of the 5th N. J. vols., and at the close was a brevet maj.-gen. He was a member of the N. J. state senate for nine years, its pres. three years; and was elected, as a repub., to the U. S. senate, 1881.

SEWELLEL, *Aplodontia leporina*, Rich., an animal of the size and general appearance of the musk-rat, having the peculiarity of rootless molar teeth. It has a reddish-brown color, small eyes, short tail, strong jaws, and a plump body. It inhabits the n.w. coast of North America, particularly the region of Puget's sound. The natives use the skin as an article of dress. The animal lives in families or herds and makes extensive burrows.

SEWING-MACHINE, one of the most important inventions of this century. Like the stocking-frame, which in principle it closely resembles, we owe it to the ingenuity of a poor mechanic, striving to lessen the labor which he saw was a real hardship upon his wife and other poor women. Elias Howe, a native of Massachusetts, surrounded by a young family, for whom he was obliged to labor during the day, devoted his after-hours to the construction of a sewing-machine. This was about the year 1841, and his career since that period up to the present time forms a striking chapter in the annals of intelligent labor, and furnishes another proof of the saying that "fact is stranger than fiction." After incessant labor, during the latter part of which he and his family were indebted to a friend for the means of subsistence, he completed the first working sewing-machine, the patent for which was granted to him in May, 1841. He did not succeed in inducing the people of his own country to see the value of his patent, and went to England, where, after patenting it there also, he met with so much discouragement that he sold the patent for £250 and a royalty of £3 per machine to a staymaker, Mr. Thomas of Cheapside, London, who used it successfully in his own business, but did so little toward making it public that for several years its existence was only known to a very few individual manufacturers. When Howe reached his own country again, he found his American patent pirated by a wealthy company; but with admirable spirit he asserted his rights, and succeeded in establishing them; and it is gratifying to know that his talent, industry, and perseverance were rewarded, and he became a wealthy man.

Howe's machine worked what is called the lock-stitch, but since his invention became known numerous improvements and modifications have been introduced by other inventors. The principal of these are as follows: 1. *Machines which sew with one thread*; of which one kind makes the *through-and-through* or *shoemaker's stitch*, the thread being held and pushed through with pincers, one pair on each side of the material to be sewn. The needle is pointed at each end, and being pushed through by the pincers on one side, is taken hold of by the corresponding pair on the other, and the thread is thus pulled through backwards and forwards. Only a small length of thread can be used by this machine, hence it is of but limited application. 2. Another single-thread machine makes the *running-stitch*. In this, the needle is stationary, and receives a continuous supply of thread from a reel; two small-toothed wheels are so arranged that their teeth, pressing into one another, crimp the two pieces of cloth, and push them forward against the point of the needle, which, as it gets filled, is relieved by the operator, who keeps drawing the sewn cloth off at the eye-end of the needle. This machine answers admirably in cases where loose tacking is required. It is the invention of an American of the name of Bostwick, who introduced it into England in 1844. 3. The *chain* or *tambour stitch* is also a single-thread stitch, the machine for which was invented by M. Thimmonier, a Frenchman, in 1848. In this, the thread is looped upon itself by means of a curved shuttle

after it has passed through the cloth. This kind of stitch, though very useful for some kinds of work, is easily pulled out. 4. Wheeler & Wilson's sewing-machine, another American invention, has acquired the greatest reputation in other countries. It is a double-thread machine, and besides the vertical eye-pointed needle, has a curved shuttle or hook (fig. 1, *a*) working below, with a revolving reel, *b*, inside its curve. The reel is of metal, each side being convex externally; and so adjusted on the axle, that the edges are so near together as to admit only one thickness of the thread to pass through (fig. 2). The side view of the whole

FIG. 3.

FIG. 1.

FIG. 2.

arrangement is seen in fig. 3. It fits easily within the nearly circular hook, and gives off its thread as required. The thread passes partly round the outer edge of the hook upon a slightly-grooved bevel (*a*, fig. 3), which forms a loop, and passes it between the needle and the thread which it carries with it in descending; the loop is held in position as the needle ascends, and the cloth being moved on, the next descent of the needle takes it through the loop and receives another below it, which renders the first one tightly locked. The lock stitch, the chain stitch, and the buttonhole stitch are the only stitches produced by machines. Among the prominent sewing-machines may be mentioned the Grover & Baker machine, the Singer machine, and the Wilcox & Gibbs machine. Sewing-machines have been patented in America and England by another American named Blake for sewing the soles on boots and shoes; and so rapid are they in their work, that it is said during the war in the United States as many as 150 pairs of soles have been sewed on army boots in one day by a single machine. Special sewing-machines are also in use for sewing the upper leathers of boots and shoes, for gloves, for embroidery, and various other purposes.

SEXAGESIMA SUNDAY (Lat. *sexagesima*, i.e., *dies*, the 60th day), the second Sunday before Lent, and roughly reckoned the 60th day before Easter.

SEXAGESIMAL, a mode of arithmetical calculation introduced by the ancient Greek astronomers, especially by Ptolemy (q.v.), into astronomical and geometrical reckoning. It was founded upon the division of the circle into 360 parts, and, the radius being nearly $\frac{1}{2}$ of the circumference, was considered to contain 60 of these parts or degrees. Continuing the same mode of subdivision, each degree (°) on the radius was divided into 60 minutes (′), each minute into 60 seconds (″), and thirds (″″), fourths (″″″), etc., followed in the same relation to each other. Addition and subtraction are not altered in this method, but multiplication, division, and the extraction of roots are so to a considerable extent. Multiplication, the most used of these three operations, was carried on in the descending scale, as in the following example, where $\lambda\alpha^{\circ}\delta^{\prime}\kappa^{\prime\prime}$ is to be multiplied by $\kappa\delta^{\circ}\iota\eta^{\prime}\nu\delta^{\prime\prime}$, or (substituting Arabic numerals) $81^{\circ}4^{\prime}27^{\prime\prime}$ by $29^{\circ}18^{\prime}54^{\prime\prime}$:

$$\begin{array}{r}
 31^{\circ} \quad 4^{\prime} \quad 27^{\prime\prime} \\
 29^{\circ} \quad 18^{\prime} \quad 54^{\prime\prime} \\
 \hline
 899^{\circ} \quad 116^{\prime} \quad 783^{\prime\prime} \\
 558^{\prime} \quad 72^{\prime\prime} \quad 486^{\prime\prime\prime} \\
 1674^{\prime} \quad 216^{\prime\prime} \quad 1458^{\prime\prime\prime} \\
 \hline
 899^{\circ} \quad 674^{\prime} \quad 2,529^{\prime\prime} \quad 702^{\prime\prime\prime} \quad 1458^{\prime\prime\prime\prime} = 910^{\circ} \quad 56^{\prime} \quad 21^{\prime\prime} \quad 6^{\prime\prime\prime} \quad 18^{\prime\prime\prime\prime}
 \end{array}$$

Here, each of the three numbers, 31, 4, 27, is multiplied by 29; the same three by 18, and the results placed in the line below, one step to the right; and again by 54, and the results placed another step to the right. This arrangement proceeds on the principle that the product of degrees by minutes gives minutes; of minutes by minutes, seconds; of minutes by seconds, thirds; and, in general, the denomination of a product is indicated by the sum of the marks superposed on the two factors. The columns are added and rearranged by reduction (q.v.). This system, though clumsy and intricate, was a great improvement, as regards facility and accuracy, on the former Greek method; and so much was it admired that succeeding geometers founded on it a complete system of general calculation, and a work on sexagesimal computation was written by Barlaam, who died in 1348. It is almost unnecessary to state that the terms minutes, seconds, thirds, etc., here employed only denote sixtieths, sixtieths of sixtieths, etc., and have no other signification; further, that the degrees, minutes, and seconds in the multiplier are, for the time being, merely abstract units and parts of units. The operation of modern arithmetic known as *duodecimal multiplication* is effected in the same way, the subdivisions being twelfths in place of sixtieths.

SEXTANT, an instrument for measuring the angular distance of objects by means of reflection. The principle of its construction depends upon the theorem, that *if a ray of light suffer double reflection, the angle between the original ray and its direction after the second reflection is double that of the angle made by the reflecting surfaces*. Thus let A and B (fig. 1) be two mirrors perpendicular to the same plane, and inclined to each other, and let SA be a ray of light, which falling upon A is reflected on B, and re-reflected in the direction BC, then ACB is the angle between the original and finally reflected rays, and ADB is the angle between the mirrors. Now, as the angle of reflection is equal to the angle of incidence $\angle SAF = \angle BAD$, and $\angle GBA = \angle DBC$; but $\angle EBC = \angle BAC + \angle BCA = (\angle BAD + \angle DAC) + \angle BCA = (\angle BAD + \angle SAF) + \angle BCA = 2 \angle BAD + \angle BCA$; and $\angle EBC$ also $= \angle EBD + \angle DBC = \angle EBD + \angle GBA = 2 \angle EBD = 2 \angle BAD + 2 \angle BDA$; therefore $\angle BCA = 2 \angle BDA$, which proves the truth of the theorem. The instrument of which this theorem is the principle is a brass sector of a circle in outline; the sector being the sixth part of a complete circle, for which reason the instrument is called a *sextant*. Fig. 2 shows the essentials of its construction; AMN is the sector whose curved side, MIN, is the sixth part of a circle; A is one mirror wholly silvered, placed perpendicular to the plane of the sector, and on, and in line with, the limb AI, which is movable round a joint at or near A; B is the other mirror, also perpendicular to the plane of the instrument, and silvered on the lower half only, the upper half being transparent; E is an eyelet-hole or small telescope. The graduation runs from N to M (on a slip of silver, platinum, or gold let into the rim), and is so adjusted that when the movable limb is drawn toward N till the mirrors A and B are parallel, the index, which is carried at the foot of the movable limb is opposite zero on the graduation. If we suppose that this zero-point is at N, it is evident that the angle between the mirrors is equal to the angle NAI; and again, if instead of graduating from 0° at N to 60° at M, which is the proper graduation for the sixth part of a circle, the graduation be made from 0° to 120° , that is, each half-degree being marked as a degree, and similarly of its aliquot parts, then the angle NAI, read off by the index at I, will show at once the angle between

FIG. 1.

the incident and finally reflected rays. The mode of using the sextant consists in placing the eye to the telescope or eyelet hole, and observing one object directly through the unsilvered part of B, and then moving the index till the image of the other object, reflected from A upon the silvered part of B, coincides with, or is opposite to the first object, then the angle, read off at I, gives the angle between the objects. For additional accuracy, a vernier is attached to the foot of the movable limb.

The sextant is capable of very general application, but its chief use is on board ship to observe the altitude of the sun, the lunar distances, etc., in order to determine the latitude and longitude. For this purpose it is necessary to have stained glasses interposed between the mirrors A and B, to reduce the sun's brightness. These glasses (generally three in number) are hinged on the side AM, so that they may be interposed or not at pleasure. B is the glass through which the horizon is perceived, and has hence received the name of the *horizon-glass*; while the other mirror, from its being attached to the index-limb, is called the *index-glass*.

The sextant is liable to three chief errors of adjustment; 1° if the index-glass be not

FIG. 2.

perpendicular to the plane of the instrument; 2° if the horizon-glass be not perpendicular to the plane of the instrument; and 3° if, when the mirrors are parallel (which is the case when a very distant body, such as the sun or moon, is observed directly through B, and found to coincide with its image in the lower part of B), the index does not point accurately to 0° ; this last is called the *index-error*, and is either allowed for, or is remedied by means of a screw, which moves the index in the limb AI, the latter being stationary. The first two errors are also frequently remedied by means of screws working against a spring, but in the best instruments the maker himself fixes the glasses in their proper position.—The *quadrant* differs from the sextant only in having its arc the fourth part of a circle, and being consequently graduated from 0° to 180° ; the *octant* contains 45° , and is graduated from 0° to 90° ; while the *repeating-circle*, which is a complete circle, is graduated from 0° to 720° . A common form of the sextant is the “snuff-box” sextant, which is circular in shape, and as it can be conveniently carried in the pocket, is the form most frequently used by land-surveyors.

The idea of a reflecting instrument, on the principle of the sextant, was first given by Hooke about 1666; but the first instrument deserving the name was invented by John Hadley (q.v.) early in the summer of 1730, and a second, and much improved form of it, was made by him a short afterward. Halley, at a meeting of the royal society, claimed for Newton the priority of invention; and in Oct., 1730, a Philadelphian, named Godfrey, also asserted his claim as the original inventor, but that learned body decided that Newton's claim was unsupported by even probable evidence, and that Hadley's and Godfrey's inventions were both original, but that the second form (which is almost the same as the common sextant now employed) of Hadley's instrument was far superior to his first form and to Godfrey's. See *illus., CIRCLE, ETC., vol. III.*

SEXTON (corrupted from SACRISTAN, q.v.), is a parochial officer in England, whose duty is to take care of the things belonging to divine worship. He is usually chosen by the inhabitants, but often also by the minister or the churchwardens, the mode of appointment being regulated by the custom of each parish. He sometimes also holds the office of parish-clerk. Women have occasionally been appointed sextons, this being one of the offices which women may fill, and they also have a vote in elections. The office is a freehold office for life, except in the new parishes under church-building acts; the duty is to keep the church clean, swept, and adorned; to open the pews; to make and fill up the graves; to prevent any disturbance in church. The salary is paid by the churchwardens, and as to amount depends on custom. In Scotland the beadle performs similar duties, and is appointed by the heritors.

SEXTUPLET, in music. When a note is divided into six parts instead of the usual division into four—as, for instance, a minim into six quavers, or a crotchet into six semiquavers—the group is called a sextuplet, and the figure 6 is generally placed above it. The proper sextuplet is composed of three groups, of two notes each, being, in fact, a

triplet (q.v.), with each of its notes subdivided into two:

But a group composed of two successive triplets is sometimes, though not very correctly, also called a sextuplet and written as such, though it is more correct to divide it

into its component two triplets thus:

SEXTUS EMPIRICUS, lived in the first half of the 3d c., and connected himself with the school of the Empirics. He was a pupil of Herodotus of Tarsus who was probably contemporary with Galen. Nothing is known concerning his life, except that he was a physician, and of the school of the Empirics; but in his writings his philosophical opinions are sufficiently clear. His first work, the celebrated *Pyrrhonian Imaginations*, is a repository of the doctrines of the skeptics, his second, in 11 books, attempts to refute every item of positive knowledge that man has ever acquired. Both works combined furnish the best account extant of ancient skeptical thought and its methods of assailing all manner of opinions. Though occasionally sinking into mere dispute about words, Sextus generally hunts down with sharp and persevering pursuit every idea, real or supposed, and subjects it to skeptical distillations. Skepticism, he says, is the disposition to doubt of everything beyond mere phenomena, and he adheres rigidly to his definition. It surprises thinking men to find that the same problems which, 16 centuries ago, perplexed philosophers, are still tasking the brains and exciting the feelings of their successors, at the present day, and that essentially there is no new skepticism under the sun.

SEYCHELLES' COCOA-NUT, or DOUBLE COCOA-NUT, *Lodoicea seychellarum*, a palm, of which the fruit has some resemblance to a cocoa-nut, although it belongs to a different tribe of palms, being allied to the Palmyra palm. It is found only in the Seychelles islands; and the fruit, wafted by the winds to the shores of the Maldivé islands, or found floating in the Indian ocean, was long the subject of many ridiculous fables, and is still an object of interest and curiosity, and as such one of the minor articles of com-

merce. The tree grows to the height of 50 or 60 ft., with a tuft of immense leaves. The wood and the leaves are used for a variety of purposes, like those of other palms. The "cabbage" or terminal bud is eaten. The fruit is often a foot or a foot and a half long, in shape like a melon, its outer husk green, the interior near the base divided into two parts, at first filled with a white sweet jelly, which changes into a white horny kernel. The shells are used for making vessels of various kinds, often beautifully carved and ornamented.

SEYCHELLES ISLANDS, situated nearly in the center of the Indian ocean, between 3° 30'–5° 45' s. lat., and 55° 20'–56° 20' e. long., a group of more than 30 isles, resting on an extensive bank of sand and coral, and forming the most important of the dependencies to the colony of Mauritius. The principal are Mahé, Praslin, Silhouette, La Digue, Curieuse, St. Anne, Aux Cerfs, Frégate, Marianne, Longue, and Du Sud Est. Mahé, the most considerable and populous of the group, and the seat of government, is 16 m. long, and from 3 to 5 broad. The islands are mountainous, often rising abruptly from the sea, and are clothed with the most luxuriant verdure; one of the peaks, named Mont Blanc, in Mahé, attains an altitude of 3,240 feet. The principal port is Victoria, on the n.e. side of the island of Mahé, the houses of which used to be built chiefly of wood; but now coral is universally employed. Coral is growing very rapidly all round this group of islands. At fort Victoria, where the soundings were recently given at 7 fathoms, the coral has piled itself up to within 2½ fathoms of the surface. In the neighborhood of fort Victoria there is a beautiful church built of coral. Many improvements have been made also in others of these small islands.

The Seychelles islands were known to the early Portuguese navigators, who bestowed on them the titles of isles de Mascarenhas; subsequently the French renamed them îles la Bourdonnais, and finally changed their appellation in honor of the count Hérault de Seychelles. They were first settled by the French in 1756, who commenced the cultivation of spices, under circumstances so favorable as to induce a belief in a lucrative competition with the more easterly colonies of the Dutch. The immunity of the Seychelles islands from the hurricanes which periodically visit the neighboring seas rendered them peculiarly suited for this purpose, which, however, received a severe blow by the suicidal destruction of the spice-plants by the French occupants, to prevent their falling into the hands of the English in 1778. The cultivation is now checked by insufficiency of labor. On the cession of Mauritius the Seychelles islands were finally taken possession of by Great Britain. The islands produce a large quantity of timber suitable for ship-building purposes; and the Seychelles cocoa-nut, which is indigenous only in the Seychelles islands, and the nuts, leaves, etc., of which are applied to a great variety of domestic purposes by the natives. Sugar is cultivated to a small extent. Cotton flourishes here, but its cultivation has declined since the abolition of slavery. The chocolate plant and vanilla are grown, and tortoise-shell is among the articles of commerce. Area of group, 100 sq. m.; pop. '91, 16,440.

SEYFFARTH, GUSTAV, D.D., PH.D., b. Uebigau, Saxony, 1796; studied at Leipsic university, where he was professor extraordinary of archæology, 1826–55. Emigrating to America, he was professor in the Lutheran seminary in St. Louis, Mo., 1855–71. In 1857 he published at New York a *Summary of Recent Discoveries in Biblical Chronology, Universal History, and Egyptian Archæology*, in English and German. His works in German and Latin are very numerous. He d. 1885.

SEYMOUR, a city in Jackson co., Ind.; on the Baltimore and Ohio Southwestern, the Evansville and Richmond, and the Pittsburg, Cincinnati, Chicago, and St. Louis railroads; 59 miles s. of Indianapolis. It has flour, woolen, planing, and hominy mills, furniture and cigar factories, the machine shops of the Baltimore and Ohio Southwestern railroad, public library, high school, electric lights, national and state banks, and daily and weekly newspapers. Pop. '90, 5337.

SEYMOUR, FAMILY OF. This family, whose history is largely interwoven with that of England, was originally settled at St. Maur—whence its name—in Normandy. Coming over to England, the Seymours obtained lands in Monmouthshire as early as the beginning of the 13th century. They acquired estates at Hatch Beauchamp, Somersetshire, by marrying an heiress of the Beauchamps early in the 15th century. In 1497 we find the head of the family, sir John Seymour, employed in suppressing the insurrection of lord Audley and the Cornish rebels, and subsequently accompanying king Henry VIII. to his wars in France, and to the field of the cloth of gold. Of the issue of this worthy knight one daughter became the wife of Henry VIII., and mother of Edward VI.; one son, Thomas, created lord Seymour of Sudeley, became lord high admiral of England, and the second husband of Henry's widow (Catherine Parr), and ended his life on the scaffold, being attainted of high treason. Sir John's eldest son, Edward, who held many high positions in the court of Henry, was created lord Seymour of Hache, and duke of Somerset in 1546–47. He had been sent into France by Henry to settle the disputed question of the border of the English possessions there, and secured the confidence of the king so far that he was left by him one of his executors and one of the council of the young prince Edward. He was subsequently made lord high treasurer, and eventually "protector and governor of the King and his realms." (See EDWARD VI.) His subsequent fall, after a two years' tenure of his all but regal power by the influence of Dudley, earl of Warwick, and duke of Northumberland, was followed by an attainder of his honors, which was not reversed for more than a century.

The eldest son of the protector by his second marriage, being created by Elizabeth earl of Hertford, married the lady Catharine Grey, a grand-niece of Henry VIII., sister of the unfortunate lady Jane Grey—a marriage which entailed on him a long imprisonment and a heavy fine. His grandson, who succeeded him in the earldom of Hertford, was also sent to prison in the tower of London for marrying the lady Arabella Stuart, cousin of James I. of England; but subsequently, playing a conspicuous part in the royal cause in the civil wars, obtained in his own favor a reversal of his ancestor's attainder (see above), and in 1660 took his seat in the house of peers as second duke of Somerset, although the descendants of the first duke, by his first marriage, were then in existence. He died in 1675, and his ducal title passed to a cousin, on whose death it was inherited by Charles Seymour, known in history as the "proud duke of Somerset," a nobleman whose style of living was ostentatious and haughty in the extreme, and who filled several high posts in the courts of Charles II., William III., and Anne. He married the heiress of the Percies, by whom he had a son, Algernon, 7th duke, who was created earl of Northumberland, with remainder to his son-in-law, sir Hugh Smithson, the ancestor of the present Percy line. On the death of this duke a curious peerage case arose, the title being claimed by the descendants of the first duke by his first marriage, on the failure of the younger branch; and the attorney-general having reported in favor of the claim, sir Edward Seymour took his seat in the house of peers as 8th duke.

SEYMOUR, GEORGE FRANKLIN, b. New York, 1829; graduated at Columbia college, 1850, and at the general theological seminary, Protestant Episcopal, 1854; was a missionary at Dobbs' Ferry for several years; principal of St. Stephen's college, Annandale, 1860; pastor of St. John's church, Brooklyn, 1863; elected professor of church history in the general theological seminary; chosen bishop of Illinois in 1874, but failed of confirmation by the general convention; was chosen dean of the seminary in 1875, and bishop of Springfield, Ill., in 1878.

SEYMOUR, HORATIO, LL.D., b. N. Y., 1810; received an academic education, studied law, but did not practice. He devoted himself after 1832 to the settlement of the paternal estate; and in 1841 went to the state assembly, to which he was re-elected three times, being speaker in 1845. In 1852 he was elected governor of the state and again in 1862, and was earnest in employing his power and influence for the prosecution of the war for the union, and especially in suppressing the draft riots in 1863. In 1868 he received the nomination of the democratic party for the presidency, with Gen. Francis P. Blair, jr., as vice-president. The ticket was defeated by Grant and Colfax. Mr. Seymour then remained in retirement on his farm at Deerfield, N. Y., near Utica, although his name was prominently considered for the democratic nomination for president in 1880. He became president of the national dairymen's association, and of the prison association of the United States; he devoted much attention to agricultural questions, and frequently delivered addresses before agricultural bodies. His reputation was that of a profound statesman and astute politician. He d. 1886.

SEYMOUR, THOMAS DAY, born in Hudson, Ohio, in 1848, graduated from Western Reserve College in 1870; studied at Leipzig and Berlin, 1870-72; was professor of Greek at Western Reserve College from 1872 to 1880, when he was appointed to his present position of professor of Greek at Yale College. He is Chairman of the Managing Committee of the American School of Classical Study at Athens, an editor-in-chief of the College Series of Greek authors, and one of the American editors of the Classical Review. He has published *Selected Odes of Pindar* (1882); *Introduction to Homeric Languages and Verse* (1885); *Homer's Iliad, Books I-III* (1887); *Vocabulary to the first six books of the Iliad* (1889); *Homer's Iliad, Books IV-VI* (1890), and articles in various periodicals.

SEYMOUR, THOMAS HART, 1808-68; b. Conn.; studied at the military academy, Middletown, Conn.; practised law, and was made judge of probate. In 1837 he edited the *Jeffersonian*, a democratic newspaper; in 1843 was a member of congress; and on the breaking out of the Mexican war, volunteered and rose to be maj. and colonel. In 1850-53 he was governor of Connecticut; and 1853-57 minister to Russia.

SEYMOUR, TRUMAN, b. Vt., 1824; graduated at West Point, and served through the Florida and Mexican wars. He was under Maj. Anderson at Fort Sumter in 1861; afterwards commanded a brigade under Meade, led a division at the assault on Fort Wagner in 1863, commanded an expedition to Florida in 1864, and a division in the Richmond campaign. He was brevetted maj.-gen., U. S. army; retired, 1876. D. 1891.

SFORZA, a celebrated Italian family, which played a most important part in the affairs of Italy during the 15th and 16th centuries, swayed the destinies of northern Italy for many years, and allied itself with the first sovereign houses in Europe. Its founder was a peasant of Cotignola, in the Romagna, by name *Giacomo*, or *Muzio* (sometimes combined by historians into *Giacomuzzo*) *Attendolo* (born 1369), who deserted his trade of wood-cutting to become a "condottiere," and by his intelligence and courage rose to a high position in the band to which he belonged. Count Alberigo de Barbiano, the founder of Italian "condottierism," bestowed upon him, on account of his prowess, the name of *SFORZA* (Ital. "the forcer"); and such was his reputation among his comrades, that he speedily found himself the independent leader of a band of condottieri, and offered his services to the king of Naples. Queen Joanna II. made him constable of that kingdom, and in exercise of his office, he chased away the Aragonese, and

others, who attempted to deprive her of her dominions; but dying soon after (Jan. 4, 1424), he left his devoted followers to the chieftainship of his natural son, FRANCESCO SPORZA, then 23 years of age, who was as brave and enterprising as himself. Francesco, as was the custom of the time, sold his sword to the highest bidder, and without the slightest scruple fought for or against the pope, Milan, Venice, and Florence. He invented an improved system of tactics, and it soon came to be taken for granted that victory was certain for the party which he supported. It was thus no great act of condescension in the duke of Milan, the haughty Visconti, to confer upon him the hand of his daughter Bianca, with Cremona and Pontremoli as a dowry, and the promise of succeeding to the duchy itself. Meantime, Sforza took the march of Ancona from the pope (1434), added to it Pesaro (1443), and by a judicious combination of force and stratagem, obtained his elevation to the dukedom of Milan (Feb. 26, 1450), after the decease of his father-in-law. He solidly established his authority over all Lombardy, and several districts s. of the Po; acquired the esteem of Louis XI., who gave up to him Savona and Genoa; and after gaining the universal love of his subjects, died Mar. 8, 1466. Though uninstructed, he possessed considerable eloquence, and loved and protected letters. The successors to his power possessed few or none of his distinguished talents. His son, GALEAZZO MARIA SFORZA (1466-76) was a true tyrant, gloating over the torments of his victims, and a monster of debauchery, prodigality, and ferocity, without a single redeeming feature in his character. He was assassinated (Dec. 26) at the porch of the cathedral of Milan. His son GIOVANNI GALEAZZO SFORZA (1476-94) succeeded under the regency of his mother, Bona of Savoy, who held the reins of government with a firm hand. But she was forced to give up (1480) her able coadjutor, Simonetta, to the vengeance of her brother-in-law, Lodovico Maria, surnamed "the Moor," from his dark complexion; and three days after Simonetta's execution, the ambitious Lodovico banished herself, and assumed the regency. Finding the young duke in his way, Lodovico put him and his wife, Isabella of Calabria, in prison, and was immediately threatened with attack by the king of Naples, a danger which he attempted to ward off by giving his daughter, Bianca, with a dowry of 400,000 ducats, to the emperor Maximilian I., and by stirring up Charles VIII. of France to assert his claims to Naples. Soon afterward, duke Giovanni Galeazzo died, poisoned as some believe, by his uncle, Oct. 20, 1494. Lodovico MARIA (1494-1500) obtained his investiture as duke, and becoming alarmed at the rapid progress of the French in Italy, he joined the league against them, and was rewarded for his perfidy by being driven from his duchy, which was seized by the troops of Louis XII. (1499). The following year he made an ineffectual attempt to regain possession, was made prisoner, and carried to France, where he died about 1510. He possessed great talents, combined unfortunately with a low morality, which led him to value astuteness more than everything else; but his encouragement of letters and of the fine arts will preserve his name to posterity. His eldest son, MASSIMILIANO SFORZA (1512-15), regained the duchy of Milan after the reverses suffered by Louis XII., and with the aid of the Swiss steadily repulsed the various energetic attempts of the French to recover it; but after the battle of Marignan (1515), he abandoned his rights to the French for a pension of 30,000 ducats, glad to be free from the insolence and exactions of his allies, and the attacks of his enemies. His brother FRANCESCO MARIA SFORZA succeeded nominally to the Milanese after the battle of Pavia, but he was a mere puppet in the hands of Charles V., and on his death, Oct. 24, 1535, and the extinction of the main line of the house of Sforza, the duchy was quietly swallowed up by Austria. The lords of Pesaro (extinct in 1515), the counts of Santa-Fiora in Tuscany, still existing, and the dukes of Sforza-Cesarini, descend from collateral branches of the family.

SFORZA TO (Ital. forced), in music, often contracted *sf*, a term used to indicate that the note over or under which it is placed is to be played with strength and emphasis. A higher degree of emphasis is indicated by *sf*, or *sforzato assai*.

'SGRAVESAN DE, WILLEM JAKOB VAN, 1688-1742; b. Holland; educated at Leyden and Leipsic. In 1717 he was appointed professor of astronomy and mathematics, and in 1734 professor of philosophy, at the university of Leyden. His chief works are *Physices Elementa Mathematica* (1720); and *Philosophiæ Newtonianæ Institutiones* (1723).

SHACKELFORD, a co. in n.w. central Texas; drained by branches of Brazos river; 900 sq.m.; pop. '90, 2012, chiefly of American birth, with colored. The surface is mostly prairie land and adapted for grazing. Cattle are exported. Co. seat, Albany.

SHAD, *Alosa* or *Alosa*, a genus of fishes of the family *clupeide*, differing from *clupea* (the herring, etc.) in having the upper jaw deeply notched. The teeth are very small, on the jaws only, and often wanting, at least in the adult fish. The species are numerous, inhabiting the sea, but some of them ascending rivers like the salmon, and spawning there. They are very like herrings in form and appearance, and on this account, and their large size, the British species receive from Scottish fishermen the name of *king of the herrings*. The herrings of extraordinary size, of which the capture is sometimes reported, are probably always shad.—The COMMON SHAD, or ALLICE SHAD (*A. com muni*), is rather thicker and deeper in proportion to its length than the herring. It is found on the British coasts, and in the lower part of some of the large rivers, more abundantly in the Severn than in any other British river. It attains a length of two or even three feet, and a weight of from four to eight pounds. It has no teeth. There is

a single black spot behind the gills. Its flesh is of good flavor. The *TWAITE SHAD* (*A. finta*) is more plentiful on the British coasts, and is the common shad of the Thames, but the foul state of the river has now made it of very rare occurrence above London. It is smaller than the *Allice shad*, seldom exceeding 16 in. in length; there are small teeth in both jaws, and a row of dusky spots along each side of the body. The flesh is coarser, and less esteemed than that of the *Allice shad*, but much used for food wherever the fish is plentiful. This species spawns later in the year than the last, and in order to permit it to deposit its spawn, its capture in the Thames is prohibited after the end of June. It abounds in many of the rivers of France, and other parts of Europe.—A species of shad, generally weighing about four or five pounds, but sometimes twelve pounds, is very abundant during some months of the year in some of the North American rivers, as the Hudson, Delaware, Chesapeake, and St. Lawrence, and forms an important source of wealth.

The most generally esteemed species of shad are the *alosa vulgaris* and *alosa finta* of western Europe, the *alosa sapidissima* of the eastern United States, and the *alosa reevesii* of the Yang tse-Kiang in China. The American and Chinese species are held in the highest regard, the shad of the Connecticut river being the finest in America. They attain to the best condition, and sometimes weigh five or six pounds, the average being about four. The North river shad is somewhat smaller, and those of the Delaware, and rivers further south being rather smaller still. While in the sea shad are said to live chiefly on small crustaceans, but when ascending rivers they eat but little. For several years until recently the supply of shad decreased in most of our rivers, especially the Hudson; but they are said to have become more plentiful, owing to the efforts of the fish commissioners. They have been introduced into the Pacific rivers, and increased in the Mexican gulf waters. It has been attempted to introduce American shad into Germany, but not successfully, on account, it is said, of the shortness of the hatching period there.

SHADDOCK, *Citrus decumanus* (see CITRUS), a tree, which, like the other species of the same genus, is a native of the East Indies, and which has been long cultivated in the s. of Europe. It is said to derive its English name from a Capt. Shaddock, by whom it was introduced into the West Indies. It is readily distinguished from most of its congeners by its large leaves and broad-winged leaf-stalk; it has very large white flowers, and the fruit is also very large, sometimes weighing 10, or even 14 pounds, roundish, pale yellow; the rind thick, white and spongy within, bitter; the pulp greenish and watery, subacid, and sub-aromatic. It is a pleasant, cooling fruit, and much used for preserves. The tree is rather more tender than the orange, but with proper care is often made to produce fine fruit in orangeries.

SHADOW is a portion of space from which light is debarred by the interposition of an opaque body. If the luminous body be too near, or too large to be considered as a mere point, then each atom of the light-giving surface throws its own shadow independent of the others. We have thus in reality a multiplicity of shadows overlapping each other, and forming what in common parlance is "a" shadow of the opaque body, which is darkest at those places where all the separate shadows overlap each other, and becomes lighter as it gradually falls beyond the limits of more and more of these separate shadows. See PENUMBRA. The depth of a shadow depends from mere force of contrast on the intensity of the light around it; it also depends much on the nearness of the object, as compared with its size, to the surface upon which the shadow is thrown; for the rays of light, by their properties of reflection, refraction, and dispersion, tend to bend "round" the opaque object, and the increase of distance between an object and its shadow allows more scope for this action.

SHAD TREE, or SHAD BUSH. See JUNE-BERRY.

SHADWELL, THOMAS, a dramatic writer of some note in his day, though now only remembered as the "Mac-Flecknoe" of Dryden's satire, was b. in 1640 in Norfolk. He was educated for the law, but not finding it a pursuit to his mind, he deserted it, and, after an interval of foreign travel, betook himself seriously to literature. His first comedy of *The Sullen Lovers* (1668) had great success, and he continued from year to year to entertain the town with a succession of similar pieces, a complete edition of which was published after his death in 4 vols. 12mo. The immortality which these must have failed to achieve for him, he was fated to attain in a way somewhat less desirable. With Dryden he seems, in the earlier portion of his career, to have been on terms of friendly intimacy; but literary jealousies divided them, and the quondam friend became a favorite butt for the shafts of Dryden's deathless ridicule. Though his works—hasty and careless as they are—exhibit lively talent and considerable comic force, all that the literary world now knows of Shadwell is that "Shadwell never deviates into sense." It might a little console him, under the satire of his enemy, that he succeeded him in the post of poet-laureate, which in 1688 it became necessary for Dryden to resign. He did not long survive to enjoy it, however, as in 1692 he died, it is said of an overdose of laudanum, a drug in which he was wont to indulge himself.

SHAFITES, the name of one of the four principal sects of the Sunnites (q.v.), or "orthodox" Moslems. Its name it received from its founder, Abu Abdallah Moham-

med Ibn Idris, called Al-Shafei, from one of his ancestors who descended from Mohammed's grandfather.

SHAFT, the body of a column, extending between the base and capital. In Gothic architecture the term is applied to the small columns clustered round piers, or in the jambs of doors and windows. In the early styles the shafts are frequently of finer material than the pier, such as Purbeck marble, and polished and banded. In later examples the shaft is generally attached, and of the same piece as the pier. For illustration see COLUMN.

SHAFTESBURY, commonly called SHASTON, a very ancient town of England, and a municipal borough in Dorsetshire, 19 m. s.w. of Salisbury. It stands on the narrow ridge of a chalk hill, and commands extensive and beautiful views of the counties of Dorset, Somerset, and Wilts. There is some agricultural trade. The date of its foundation is unknown, but it seems to have been a Roman station. In the reign of Athelstan (924-940) it contained two mints and an abbey of Benedictine nuns. Here Canute the Great died in 1036. Pop. '91, 2122.

SHAFTESBURY, ANTHONY ASHLEY COOPER, Earl of, English statesman and philanthropist, is descended from a family intimately associated with the political history and literature of England. Sir John Cooper of Rockbourne, Hampshire, married Anne, daughter and sole heiress of sir Anthony Ashley of Wimborne, St. Giles, Dorsetshire, secretary-at-war in the reign of queen Elizabeth. Their eldest son, sir Anthony Ashley Cooper (born 1621), was actively engaged in public affairs during the civil wars. He first espoused the cause of royalty; he then became one of the most eminent of the parliamentary leaders in the council, and not the least active in the field. When he saw that the restoration was inevitable, he took so prominent a part in bringing back Charles II. that he was raised to the peerage as baron Ashley. He was a member of the justly infamous "Cabal" ministry, and was afterward appointed to be lord chancellor, with the earldom of Shaftesbury. He was the "Achitophel" of Dryden, by whom his character is drawn with as much truth as power. He hated a calm, lived all his life in intrigues, and in his 62d year his "fiery soul" wore out his small and fragile body. He will be honored for all time by men of English race and descent as the author of the habeas corpus act. He also first introduced a bill rendering the judges independent of the crown.—His grandson, ANTHONY COOPER, third earl (born 1671, died 1713), author of the *Characteristics*, the friend of Pope, and the other celebrities of the Augustan age, obtained from Voltaire the questionable praise of being the boldest of the English philosophers.—The sixth earl was for many years chairman of committees of the house of lords.

His son, ANTHONY ASHLEY COOPER, seventh earl of Shaftesbury, was b. in Grosvenor square, London, April 28, 1801. He was sent to Harrow, and thence to Christ Church, Oxford, where he obtained a first-class degree in classics in 1822. He represented the borough of Woodstock from 1826 to 1830; the county of Dorset (in which the family estates are situated) from 1831 to 1846; and the city of Bath from 1847 to 1851, when he succeeded to the earldom. During his long career in the lower house he held one or two subordinate posts. He is better known by his attempts to improve the social condition of the laboring classes. As he belonged to the conservative party, and represented an agricultural county, the manufacturers, and their organs in the press, received his allegations respecting the condition of their operatives in a hostile and antagonistic spirit, and retorted that the wages of families engaged in factories amounted to twice and three times the sum paid to the Dorsetshire laborers. Yet lord Ashley returned again and again to the charge; and on the death of Mr. Sadler, M.P., took charge of the ten hours' bill. The manufacturers declared with alarm that any reduction in the hours of labor would be fatal to our manufacturing supremacy. Successive governments naturally believed these prophecies, and almost all the leading statesmen of the day opposed the ten hours' bill. But public opinion declared in favor of a limitation of the hours of labor. Lord Ashley carried his bill through parliament, and has the satisfaction of knowing that the opponents of the measure admit, without an exception, that it was an act of wise and beneficent legislation, and that their alarms were groundless. When he visited the manufacturing districts, he was honored with an enthusiastic ovation. He refused to join sir R. Peel's administration in 1841 because that statesman refused to countenance the ten hours' bill. In 1846 he supported sir R. Peel in his proposal to repeal the corn laws, an act which cost him his seat for Dorsetshire. When he successfully contested Bath against Mr. Roebuck in 1847 he appeared on the field of politics as a "liberal conservative." After his accession to the earldom, Shaftesbury took a more prominent part in connection with various religious, social, and philanthropic societies. These are so numerous that a list of the associations with which he was in some way officially concerned, would include almost every scheme having for its object the physical, moral, and spiritual improvement of society. He belonged to the evangelical party in the church of England, and was a prominent member of the chief church societies. He was married to a daughter of the fifth earl Cowper, and being thus a connection by marriage of the late viscount Palmerston (whose government he steadily supported), many of the ecclesiastical appointments and promotions of evangelical clergymen made by that minister were attributed to his influence. He followed up

the ten hours' bill by obtaining the assent of parliament to other measures regulating defective workshops and factories, night-work, and the treatment of children by their employers. Among honors that were conferred on lord Shaftesbury are the Oxford degree of D.C.L. in 1841, and the honorary citizenship of Edinburgh in 1878. He d. 1885.

SHAG. See CORMORANT.

SHAGREEN is generally understood to mean shark skin dressed and rubbed down smooth or not; but the oriental shagreen, formerly in so much repute, consists of portions of the skins of horses, asses, camels, and oxen, the part used being strips taken from head to tail, along the center of the back. These strips are prepared by soaking in water, and currying; and when in the proper condition, they are laid on the ground, and the seeds of *chenopodium album* are sprinkled over them; a board or piece of felt is then placed on the seeds, and by pressure the hard seeds are forced deeply into the skin, which is then hung to dry. When dry, the seeds are removed by shaking, and the skin pared down with a proper knife nearly, but not quite as low, as the bottom of the depressions caused by the seeds. After this the skin is again soaked, and the parts compressed by the seeds now rise up and form elevations, which are increased by washing in a solution of salt. The last operation is dyeing them of various colors, green being the favorite one. Owing to the difference of texture produced by the operations of compressing by the seeds, paring, etc., the color is taken irregularly; and when dyed green, the material somewhat resembles malachite in appearance when dried and polished. It was at one time a very favorite material in its use for covering small cases and caskets of various kinds, especially spectacle-cases.

SHAH (Persian, *prince, king*), the general title of the supreme ruler in Persia, Afghanistan, and other countries of southern and central Asia. The sovereign, however, may, and frequently does, decline the title, assuming in its place that of *khan* (q.v.), an inferior and more common appellation. The same title can also be assumed by any of the shah's sons, and upon all the princes of the blood the cognomen *shah-zadeh* is bestowed.

SHAH-JEHAN, or "king of the world," the title assumed on his accession to the throne by Khorrum Shah, the third son of Selim Jehan-Ghir, and the fifth of the Mogul emperors of Delhi. He was during his father's reign employed in military expeditions against the Rajputs, the independent Mohammedan states of the Deccan, and the Afghan tribes around Candahar, in which he greatly distinguished himself by bravery and military skill; but on his return he was forced into rebellion (1623) by the intrigues of his enemies at court, and was still unreconciled to his father at the latter's death in 1627, when he was at once saluted as emperor by the nobles. At his accession the empire had reached the summit of its greatness, but the causes which lead to its rapid decline at the same time unmistakably showed themselves; the territory was too extensive for the system of government which was generally pursued by the Moguls; the discordant parts were unconnected by any bond of union; the supreme ruler was looked upon in many provinces as a mere tax-collector; and with the thus necessary absence of any spirit of loyalty, insurrections were frequent in all the provinces. The chief events of Shah-Jehan's reign were the war against the Deccan sovereignties, which resulted in the complete destruction of the kingdom of Ahmednuggur (1631), and the subjugation (1636) of those of Beejapur and Golconda; an indecisive contest against the Uzbeks of Balkh (1644-47); two unsuccessful attempts to recover Candahar from the Persians; and a second successful war, conducted by his third son, Aurungzebe, against the Deccan princes (1655). But in 1657 the emperor fell dangerously ill, and his four sons, who were ambitious of attaining supreme power, immediately commenced to dispute regarding the succession. See AURUNGZEBE. Ultimately Shah-Jehan was taken prisoner, and confined in the citadel of Agra till his death, Dec., 1666. Shah-Jehan united the voluptuous profligacy so common in eastern monarchs with great sagacity, and the strict administration of justice to Moslem and Hindu alike. In his later years he became avaricious, increased the taxes, and confiscated the property of his wealthier subjects on the slightest pretexts. The magnificence of his court was unequalled; the splendid "peacock throne" was constructed by his orders at a cost of about £7,000,000, and many magnificent public buildings executed under his direction remain as monuments of his greatness. Chief of these are the city of Shah-Jehanabad, and the superb mausoleum of Tajmahal (see AGRA). Yet so strict was his financial management that he left a well appointed army of 200,000, and a treasury containing £24,000,000, to his son Aurungzebe.

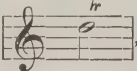

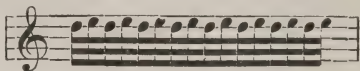

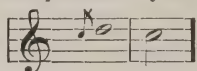

SHAHJEHANPORE, a t. of British India, the principal place of a district of the same name, N.W. Provinces. It stands on the Gurrâh, in lat. 27° 57' n., long. 79° 28' e. It has an export trade in cereals and sugar. Pop. '91, 78,552.

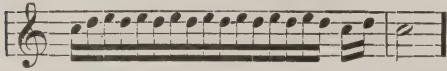

SHAH NAMEH, Book of Kings, the title of several eastern works, the most celebrated of which is the Persian poem of this name, by Firdusi (q.v.), containing the history of the ancient Persian kings in about 60,000 distichs, and written by the order of sultan Mahmud of Ghizni, in the space of thirty years. Another work, in Turkish, under the same name, comprises the history of all the ancient kings of the east, and was written by Firdusi Al-Tha'uil. Bajazet II., to whom the book was dedicated, ordered the author

to reduce it from its original bulk of 300 vols. to 80. Firdusi, however, felt so mortified at this proposal that he preferred leaving the country altogether, and emigrated to Khorassan, in Persia.

SHAIRP, JOHN CAMPBELL, LL.D.; b. Scotland, 1819; educated at Glasgow university and Balliol college, Oxford; was assistant master of Rugby school; professor at St. Andrews in 1861, and principal in 1868. Shairp published *Kilmahoe, a Highland Pastoral*; *Studies in Poetry and Philosophy*; *Lectures on Culture and Religion*; and contributed largely to periodicals. He d. 1885.

SHAKE, in music, an embellishment produced by the continued and rapid repetition of one note alternately with another either a whole tone or semitone above it. Its sign is *tr* (the first two letters of the Italian *trillo*), placed over or under the principal note.

For example:  is played thus: ; the exact number of repetitions being indefinite. A shake is often preceded by an appoggiatura (q.v.), and is very generally finished with a turn, as  played:

 We may have shakes on two notes at once; and a series of shakes on several notes is called a chain of shakes.

SHAKERS, the name commonly given to a small religious sect existing in the United States. The proper or official description of this sect is the United Society of Believers in Christ's Second Appearing; but its members seem to have accepted the designation of Shakers, though it was originally applied to them in ridicule, on account of certain rhythmical movements of the hands and arms which form part of the ceremonial of their worship. Though the Shaker societies are found only in the United States, their creed had an English origin. The founder of the sect, in whose person they believe that Christ has appeared a second time, was an Englishwoman, named Ann Lee, a native of Manchester, who emigrated to New York with a small band of disciples, shortly before the outbreak of the revolutionary war.

Ann Lee was the daughter of a blacksmith, who lived in Toad lane in Manchester; a very poor man, who gave her no education, and sent her while a mere child to work in a cotton-mill. She seems to have been a violent, hysterical girl, ambitious of notice, and fond of power, and to have always possessed, in virtue of her strong will and vehement temper, a great deal of influence over the people around her. She married while very young a blacksmith named Stanley. She had four children, all of whom died in infancy—to this, perhaps, may be ascribed the preference of the celibate to the married life, which she ultimately raised into a part of her religious system. She became one of the earliest believers in a prophetess, who appeared about 100 years ago, in the town of Bolton-on-the-Moors, in Lancashire—a poor woman, named Jane Wardlaw, the wife of a tailor, who believed she had “received a call” to go forth and testify for the truth. The burden of Jane Wardlaw’s message was, that the end of all things was at hand, that Christ was coming to reign upon the earth, and that his second appearance would be in the form of a woman, as prefigured in the Psalms. In subordination to this, she took up several of the tenets of the society of Friends, to which she and her husband originally belonged; especially, she raised her voice against war and against profane swearing. Her followers believed that she was filled with the Holy Spirit; they received her utterances as the voice of God; and she acted as if all the powers of earth and heaven had been given into her hands. Ann Lee on her conversion, began to preach the same message in Toad lane and the adjacent streets of Manchester; but she soon went beyond her teacher, and gained the leadership of her co-believers for herself. It happened that she was brought before a magistrate, charged with an obstruction of the streets, caused by the crowd collected to hear her preach, and she was sent to the Old Bailey prison in Manchester. When she came out of prison, she gave forth, that one night, a light had shone upon her in her cell; that the Lord Jesus stood before her; and that he became one with her in form and spirit. Her pretension was, that Christ was come to reign in her person. It was favorably entertained by the followers of Jane Wardlaw; and they acknowledged her as their head or mother, in place of Jane, whose pretensions had never gone so far. She found, however, that among her neighbors and fellow-workers, her claim to be the bride of the Lamb, the queen described by David in the Psalms, excited only jeering and ridicule, and she received a revelation that she should seek in America a home for herself and her few disciples—that it was in America that the foundations of Christ’s kingdom were to be laid. So she went to New York, accompanied by seven disciples—five males and two females. Her husband also went with her; but he seems to have had no faith in her, and he left her soon after their arrival, in consequence of one of the features then introduced into her system. This was the practice of celibacy, which she had not previously enforced upon her followers, though she had enjoined it as a duty. Her teaching was, that men

called into grace must live as the angels do, among whom there is no marrying or giving in marriage, that no form of earthly love could be allowed in the Redeemer's kingdom. Finding a populous city unfavorable to her designs, she removed, with her followers, first to Albany, then far into the wilderness to Niskenna, and there founded the settlement, which still exists, of Watervliet. It was in the spring of 1780—when she had been three years and a half at Niskenna, looking for new believers to come in, but making no attempt to win them—that the first American converts joined her society. A revival had taken place at Albany, and had spread through the surrounding districts; and from Hancock and New Lebanon a deputation was sent to Niskenna, to see what light its inhabitants enjoyed as to the way of salvation. The deputation consisted of Joseph Meacham and Lucy Wright—subsequently the heads of the Shaker society. These persons became believers in Ann Lee; and through their agency other converts were won, and a Shaker society established at New Lebanon. Toward the close of 1780, the revolutionary war being then in progress, notoriety was given to Ann Lee's pretensions, through an incident seemingly unfavorable. Owing to her British origin, her denunciations against war, and her refusal to take the colonial oaths, Ann was imprisoned for some time at Poughkeepsie, on suspicion of being a British spy. Before she was let out of prison, in December, 1780, all the colonies had heard of "the female Christ." In the following year, she started upon a missionary tour through New England and adjacent colonies; she found the people everywhere curious to see her, and she made not a few converts. She did not return to Watervliet till Sept., 1783; and about a year after, she died. Her death was a surprise to many of her followers, who believed that she was to live among them forever; but her successors—the Joseph Meacham and Lucy Wright already mentioned—to whom, on her death-bed, she had made over the headship of the society, were ready with a theory accounting for it. "Mother Ann," they said, could not die, and was not dead, and had not ceased to live among her people. She had only withdrawn from the common sight; she was still visible to eyes exalted by the gift of grace; she had cast the dress of flesh, and was now clothed with a glory which concealed her from the world. So it would be with every one of the saints in turn; but the spirit of those who "passed out of sight" would remain near and be in union with the visible body of believers. This explanation was generally accepted, and has become a vital part of the Shaker creed.

By Joseph Meacham and Lucy Wright, the successors of "Mother Ann," the Shakers were gathered into settlements, ten in number; and a covenant was drawn up embracing the chief points of their creed, and of the social system since associated with it. Their head was, of course, "Mother Ann"—that is, Christ—of whom Joseph and Lucy were temporarily the representatives; elders and deacons, male and female, were appointed; the institution of celibacy was confirmed; and a community of goods was introduced. On the death of Joseph Meacham in 1796, "Mother Lucy" became the sole head of the society, and she governed it with ample powers for 25 years. She named a female successor with the title of elderess; and the name of "mother" has not, since that time, been applied to the female head of the community. Eleven societies were formed between 1787 and 1792. Early in the present century a remarkable religious excitement took place in Kentucky. The Shakers, taking advantage of this movement, sent three representatives thither, and received sufficient additions to found five new societies. (See Nordoff's *Communitistic Societies of the United States*, 1875.) The Shakers were, at the census of 1890, about 2400 in number, included in 18 societies; of which three are in the state of New York, four in Massachusetts, two in New Hampshire, two in Maine, one in Connecticut, four in Ohio, and two in Kentucky. Their numbers have increased since 1870; the influence of their opinions has extended; and the 18 separate settlements continue to form a united and peaceful society.

Their doctrine has been to some extent developed as well as systematized since the death of "Mother Ann." They believe that the kingdom of heaven has come; that Christ has come upon earth a second time, in the form of "Mother Ann," and that the personal rule of God has been restored. Then they hold that the old law has been abolished, and a new dispensation begun; that Adam's sin has been atoned; that man has been made free of all errors except his own; that the curse has been taken away from labor; that the earth and all that is on it will be redeemed. Believers, on going "into union," die to the world, and enter upon a new life, which is not a mere change of life, but a new order of being. For them, there is neither death nor marriage; what seems death is only a change of form, a transfiguration which does not hide them from the purified eyes of the saints; and in union, as in heaven, there is no marrying or giving in marriage—the believer owes love to all the saints, but his love must be celibate in spirit and in fact. The believer, living in union, *is* in heaven. The Shakers believe that the earth, now freed from the curse of Adam, is heaven; they look for no resurrection besides that involved in living with them in "resurrection order." The believer, upon entering into union, leaves behind all his earthly relationships and interests, just as if he had been severed from them by death. And since to be in union is heaven, the Shakers hold that no attempts should be made by them to draw men into union: God, they say, will draw to them those whom he has chosen at his own time. Those who have "passed out of sight" are still in union; and the Shakers live in daily communion with the spirits of the departed believers. The belief in a communion with angels and

spirits is no mere theory; it has a most important influence upon their lives; they profess to be more familiar with the dead than with the living. It being the work of the saints to redeem the earth from the effects of the curse, labor is a sacred and priestly function, especially when bestowed in making the earth yield her increase, and in developing her beauty. It should be done in a spirit of love; the earth, they say, yields most to those who love it; and love and labor will in time restore it to its primitive state. According to Mr. Dixon, they bestow upon their gardens and fields the affections which other men bestow upon family or worldly goods. Their country they regard only as it is a part of the earth, which they love, and as the favored land in which God's kingdom is first to be established. In its politics and its fortunes, they take no interest; and, indeed, their whole system is a protest against the existing constitution of society, as well as against the ordinary lives of men. Consistently with their belief in the second appearance of Christ in the form of a woman, the Shakers seem to believe that there is a female as well as a male essence in the Godhead—in the motherhood as well as the fatherhood of God.

A Shaker settlement is, for convenience, divided into families, consisting of the brothers and sisters, who live in the same houses, each governed by an elder and an elderess. There are two orders of members, probationers and covenanters—that is, novices and full members. It is on becoming a covenanter that the Shaker puts his property into the common stock. On entering upon residence, he becomes subject to all the rules of the society; but he is free—whether a covenanter or a probationer—to leave the body whenever he pleases. Both men and women wear a prescribed dress. The men wear a sort of Arab sack, with a linen collar and no tie; an under-vest buttoned to the throat, and falling below the thighs; loose trousers, rather short; and a broad-brimmed hat, usually of straw. The women wear a small muslin cap, a white kerchief round the chest and shoulders, a skirt dropping in a straight line from the waist to the ankle, white socks, and shoes. Some latitude is allowed as to the materials of the dress. Men and women, it is said, have the look of persons at peace with earth and heaven. "Apart from a costume," says Mr. Hepworth Dixon, "neither rich in color nor comely in make, the sisters have an air of sweetness and repose, which falls upon the spirit like music shaken out from our village bells." [*New America*, by W. Hepworth Dixon (Lond. 1867), from which the materials of this sketch have in a great measure been derived.] All labor with their hands, both men and women; but the latter do only indoor work. Every man, whatever his rank in the church, follows some manual occupation, and most of them have more than one. Working not for gain, but with loving care, and with the sense that they are exercising a priestly function, the Shakers are unrivaled among their neighbors in the arts to which they apply themselves, especially the culture of their land, and the production of fruits and flowers. They pay great attention to ventilation and to all sanitary conditions; they live almost entirely upon the produce of the soil, and drink only water; they employ no doctors and take no drugs, and are, nevertheless, among the healthiest of communities. Their society is recruited mostly by young men and girls; but, occasionally, married persons with their children come "into union," and make, it is said, "very pretty Shakers." Husbands and wives, when they have come "into union," become as brothers and sisters: it would be thought a weakness, says Mr. Dixon, and almost a sin, for them to feel any personal happiness in each other's company—they live for God alone, and their love ought to be shed on all the saints alike. The education of the children attached to the society is the work of the sisters, and they do it exceedingly well. The brothers and sisters take their meals in a common room, eating at six in the morning, at noon, and at six in the afternoon. Their meals are taken in silence, any direction that has to be given being given by a gesture or in a whisper. In their church-service, music bears a prominent part: the hymns and chants which are used being all of Shaker origin, communicated to believers in dreams and reveries by the spirits with whom they have communion. They have an extensive doctrinal literature.

SHAKESPEARE, WILLIAM, the chief literary glory of England, was b. at Stratford-on-Avon, in Warwickshire, it is believed, April 23, 1564. Certain it is, as vouched by the parish register, that his baptism took place three days after, on the 26th. His father, John Shakespeare, seems to have belonged by birth to the class of yeomen. His mother, Mary Arden, was of more distinguished origin. She came of a good old Warwickshire family; and when married, she brought to her husband as dower a property called Asbies, 54 acres in extent, besides an interest in certain other lands at Wilmeccote, and a small sum of money. In a contemporary document, John Shakespeare is described as a *glover*; and this trade, at that time a more important one than it has since become, there is evidence to show that he conjoined with that of a farmer and rearer of stock. His earlier career was one of steady prosperity, and the consideration in which he came to be held as a citizen is shown in the fact of his having in 1569 been elected chief magistrate of Stratford. Of a family of four sons and four daughters born to him, William was the third child. At the free grammar-school of Stratford there can be no doubt the young Shakespeare received his entire education. As to the precise character and amount of this, there has been much controversial conjecture; some writers maintaining, on the internal evidence of his works, that he must have enjoyed a thorough classical

training, while others represent him as probably destitute of any such youthful advantage. The celebrated "And though thou hadst small Latin and less Greek" of his friend Ben Jonson, which has been frequently quoted as certifying his almost utter ignorance, seems, if anything, to tell the other way. It assures us that, of both languages, he knew something; as to *how much* of either he may have known, it affords us scarce a ray of light, inasmuch as it is impossible for us even to guess at the amount of classical attainment sufficient, in the eyes of a scholar, and something of a pedant, like Jonson, to entitle a man to the praise of having *much* Latin and Greek. What Ben might contemptuously style "small Latin" was, in all probability, as it seems to us, a fair working allowance of it.

Meantime, misfortune had overtaken, and more and more come to press heavily on John Shakespeare; in consequence of which, William, now somewhat over 14, was withdrawn from school, and set to do something for his living. How he was employed from this time till his departure for London, it is impossible to make out with distinctness. One tradition informs us that, for a time, he served as apprentice to a butcher; and it is said that "when he killed a calf," the poetry of his nature prompted him to ennoble the operation as he could to himself, by "doing it in a high style, and making a speech." Unhappily, none of his speeches have come down to us, so that rather more of a mythical atmosphere than might be wished surrounds this pursuit of the ideal under difficulties. But that he was for some time a butcher's assistant, is as likely to be true as not. Another story has it, that for some years he was a school-master; whether or not in birching his boys he dignified the act as in the calf's case, tradition has omitted to inform us. Both stories are not unlikely to be true; the fact of the matter probably was, that in those years young Shakespeare lived miscellaneous as he could. Out of the cloud of uncertainty which shrouds this period of his life, two facts, however, emerge as beyond question—his marriage, and the birth of his eldest born. As soon as may be after Nov. 28, 1582—on which day the license was procured at Worcester—Shakespeare, a lively lad going 19, was married to Anne Hathaway of Shottery, a hamlet some mile or so out of Stratford, a damsel about eight years older than himself; and six months afterward a daughter was born to him, whose baptism bears record May 26, 1583. The obvious inference from this promptitude on the part of his spouse certain of his admirers have sought to evade. It is said, and we believe it is certain, that a mere betrothal before witnesses, to be followed within some reasonable undefined period by the religious ceremony, was then and there held to constitute a valid marriage; and this, it is conjectured, may in Shakespeare's case have prefaced the more formal sanction. And of course it may; the license of conjecture is unlimited; and all to whose comfort in admiring a great genius it is essential to regard him at every point of his career as also a pattern of everything that is proper, must of course be made welcome to this one. The only other children born of the marriage were twins, a boy and a girl, baptized Feb. 2, 1585. The boy (Hamnet) did not survive his father, dying in his 12th year.

As nearly as can be made out, in the year 1586, Shakespeare, then 22, left the neighborhood of Stratford, and betook himself to London. A local tradition assigns as his reason for doing so a mishap which befell him, and a little imprudence consequent on it. The future poet, it is said, while out on a nocturnal poaching expedition in the deer-park of a neighboring magnate, sir Thomas Lucy of Charlecote, was caught by the keepers, kept for the night a prisoner, and arraigned before sir Thomas—a justice of peace—in the morning. What passed is not recorded; but—as the old rumor goes—whatever it was, it excited the ire of Shakespeare, who avenged himself, as a bard naturally might, by circulating "a bitter ballad" in which the good knight was satirized. A further prosecution was for this irreverence directed against him, to escape which it was that he is said to have fled to London. No anecdote concerning Shakespeare has been more widely accepted than this, or, on the whole, seems better to deserve acceptance. An obvious allusion to the Lucies of Charlecote in the *Merry Wives of Windsor*, which identifies their coat of arms with that of justice Shallow, would of itself afford strong confirmation of it. Further, Oldys, an antiquary who died in 1761, and had busied himself much about materials for a life of Shakespeare, certifies the story on something like fair evidence, and gives the first verse of the obnoxious pasquinade, as remembered in the district. It is more coarse and scurrilous than witty; but inasmuch as it would be easy to adduce passages from the admitted writings of Shakespeare in which the coarseness to at least an equal extent preponderates over the wit, this will scarcely of itself amount to proof that he could not possibly have been its perpetrator. The indisposition which more lately has been shown to attach any credit to the tale, seems to rest entirely on a foolish horror of admitting anything as possible in the conduct of the poet which might any way seem to conflict with the reverence now universally accorded to his genius.

No certain details have come down to us as to Shakespeare's earlier relations with the London theater. According to one tradition, he was content at first to turn a penny by holding horses at the door. According to another—which seems in a natural sequence with the foregoing—we find him admitted inside on his promotion, though as yet only in the humble capacity of prompter's attendant. What is certain in the matter is this, that if at any time he was thus meanly occupied, it could have been only for a brief period, as very speedily we have note of him as a man of some importance, at once

dramatist, actor, and shareholder in the Blackfriars theater. As an actor—though we find one contemporary allusion to him as “excellent in the quality he professes”—he seems at no time to have shone especially, being rather respectable than eminent. As dramatist, his magnificent powers were at once recognized, and in no long time had won for him the very foremost rank among the writers for the stage of his time. The extraordinary rapidity of his rise is shown in this indubitable reference to him in Spenser's *Tears of the Muses*, published as early as 1591, only some five years after Shakespeare's arrival in London:

And he, the man whom Nature's self had made
To mock herself, and truth to imitate,
With kindly counter under mimic shade,
Our pleasant Willy, ah, is dead of late.

The reference here has indeed been surmised to point at sir Philip Sidney, by Spenser elsewhere alluded to under the figure of Willy a shepherd; but the surmise is, on various grounds inadmissible. The first two lines have the closest critical pertinence to the character of Shakespeare's genius; as applied to that of Sidney, they are, by comparison, vague and unmeaning. Further, the “mimic shade” in the third line, together with the whole context of the passage, makes it certain a dramatic writer is alluded to; and this Sidney was not. Moreover, the stanza which follows, wherein of “that same gentle spirit” it is said that he

Doth rather choose to sit in idle cell,
Than so himself to mockery to sell,

must needs be held to indicate a man at the time living; and Sidney had died in 1586. The “Ah, is dead of late!” which, literally taken, would suit Sidney, and not Shakespeare, must, in the light of the succeeding couplet, be interpreted as referring to some temporary remission on the part of the latter of his wonted dramatic productiveness; and this, if not otherwise to be accounted for, we might explain by supposing him at this time engaged on his two elaborate poems, *Venus and Adonis*, and *The Rape of Lucrece*, published not long afterward. The year after (1592), we find a contemporary and brother dramatist, Henry Chettle, making the *amende* to Shakespeare for an offense given, in terms most respectfully appreciatory of his excellences at once as a man and an author; and in 1598, Francis Meres, in his *Wit's Treasury*, writes of him as admittedly the “most excellent among the English for both kinds of tragedy and comedy.” We have ample evidence besides of the unrivaled acceptance his works obtained from all classes; not only were they in the wider sense popular, but they brought him special marks of favor and approval from queen Elizabeth and her successor, James—who is said to have honored the poet with an “amicable letter” from his own hand—and procured him the patronage and friendship of some of the most accomplished men of rank of the time, more notably, Henry Wriothesley, earl of Southampton, to whom he dedicated his *Venus and Adonis*, and *Rape of Lucrece*; and William Herbert, earl of Pembroke, commonly held to be the “Mr. W. H.” to whom, as their “only begetter,” his *Sonnets* are addressed.

Shakespeare was plainly—as men of consummate genius mostly are—a man of shrewd solid business ability; and throughout, his material prosperity kept pace with the growth of his poetical reputation. He became early, as we saw, a considerable shareholder in the Blackfriars theater. In the Globe, subsequently erected, he was also a part proprietor. To both he contributed dramas, and from his gains in the triple capacity of actor, author, and sharer of the general profits, he rapidly amassed a fortune. His local attachments were strong, and it seems to have become, as his wealth increased, one main object of his ambition to settle himself as a substantial country gentleman in his native district, to which annually he made a visit. We find him, with this view, from time to time making purchases there of house and landed property. By and by, his visits to Stratford became more and more frequent; and it is positively certain that previous to the year 1613, he had ceased to reside in London, and finally established himself at Stratford. Of his last years there spent, further than that they lapsed peacefully in honor, and the exercise of a liberal and kindly hospitality, nearly nothing is known. There is evidence of his having more or less occupied himself in agricultural pursuits, and good reason to believe that, though withdrawn from other active concernment with the stage, he still continued to write for it. His death took place on his 53d birthday, the 23d of April, 1616. In the diary of a Mr. Ward, the vicar of Stratford, writing circa 1660, the cause of it is thus given: “Shakespeare, Drayton, and Ben Jonson had a merry meeting, and, it seems, drank too hard, for Shakespeare died of a fever then contracted;” but that of this drinking the poet's death was a consequence is at best a doubtful inference.

That Shakespeare erred and sinned at times like others, we know from the passionate confessions of his *Sonnets*, in considerable portions of which the self-reference is too plain to be denied; that, whatever his occasional frailties, he was essentially a man of noble and estimable character, there is a complete concurrence of testimony. He was obviously of most kindly and lovable dispositions; his “pleasurable wit and good nature” made him delightful as a companion; and it was as “gentle Will Shakespeare” that he was familiarly known to his contemporaries. In particular, with his associates and rivals in writing for the stage, his relations would seem to have been of the most cordial and

even endearing kind. The gruff Ben Jonson writes of him after his death: "he was honest, and of an open and free nature," assures us that in "his well-turned and true-filed lines" we see but an authentic reflex of his beautiful "mind and manners;" and avers that he "honors his memory only on this side idolatry." As a slight shadow on this pleasing picture, it has been shrewdly surmised that he was not very happy with his wife. Evidence of this has been sought in certain passages in his dramas; but obviously any inference from these is most precarious. The neglect of her in his will, except in one curt clause interlined, dismissing her with a legacy of "his second-best bed," might well seem much more decisive, till Mr. Charles Knight greatly reduced its importance by showing that, the will apart, by the mere operation of the English law, the poet's widow was entitled to *dower*, and thus amply provided for. There is thus (though the query of why *second-best*, if a bed at all was to be left her, may perhaps have a certain pertinence) no very firm basis of proof for the domestic unhappiness of Shakespeare. Still, if anything in his life is certain, it is this, that, spending great part of his time in London, the poet did not find it essential to his felicity there to have the society of his wife; as probably she, on the other hand, though her husband had gone to the metropolis, was content to abide in Stratford, since it seemed to him the desirable arrangement. It is fair, we think, to infer from this that the affection subsisting between the two was a little on the hither side of enthusiasm.

To discourse here at this date of the genius of Shakespeare would be only to promulgate platitudes. The lofty eulogy of Dryden—"He was the man who, of all modern and perhaps ancient poets, had the largest and most comprehensive soul"—has since been generally acquiesced in. As dramatist, he is admittedly in the world without a peer; as poet (abstracting the differential forms), there are but one or two names in literature even to be named beside his; and dismissing his claims in either kind, we have in his works such a treasury of gnomic wisdom on all matters of human concernment as no other writer has ever bequeathed to the world. If we add, that this greatest of writers is one of the most unequal—that his works contain more than might be wished of what, as the product of such a mind, we need not scruple to call rubbish—and that nearly every vice in writing might be illustrated from them almost at will, we say simply what is patent to every reader not blinded by the stupid and mindless idolatry which too often of late in many quarters has displaced a rational admiration.

The only works of Shakespeare certainly published under his own hand were the two poems *Venus and Adonis* and *The Rape of Lucrece*, which appeared in 1593-94 respectively. As was naturally to be looked for in the case of pieces on the stage so popular, certain of his dramas found their way from time to time into print, but no authoritative edition of any of them was issued during his lifetime. The first collected edition of his dramas was issued in 1623, by Heminge and Condell, his friends and co-proprietors in the Blackfriars and Globe theaters. A second edition followed in 1632; a third, in 1664; and a fourth in 1685. In 1709 appeared the edition of Rowe, with a prefatory sketch of the poet's life. Of the "Shakespearian literature" which followed, and the various re-issues of the dramas, with such masses of critical commentary and emendation as no other writer has ever perhaps been made the subject of, it would be hopeless to attempt an account. It must suffice to mention as successive editors Pope, Theobald, sir Thomas Hanmer, Warburton, Capell, Stevens, Malone, and Dr. Johnson, whose elaborate introductory essay—whatever may be thought of the insolence of much of his criticism of the plays in detail—is perhaps on the whole, as an estimate of the genius of the poet, as satisfactory as any that has since been written. Down to our own time, there has been no remission of activity in this field of literary labor. More recently, the intelligent industry of Mr. Charles Knight specially deserves mention; and along with his may be given the names of Mr. Dyce, Mr. John Payne Collier, and Mr. Singer—all of whom have put forth elaborate and valuable editions of the dramas. An important edition was issued from Cambridge in 1863-66, under the superintendence of two gentlemen of unquestioned scholarly competence, W. G. Clark and W. Aldis Wright.

In Germany, Shakespeare has long been thoroughly naturalized; and the German enthusiasm in regard of him is, if possible, even greater than our own. It was the celebrated Lessing who first decisively introduced him to notice in a series of essays, exhibiting the immeasurable superiority of his art to that of the pseudo-classical models of the French stage. Since his time, many of the most gifted of his countrymen have devoted themselves to the work of Shakespearian criticism and elucidation. From Goethe we have some exquisite fragments, most notably the criticism of *Hamlet*, occurring in his *Wilhelm Meister*; and after his, the names of Tieck, A. W. Schlegel (whose *Lectures*, of date 1809-1811, almost constitute an era in this special department of literature), Franz Horn, and Gervinus (an English translation of whose elaborate commentaries has been published), occur as the most illustrious in connection with the present topic. By Tieck and Schlegel together, the work of translation was undertaken; and the result of their joint labors, which takes rank as the standard German Shakespeare, ranks also, in the opinion of competent judges, as a consummate and almost *unique* specimen of excellence in the translator's art. It has not unfrequently been alleged that, till the Germans made the discovery for them, the English people knew nothing of the greatness of Shakespeare. This is on the face of it ridiculous. The single sentence we have cited from Dryden, and the practical acceptance of it implied in the unexampled attention and industry

which never ceased to be directed to the subject, sufficiently of themselves confute so idle a notion. What the Germans really did (and along with their services in the matter, must be included those of our countrymen Coleridge, whose impulse and point of view, at least, if not something considerably more, were derived from German sources) was somewhat to methodize and enlighten for us an admiration never deficient, but always, like Jonson's regard for the memory of his friend, "only on this side idolatry." The old notion of Shakespeare was that of a genius in power and plenitude unrivaled, but licentious in its modes of operation, and more or less chaotic in its results; "wild above rule or art, enormous bliss." The new German criticism exhibited in the chaos the orderly outlines of a world; co-ordinated the confusion under rules till then unsuspected, and showed in what before had seemed irregular exercise of power admitted to be magnificent, obedience not less magnificent to a law of artistic evolution. It made calculable, in a word, the orbit of a luminary which had somewhat uncomfortably seemed to be sweeping at random through space. But the English people did not need it to reveal the luminary to them; throughout and from the first, they had seen and devoutly worshiped it. Also, to a great extent, it is due to the German enthusiasm of exposition, that over the whole continent, and wherever literature is intelligently studied—some little lingering, dying remnant of French prejudice except—the poet *par excellence* of England is now finally enthroned as the poet *par excellence* of our whole modern world and civilization. The bibliography of the subject is enormous. The best of the recent criticisms and editions are those of Dowden, Furnivall, Swinburne, Richard Grant White, and Furness.

SHALE, or **SLATE-CLAY**, an indurated clay, which often forms beds in the coal measures. It is chiefly composed of silica and alumina, in variable proportions, but also frequently contains a considerable amount of carbonate of lime and of oxide of iron. It is of a gray or grayish-black color, or brownish-red when containing much iron. Its structure is more or less slaty. It is soft, and easily reduced to powder. It is used for making slate-pencils. When free from lime and iron, it is reduced to powder, and used for making fire-bricks, for which it affords an excellent material. Shale very often contains a notable quantity of bitumen, and when this is so much the case that the mineral has a shining resinous streak, and crackles and blazes in the fire, emitting a black smoke and a bituminous odor, it is known as *bituminous shale*. This variety sometimes passes on the one hand into common shale, and on the other into coal. Impressions of ferns and other plants are very frequently found in shale.

Slate, Schist, and Shale are names employed to denote those kinds of rock which are laminated or fissile—that is, which possess a structure readily splitting into thin layers. Shale and schist are almost synonymous, although the latter should be restricted to rocks with their layers irregular or foliated. True slate differs from them in not having its lamination produced by bedding. See **SLATE**. Nevertheless, all three names are often applied to the same substance.

Shale varies much in its composition. Clay, sand, lime, bitumen, and other bodies, either singly or any mixture of them, are included under the name, if they form rocks which split into layers in the direction of their bedding; clay, however, being an ingredient in most shales. Strange as it may seem, the line between even coal and some kinds of shale is not well defined; and in the case of the Torbanehill mineral, found near Bathgate, the question by which of the two names it should be called led to a lengthened and costly litigation.

The importance of certain decomposing shales through which sulphuret of iron is disseminated, for the manufacture of alum, has been long known, and the quantity raised for that purpose from the carboniferous beds of Lancashire and Lanarkshire and the lias beds of Yorkshire is very considerable, yielding about 16,000 tons of manufactured alum annually. Shales of a similar kind are worked in France, Germany, and North America.

Bituminous shales—that is, shales more or less rich in carbon and hydrogen—form another class of these bodies which have, in recent years, attracted much notice as sources of oil for illuminating purposes. It is now more than thirty years since a Frenchman, named Du Buisson, introduced a method of distilling certain bituminous shales in France, at a comparatively low temperature, so as to obtain burning-oil and other products. The process was afterward tried in England, being used for a time in distilling a Dorsetshire bituminous shale, sometimes called "Kimmeridge coal." From this mineral a burning oil, a lubricating oil, and a naphtha for dissolving caoutchouc, were obtained. But neither in France nor in England did the attempt to make a profitable manufacture succeed: in the former country the poverty of the shales was the chief drawback; in the latter, the disagreeable smell of the oil, which could not be effectually removed, prevented it from obtaining favor in the market.

On account of these failures the process fell into abeyance, until it was revived again by the success of the well-known patent of Mr. James Young (see **NAPHTHA**), secured in 1850 for the production of paraffine and paraffine oil from coal. With the exception of the solid paraffine, which Mr. Young was the first to obtain on the large scale, and the employment of coal instead of shale, the processes of Du Buisson and Young are essentially the same. This process has created a new and rapidly-increasing branch of industry, paraffine oil and paraffine being economically obtained by it from either coal or shale.

of certain kinds. Those who have paid any attention to the various beds of minerals which go to form what is geologically called the coal measures are aware that it is only the seams of coal, ironstone, fire-clay, sandstone, and limestone which until very lately have been looked upon as of any industrial importance. Interstratified between these and the other minerals of the series are numerous beds of carbonaceous or bituminous shale, until recently considered useless. Many of these shales were found upon trial to yield from 30 to 50 gallons of crude oil per ton; and works—several of them of great size—have accordingly been started in many places over the entire area of the coal formation in Scotland, and also at various localities in England and Wales, for the manufacture of mineral oil, paraffine, etc., from this material.

Owing partly to the comparative cheapness of shale, and partly also to the fact that these products are obtained from it in a state more easily purified than when they are got from coal, the use of the latter as a source of them is now almost entirely given up. In Scotland, where the manufacture of paraffine oil is chiefly carried on, the shales used are called "oil shales," and it is estimated that there are now 800,000 tons of this material annually distilled. Such a quantity yields the following products:

Crude oil.....	25,000 gallons.
Paraffine.....	5,800 tons.
Lubricating oil.....	9,800 "
Sulphate of ammonia.....	2,350 "

In the refining process the crude oil is reduced to about one-half of its bulk before it is fit for burning. Besides the above, there is also a considerable quantity of "coal gas," unavoidably produced, and partly wasted. But for the distance of the oil works, this would be consumed in some of the larger Scottish towns. Shales found in the Lias and some other formations, likewise yield mineral oil.

SHALER, ALEXANDER, b. Conn., 1827; in 1845 entered the New York state militia and at the beginning of the civil war was maj. of the 7th regiment N. G. S. N. Y. In 1861 he became lieut.col of volunteers; he served in the Peninsular campaign, with Pope and McClellan, at Fredericksburg, Marye's heights, Gettysburg, and Rappahannock; was captured in the battle of the Wilderness, and exchanged, Aug. 1864. At the end of the war he received the brevet rank of maj.gen., and from 1867-86 was maj.gen. of the 1st division of the New York state national guard.

SHALER, NATHANIEL SOUTHGATE, b. Ky., 1841; graduate of Lawrence scientific school, Cambridge, 1862; director of the geological survey of the state of Kentucky. professor of paleontology at Harvard university, and assistant at the museum of comparative zoology. He published reports of the Kentucky survey, and has written *A First Book in Geology* (1884), and *The Interpretation of Nature* (1893).

SHALLOON', a light worsted cloth, said to have been first made at Chalons in France, and to have derived its now corrupted name from that place.

SHALLOP (Fr. *chaloupe*), a large, open, old-fashioned boat, carrying two masts, rigged as in a schooner. Its principal use was in the fisheries, but it has now nearly given place to luggers and yawls.

SHALLOT, *Allium Ascalonicum*, a species of *allium* (q.v.), a native of the east, introduced into Europe by the crusaders—from Ascalon, it is said—and much cultivated for its bulbs, which are used like those of the onion, and sometimes for its leaves, which are used like those of the chive. The leaves grow in tufts like those of the chive, but are larger. The shallot is generally propagated by the cloves, which are planted just beneath the surface of the ground, or only partially beneath it, in spring, and the crop is ready for gathering in July or August. The flavor resembles that of garlic, but is much milder. In the vineyards of Italy the shallot is naturalized.

SHAMA'KA, a t. in the government of Transcaucasia, Russia, containing two villages 15 m. apart. The old town was razed to the ground in 1737 by Nâdir Shah, but has been rebuilt, and in 1892 had 22,139 inhabitants. The place is noted for its extensive silk manufactures. Silk-worms are reared, and there are tanneries and dyeworks.

SHAMANISM is the ancient religion of the Tartar, and some of the other Asiatic tribes. It is a belief in sorcery, and a propitiation of evil demons by sacrifices and frantic gestures. The following account of it is extracted from the *Asiatic Journal*. The priests are men or women, married or single. The character is acquired by pretending that the soul of a deceased priest has appeared to the individual in a dream, appointing him or her his successor. If the priests are in function, they wear a long robe of elk-skin, hung with small and large brass and iron bells; moreover, they carry staves carved at the top into the shape of horses' heads, also hung with bells; and with the assistance of these staves they leap to an extraordinary height. The followers of the Shaman religion have neither altars nor idols, but perform their sacrifices in a hut raised on an open space in a forest or on a hill. Nor are there fixed periods for the performance of their ceremonies; births, marriages, and sickness, uncommon appearances in the atmosphere, or public calamities, are generally the occasions which call for them. The animal to be sacrificed

is generally fixed upon by the shaman or the donor; and after the persons uniting in the ceremony have assembled, the shaman enters the hut, chanting certain words, sprinkles on all the sides of the hut, and over the fire, spirits and milk, and then orders the animal to be killed, which is done by its heart being torn out. The skin of the victim is then stripped off, and its flesh, with the exception of a few pieces which are thrown into the fire, is consumed by the persons assembled. See also LAMAISM.

SHAMMAI (not, as has often been done, to be confounded with Sammeas), an eminent doctor of the Jewish law at the time of Herod, head of a most important school, and supreme judge of the sanhedrim (ab-beth-din) during the presidency of Hillel (q. v.), along with whom he is, indeed, generally mentioned, and of whom he was, as it were, the very counterpart. Very little is known of the history of his life. He most probably was born in Palestine, and most energetically participated in all the political and religious complications of the country. There was a harshness and rigidity in his character which contrasts most strikingly with Hillel's proverbial patience. His religious views were painfully strict, and he even tried to extend the rigor which he imposed upon himself, to the youngest children; but the zealotism with which later times have charged him is not his, but his school's, "the House of Shammai," as it was called. This seems, under the adverse circumstances of the commonwealth—sedition within, and the approaching enemy without—to have developed a fanatical zeal that at times surpassed all bounds, and chiefly tended to foster that exceptional exclusiveness which proved both the bane and the saving of Judaism. The discussions of the two rival schools, of which that of Shammai preponderated long after the master's death, turned exclusively upon points of positive law. There is only one curious metaphysical debate recorded, viz., whether, as one school held, "it was better for man to have been created or not;" or, as the other asserted, "it would have been better if he never had been created." Finally, they both agreed in the latter axiom, but with the addition—"but since he is now in this world, let him be careful in his actions. We need hardly point to the strange light which this discussion and final decision throw upon the times of unequaled national misery that begot them.

SHAMMY. See LEATHER.

SHAMO, or **Gobi**, the Chinese and Mongol names respectively for a wide region of steppe and desert in the eastern part of central Asia. It extends from the Thian-Shan mountains to the Kuen-Lun and Nan-Shan mountains, bordering on eastern Turkestan to the w., and occupying great part of the area between 40° and 50° n. lat., and 90° to 120° e. long. The "desert" is by no means sterile throughout. On the n. and on the s. is a wide belt of firm steppe, consisting for the most part of vast green levels covered with abundance of pasture, but broken by numerous ridges of hills. Between these two belts, each at a height of from 4,500 to 5,500 ft. above the sea, lies a depressed tract, not more than 2,500 to 3,000 ft. above sea level, and varying in breadth from 230 to 460 miles. This alone is properly called Shamo, or "sea of sand;" it is a perfect wilderness of sand and stones, and is probably the bed of an ancient sea. The salt sand of which its soil is mainly composed produces nothing but a few scrubby plants. The fauna of the Shamo, even in the wider sense, is limited, including little save hamsters, dziggetais, a few wild sheep, and antelopes. There are no fixed habitations even in the steppe country; the inhabitants, chiefly Mongols, are all nomads. Yet in various places there are traces of ancient cities buried in the shifting sand (see *Ocean Highways* for 1873). The winter here is intensely cold and stormy, and the summer excessively hot. Yet the wandering hordes of Mongols have no difficulty in keeping large herds, which find plenty of rich pasture on the steppes, and even in winter contrive to pick sufficient food from beneath the snow. From want of wood the nomadic tribes have to use dried dung as fuel. Little is known of the Shamo save in the neighborhood of the main tracks across it, of which the chief is from Maimatchin to Peking.

SHAMOKIN, a borough in Northumberland co., Pa.; on the Lehigh Valley, the Northern Central, and the Philadelphia and Reading railroads; 18 m. s.e. of Sunbury, the co. seat. It contains high and graded schools, public school property valued at over \$250,000, national and state banks, electric railroads, electric light plant, waterworks supplied from Shamokin creek, about 20 churches, and a Y. M. C. A. It is in the anthracite coal region, and has several mines, foundries, machine shops, hotels, and daily and weekly newspapers. The borough is situated near the Broad range of mountains, and mines and ships a large quantity of coal annually. Pop. '90, 14,403.

SHAMROCK, a national emblem of Ireland, a leaf with three leaflets, or plant having such leaves, sometimes supposed to be the wood sorrel, but more generally believed to be some species of clover, or perhaps some common plant of some of the nearly allied genera, as the bird's-foot trefoil, or the black medick. It is not improbable that the name has a sort of general reference to plants with trifoliate leaves, and that a more exact determination of the species may be as difficult as the attainment of botanical accuracy in regard to the emblematic thistle of Scotland.

The small-leaved clover (*trifolium repens*) has had a superstitious respect attached to it from early times. According to the elder Pliny no serpent will touch it. It is said

to have been first assumed as the badge of Ireland from the circumstance that St. Patrick made use of it to illustrate the doctrine of the Trinity. See BIRD'S FOOT TREFOIL.

SHAMYL, or **SCHAMYL** (Eng. "Samuel"), the celebrated leader of the independent tribes in the Caucasus, was born 1797, at Aul-Himry, in Daghestan, and belonged to a wealthy Lesghian family of rank. He was one of the zealous disciples of Kasi-Mollah, the great apostle of Muridism, and ably seconded his endeavors to compose the numerous feuds of the various Caucasian tribes and unite them in a bond of antagonism to their common enemy, the heretical Russians. He was one of the foremost in the defense of Himry against the Russians, Oct. 30, 1832, and, after the fall of his chief Kasi-Mollah and most of his adherents, fought his way alone and severely wounded through the besiegers' ranks. After the assassination of Hamzad-Bey, the successor of Kasi-Mollah, in the end of 1834, Shamyl was unanimously elected "inaum," and being absolute temporal and spiritual chief of the tribes who acknowledged his authority, he made numerous changes in the religious creed and political administration for the purpose of more fully concentrating in himself the whole power. These changes were certainly the chief cause of the great successes which subsequently attended the mountaineers, but it is none the less certain that they produced that sudden collapse of the spirit of independence which took place when the great leader was removed. Shamyl's change of military tactics from open warfare to surprises, ambuscades, etc., brought numerous and sometimes great successes to the arms of the mountaineers. Gen. Ivelitch was severely defeated in 1837, the worst reverse the Russians had yet sustained, and his coadjutor Hafi was forced to make a disastrous retreat. They succeeded, however (1839), in hemming Shamyl into Akulgo, in Daghestan, took the fortress by storm, and put every one of the defenders to the sword, in order to be quite certain that Shamyl should not escape. How he did so is not known, his own followers and the Russians believed him to be dead, when, to the joy of the one and the bitter confusion of the other, he suddenly appeared, preaching with more vigor than ever the "holy war against the heretics." In 1843 he conquered all Avares, besieged Mozdok, foiled the Russians in their subsequent campaign, and gained over to his side the Caucasian tribes which had hitherto favored Russia. This accession of power rendered necessary some change in the government; a civil and a criminal code were promulgated, a regular system of taxation established, and Dargo was made the capital of this Caucasian monarchy, the population of which now (1844) exceeded 1,000,000. But the Russians, under prince Woronzoff, having changed their tactics, assailed the country on various points at the same time, and the advance gained was secured by chains of forts. The fortune of war, however, steadily alternated till 1852, when Bariatinsky compelled Shamyl to confine himself to the defensive, and deprived him of his victorious prestige. Some of the tribes now returned under Russian authority, and Shamyl (probably owing to his diminished power and resources) was unable to take advantage of the diversion in his favor afforded by the Crimean war, after the conclusion of which the Russians resumed their attacks with more energy, opened a road over the mountains, thus cutting off one portion of the patriots and compelling their submission. The following year was still more disastrous; 100 villages were destroyed, the inhabitants transplanted to Russian districts, and Shamyl himself defeated, Aug. 11. On April 12, 1859, his chief stronghold, Weden, was taken after a seven weeks' siege, and his authority, except over the small band of followers who still devotedly adhered to him, was wholly destroyed. For several months he was a mere guerrilla chief, hunted from fastness to fastness, till at last (Sept. 6, 1859) he was surprised on the plateau of Gounib, and after a desperate resistance, in which his 400 followers were reduced to 47, he was captured. His wives and treasure were spared to him, and he was sent to St. Petersburg, where he experienced a generous reception from the czar. A few days afterward he was assigned a residence at Kaluga, with a pension of 10,000 rubles. Thence he went in 1870 to Mecca, remaining a parole prisoner of the Russian government; and died at Medina in Mar., 1871, in the 74th year of his age.

SHANGHAI, the most important maritime city of China, situated on the left bank of the Hwangpoo or Woosung river, 12 m. from where it debouches into the southern portion of the mouth of the Yang-tse-Kiang, in lat. 31° 15' n., and long. 121° 29' e. Though it is now one of the first emporiums of commerce in the east, only a quarter of a century ago it was but a third-rate Chinese town. It is a *hien* or *district* city, having a wall 3½ m. in circuit, through which 7 gates open into extensive suburbs. The low alluvial plain on which it is situated is of great extent, and intersected by innumerable creeks, which environ the walls, and permeate the city in various directions. The city consists of two distinct parts. The first is the native Chinese town, with narrow, dirty streets; the second the European and American settlement with wide streets and fine buildings. Conspicuous buildings are the Protestant cathedral, the Roman Catholic cathedral, a massive edifice, and the Baptist chapel. The temples present the same general appearance met within all Chinese cities. Every city has its ching-hwang, or temple of the tutelary gods: that of Shanghai is in a picturesque position on a rocky islet, surrounded by a serpentine sheet of water, which is crossed by zigzag bridges. A little further down the river stand the foreign settlements, English, French, and American. The whole of the mercantile *hongs* are built upon the English concession; while the French concession is

mainly occupied by *go-downs*, wharves, and Chinese houses. The river in front of the Chinese town is thronged with junks, lashed side by side. The reach in front of the foreign settlement was formerly crowded with sailing-vessels; but since the opening of the Suez canal, the steamers of the P. and O. steam navigation company and of private companies have largely taken their place. Lower down are the ship-yards, machine-shops, and dry-docks, which foreign commerce has called into existence; and here the Chinese government has at work an arsenal where war-vessels of the largest tonnage are built and equipped. Under the arrangement by which the foreign custom-house dues are collected by foreigners, facilities have been created for the navigation of the Yang-tse by stationing a light-ship, buoys, and signals, rendering safer the approach to this important mart. One or two light-houses have also been recently erected, giving additional security to vessels entering and leaving the port. There are a chamber of commerce, reading-room, library, and literary institution—nothing being wanting to render the port of Shanghai the metropolis of eastern commerce. The municipal government of the foreign settlement is highly creditable to the mercantile traders. Several gentlemen are elected annually by the land-holders, for the purposes of local government—police, public improvements, and repairs requiring much management, and entailing much expense, the funds for which are obtained by taxation. Shanghai is also the seat of various missions for converting the natives—the schools, dispensaries, and other benevolent objects meeting with generous support from foreign merchants. The products of Shanghai itself are not of much value, but the city is a most important entrepot for goods passing between the n. and s. provinces of China, as well as for the imports and exports from and to foreign countries. It was in the possession of the Tae-ping rebels from 1853 to 1855, and the prosperity both of the native town and the foreign settlements was in peril for a time; but it enormously advanced after their expulsion—the English quarter in particular becoming a refuge for the Chinese from all parts of the province of Kiang-su, which the Tae-pings continued to desolate up to 1862. The trade of the port increased threefold between the years 1860 and 1863; and this increase was due in a great measure to the large and increasing trade from the ports opened on the Yang-tse. Shanghai was connected with Tien-tsin by telegraph in 1881. In 1895 the imports of foreign produce had a value of \$98,639,609 and the exports were valued at \$70,200,338. The articles of import and export are of a most miscellaneous description; the chief articles of import being opium, English cotton and woollen goods, oil, coal, and metals; and of export, tea, cotton, paper, rice, cloth, medicine, sugar, tobacco, wax, wool, silk, etc. Great quantities of the opium imported into Shanghai are re-exported to the other parts of China. The mercantile importance of Shanghai has increased greatly through the opening of the Yang-tse river to commerce. In 1876 the first railway in China was opened from Shanghai to Kangwang, but it has since been bought up by the government and closed. The population is estimated to be 400,000, of whom 2000 are strangers.

SHANNON, the longest of the rivers of Ireland, rises in the Cuilcagh mountains, county of Cavan, and after a course of 254 m. falls into the Atlantic ocean between the headlands of Loop and Kerry Head. It is commonly divided into two portions, the upper Shannon from its source to Limerick, and the lower Shannon from Limerick to the sea, a distance of 56 miles. In its upper course it passes from its source in Cavan to lough Allen in the county of Leitrim; thence through a difficult channel, where the navigation is in part transferred to a canal, to a small extension called Corry lough, and with alternations of river and lake, to lough Forbes, in the county of Longford, on leaving which the river for a time attains an average width of 250 yards as far as Lanesborough. Here it is again merged in a lake called lough Ree, which stretches 10 m. southward to within 2 m. of Athlone. At this point great natural difficulties have been overcome, and the course of the river, by Shannon harbor and Portumna, and through the picturesque lough Derg to Killaloe, has been so deepened and improved that a regular passenger and goods traffic is maintained. From Killaloe to Limerick the navigation, owing to the rapid fall, is again in part transferred to a canal. On approaching Limerick the river divides into two branches, and on the island thus formed stands what is known as the Irish town, in contradistinction to the English town, of Limerick. From the city, where an extensive and commodious range of quays has been built to the sea, the Shannon is navigable to sea-going vessels; and though near the city very shallow at low water, the navigation for the last 40 m. is free at all times of the tide. The entrance between Kerry Head and Loop is 7 m. across. About 10 m. from the entrance the river narrows to about a mile and a half in width. At present, however, the outward navigation commences at Foynes, which is connected by railway with Limerick, and from which steamboats daily ply to Kilrush, Tarbert, and the intermediate stations. Several rivers of considerable size fall into the Shannon during its course, as the Suck, the Brosna, the Fergus, the Maigue, and the Feale. The improvement of the Shannon was commenced under the Irish parliament. In 1837 the work was placed under a board of commissioners, by whom a sum of more than half a million was expended. It has since been transferred to the board of works or local government board. The navigation is open from the head of lough Allen to Limerick, a distance of 143 m. in a direct course, but by the addition of the Boyle branch of 9 m., and the Strokestown branch of 6 m., a total length of river and canal navigation of 158 m. is now open, over 129 m. of which

large river steamers freely ply. This important system of navigation, which occupies a position almost midway between the e. and w. coasts of Ireland, is connected with Dublin by means of the Grand and Royal canals.

SHANNON, a co. in s. western S. Dakota; formed 1875. Area, 1080 sq. m.

SHANNON, a co. in s. Missouri, drained by the Current river and Jack's fork; about 960 sq. m.; pop. '90, 8788, chiefly of American birth. The surface is hilly and heavily wooded. The soil is fertile. The principal productions are hay and corn. Co. seat, Eminence.

SHANNY, a species of acanthopterous fish belonging to the family *blenniidae* or blennies. See **BLENNY**. The shanny is *blennius pholis*. In this species all the rays of the dorsal fin are of nearly equal length except the eleventh and twelfth, which are short. There are 31 dorsal rays, 13 pectoral, 2 ventral, 19 anal, and 11 caudal. The color is very variable, of shades of brown. They are distinguished from other species by the absence of appendages of the head.

SHAN-SI' (West of the Hills), a province of n.w. China, is of rugged surface, and lies on the western limits of the plain. The surface is generally mountainous. It supplies the purest iron ore and the best coal in China, besides cinnabar, copper, marble, and other minerals. Area, 56,268 sq. m. Pop. '82, 12,211,453.

SHAN STATES, a number of tributary states in Indo-China, lying between Munnipur on the w. and Yun-nan on the e., and from the parallel of 24° n. lat. s. to Bangkok and Cambodia. Of these the northern states are tributary to Burmah (q. v.), and the southern to Siam (q. v.). A great portion of the mountainous region of these states is called the Laos country. The Laos races are divided into two curiously distinct subdivisions. The northern race, beyond the northern frontier of Siam, are called *black-bellies*, from the circumstance that they tattoo themselves with figures in ink, printed on their bodies with sharp needle-like points; the southern race, mostly on and within the eastern frontier of Siam and tributary to that kingdom, are called *white-bellies*, and do not tattoo. They are meek, gentle, unwarlike, and superstitious. Their chief employment is agriculture; and the principal crops raised by them are rice, maize, the sweet potato, calabashes, red pepper, melons, and other fruits. They also have a considerable trade in silver, gold-dust, copper, gum, lac, wax, and dye-wood. In religion they are Buddhists.

SHAN-TOONG, a province in n.e. China, on the Yellow sea; 53,762 sq. m.; pop. '82, 36,247,835. The surface is very mountainous and not very fertile. The principal river is the Hoang-Ho, emptying into the gulf of Pe-chi-li; the province is traversed also from s. to n. by the great canal. Many minerals are found, among them coal and gold, but work on them is hindered on account of lack of facilities of transportation. The products are millet, wheat, indigo, silk, and hemp. The chief towns are Tsi-nan, the capital, Yen-chow, Tsing-chow, Sai-chow, and Woo-ting.

SHA PINSHAY, one of the Orkney islands, about 4 m. n.e. of Kirkwall. It is 5 m. long and $4\frac{1}{2}$ m. in extreme breadth. The fine natural harbor of Elwick bay on the s. side is overlooked by a pleasant modern village.

SHARI, (i. e., *river*), the principal feeder of lake Tsad or Tchad (q. v.).

SHARJA, a t., capital of the province of Sharja, Arabia; on the Persian gulf, about 215 m. n.w. of Muscat; pop. estimated at 25,000. The harbor is poor, but the port is the chief import city for Persia. Weaving is the main occupation of the inhabitants, and quantities of the oriental tapestries, cloaks, curtains, carpets, etc., are made. The principal building is the government treasury.

SHARK, *Squalus*, a Linnæan genus of cartilaginous fishes, now forming in Müller's system a suborder of *plagiostomi* (q. v.), and divided into a number of families and many genera. The sharks have generally an elongated form, tapering gradually to the tail, and not much thickened in the middle. The muzzle projects over the mouth; the nostrils are situated on the under-side of the muzzle. The males have claspers. The gill-openings are lateral. There is no cartilage between the snout and the pectoral fin, as in the rays. Some of the sharks are ovoviviparous; others lay eggs, generally a pair at a time, more being produced in succession. The eggs are large in comparison with those of osseous fishes, and are of a square or oblong form, with a tough horny coat, each corner prolonged into a tendril, the tendrils being apparently of use for their entanglement among sea-weeds. These eggs, or at least their empty cases, are very frequently cast up by the waves on the sea-beach, and are popularly known as *sea purses* or *mermaids' purses*. Near the head of the inclosed embryo there is a slit in the case through which water enters for respiration, and there is another at the opposite end, by which it is discharged. The young fish ruptures the case at the head, where it is weaker than at any other part, and on issuing from it, carries a yolk-bag attached to its belly for its nourishment until it is able to seek food. At this stage of its existence, its respiration is also aided by filaments projecting from the gills through the gill-openings, which are absorbed as it grows older. The teeth are generally large, sharp, and formed for cutting, with the edge often serrated; but in the genus *cestracion* (q. v.) the teeth are

pavement-like; and in some genera they are small and numerous. The angel-fish (q. v.) is ranked among the sharks, but differs from the rest in its flattened form. Some of the smaller sharks are popularly known by the names dogfish, hound, tope, etc. In the articles Cestracion, Dogfish, Fox Shark, Hammer-head, Porbeagle, and Tope, some of the shark tribe are noticed. It only remains here to notice a few of the more interesting of those which do not come under any of these heads.

The WHITE SHARK, *Carcharias vulgaris*, is the most dreaded of all the monsters of the deep. The family *carchariidae*, to which it belongs, have two dorsal fins, the first dorsal placed over the space between the pectoral and ventral fins; they have a nictitating membrane; and have no spout-holes. In the genus *carcharias* the snout is flattened. The white shark attains a great size; one has been caught of 37 ft. in length. The body is covered with a hard skin, and is grayish-brown above and whitish below. It is a very rare visitant of the British coasts, if indeed another species has not been mistaken for it; but is found in the Mediterranean, and is plentiful in the seas of many of the warmer parts of the world, often following ships to feed on any animal substance that may be thrown or may fall overboard, and often in its indiscriminate voracity swallowing things which are indigestible. A lady's work-box has been found in a shark's stomach; and the papers of a slave-ship, which had been thrown overboard, in that of another. Human beings are not unfrequently its prey, and a large shark is not only capable of biting off the limb of a man, but of snapping the body in two, and has even been known to swallow a man entire. Its head is large, the mouth large and wide; furnished with a terrible apparatus of teeth, of which there are six rows in the upper jaw and four in the lower; the teeth are triangular, sometimes 2 in. in breadth, sharp-edged, and serrated; when not in use they are laid back in the mouth, nearly flat, but when the shark bites they are brought up—or at least those of the outer rows—by means of muscles with which each tooth is independently provided. The tail, as in all the sharks, is heterocercal, but its lobes are more nearly equal than in most of them. The shark is often captured by sailors, by means of a great hook baited with a piece of meat, and attached to a chain, as the shark's teeth readily bite through any rope. When the shark is hooked and hauled on board, great care is requisite to avoid danger both from the mouth and from the tail, the powerful action of the latter being generally interrupted by a sailor springing forward and cutting it above the fin with a hatchet. A curious method of catching the shark is practiced in the South Sea Islands; a log of wood is set afloat with a strong rope attached to it, at the end of which is a noose, and the sharks gathering about it as if from curiosity, one of them may be expected soon to get its head into the noose, and is at last wearied out by the log. Formidable as the shark is, men have sometimes successfully braved it in its own element, watching its turning—as from the position of its mouth it must do—to seize its prey, and stabbing it in the belly.

The BLUE SHARK, *Carcharias glaucus*, is much smaller than the white shark, seldom exceeding 8 ft. in length. It is also of a more slender form. The upper parts are of a blue color, the belly white. This species is common in the Mediterranean and in the warmer parts of the Atlantic. It is not unfrequent on the south-western coasts of England in summer, apparently coming in pursuit of pichards, and often doing great mischief to the nets and lines of fishermen, its sharp teeth biting through a net or line with the utmost ease.

The BASKING SHARK, *Selache maxima*, belongs to the family *lamnidae*, having two dorsal fins, spout-holes, and no nictitating membrane. The snout of the basking shark is short and blunt; the teeth are small, numerous, conical, and curved backward. The skin is much rougher than in the white shark and blue shark. This species attains a great size, being sometimes 36 ft. long, but it is not so thick in proportion as the white shark. It is of a blackish-brown color, glossed with blue. It does not exhibit a ferocious character, and is supposed to feed on medusae, crustaceans, and the like. It is often seen swimming slowly with its dorsal fin above the surface of the water, whence it has obtained the name of *sail-fish*. It permits itself to be quite closely approached by a boat, but on being struck with a harpoon it plunges suddenly down, and swims off with great rapidity, so that its capture is attended with danger. It is not uncommon on the northern and western coasts of Britain.

The GREENLAND SHARK, *Scyrnus borealis*, is of the family *scymnidae*. It has large spout-holes, two dorsal fins, no anal fin, and no nictitating membrane. It inhabits the northern seas, and is rarely seen so far south as even the northern Scottish islands. It attains a length of 14 feet or more, is thick, and tapers suddenly at the tail; the fins very small; the teeth in both jaws so arranged as to diverge from a center. It bites and annoys whales, but feeds also on small fishes and crustaceans. When a whale has been killed, a shark will often come even whilst men are occupied in cutting off the blubber, and scoop out one great lump after another, and will return to its repast after having been severely wounded.

The rough skin of sharks is employed by joiners for polishing fine-grained wood, and for covering the hilts of swords to make them firmer in the grasp. The flesh is coarse, but is sometimes eaten. The fins abound in gelatine, and are much used by the Chinese for making a rich gelatinous soup. Dried sharks' fins are a considerable article of import into China. The liver yields a large quantity of oil, which is now also, in some

parts of the world, an article of commerce. For the sake of this oil a shark fishery is prosecuted on the coast of Ceylon.

Fossil sharks make their first appearance in the oolitic rocks, from which eight species have been described. They become more numerous in the cretaceous deposits, in which no less than 60 species have been found. In the tertiary strata, their remains are still more abundant. But as the determination of fossil species depends entirely on the teeth, which, with the exception of the spines and vertebrae, are the only portions preserved, it is probable that the species and genera are too greatly multiplied.

SHARKEY, a co. in w. Mississippi; formed 1876; crossed by Deer Creek; having Mississippi river for its w. boundary. Pop. '90, 8882. Area, 425 sq. m. Co. seat, Rolling Fork.

SHARON, a borough in Mercer co., Pa.; on the Shenango river and the Erie, the Lake Shore and Michigan Southern, and the Pennsylvania co.'s railroads; 80 miles n.w. of Pittsburgh. It contains a public high school, Hall institute (Bapt.), public school and institute libraries, Buhl hospital, electric street railroads, electric-light plant, water-works, about 12 churches, national and private banks, several large iron and steel works, steel casting plant, rolling mill, boiler works, tile works, machine shops, and stove works. Pop. '90, 7459.

SHARON WILLIAM, b. (1821) at Smithfield, Ohio; studied law, went into the banking business in Nevada, was trustee of the bank of California in San Francisco, amassed a large fortune in Nevada silver mining; U. S. senator from Nevada, 1875-81. He d. 1885.

SHARON SPRINGS, a village in Schoharie co., N. Y.; on the Delaware and Hudson railroad; 59 miles w. by n. of Albany. It is a noted summer and health resort, with several sulphur, magnesia, and chalybeate springs, and a picturesque waterfall. Pop. '90, 622.

SHARP, a sign # in music, which, when prefixed to a note, elevates it by a semitone. When placed at the beginning of a piece of music, it denotes that all the notes on the line or space on which it is placed, and their octaves above and below, are to be played sharp. A double sharp \times raises a note two semitones.

SHARP, GRANVILLE, 1734-1813; b. England; abandoned the study of law for a place in the ordnance office. He soon became interested in behalf of the slave. West India planters being accustomed, after bringing slaves to England, to carry them back or sell them to others for that destination, great hardship resulted. Sharp rescued several individuals, and in 1772 he obtained the decision of the English judges in the famous case of the negro Somerset, that as soon as a slave sets his foot on English ground he becomes free. From that time he devoted himself to the destruction of slavery and the slave trade, writing and publishing many pamphlets and books. He was chairman of the meeting in 1787 which formed the "association for the abolition of negro slavery;" was one of the founders of the colony of Sierra Leone; opposed imprisonment of seamen, and advocated parliamentary reform.

SHARP, JAMES, Archbishop of St. Andrews, was the son of William Sharp, sheriff-clerk of Banffshire, and was born in the castle of Banff, May, 1618. Educated for the church at the university of Aberdeen, where he attained distinction as a student, and where he is said (on the authority of a tract, entitled *A True and Impartial Account of the Life of the Most Reverend Father in God, Dr. James Sharp, Archbishop of St. Andrews*, published in 1719) to have protested against the "Solemn League and Covenant;" he afterward visited England, and became acquainted with several eminent English divines, such as Hammond, Sanderson, and Taylor. Returning to Scotland, he was appointed a professor of philosophy at St. Andrews, through the influence of the earl of Rothes, and soon after minister of the parish of Crail, an office which he held during the ascendancy of Cromwell. In Aug., 1651, when Monk was reducing Scotland to obedience, he was carried off, along with several other ministers, to England. Sharp quickly regained his liberty, and he possessed, for some years, the confidence of the more moderate party in the church. In 1656 he was chosen by them to plead their cause in London before the protector against the rev. James Guthrie, a leader of the extreme section (the protestors or remonstrators), which he did with so much dexterity that Cromwell is reported to have said: "That gentleman, after the Scotch way, ought to be termed Sharp of that ilk." When the restoration was on the eve of happening, Sharp was appointed by the moderate party to act as its representative in the negotiations opened up with Monk and the king. This is the crucial period of his career, and on the view we take of his motives depends our whole estimate of his character. Was he sincere, or did he mean to betray the church to which he owed allegiance? Presbyterian writers are nearly unanimous in affirming his perfidy, although the evidence is doubtful. Among the first things the Scottish parliament that met Jan. 1, 1661, did, was to repeal or rescind every act passed since 1638, in consequence of which Episcopacy remained the church of Scotland, as "settled by law"—a dishonorable evasion of a promise made by Charles in a letter written to the presbytery of Edinburgh in Aug., 1660. Soon after, at a council held in Whitehall, Sharp was nominated archbishop of St. Andrews, and having gone up to London, he was there formally con-

separated by the bishop of London and three other prelates. His government of the Scottish church was tyrannical and oppressive; and in consequence he became an object of hatred to most of his countrymen. When one Mitchell, a conventicle preacher, fired a pistol at him in the streets of Edinburgh, the populace allowed the intending assassin to walk quietly off, without making a single effort to arrest him. Finally Sharp was assassinated on Magus Moor, near St. Andrews, May 3, 1679, by a band of fanatical covenanters. In defense of Sharp, the utmost that can be said is that he was simply an ambitious ecclesiastic (of plausible and courtly manners), who had no belief in the "divine right" of presbytery, and who thought that if England were resolved to remain Episcopalian, it would be very much better if Scotland were to adopt the same form of church government, and that if there must be an archbishop of St. Andrews, there was no reason why he should not be the person.

SHARP, JOHN, D.D., 1644-1714; b. England; graduated at Cambridge in 1660; ordained in 1667; became domestic-chaplain to sir Heneage Finch, attorney-general; archdeacon of Berkshire, 1672; prebendary in the cathedral church of Norwich, 1675; rector of St. Bartholomew, London, 1676; dean of Norwich, 1681; chaplain to Charles II., and court-chaplain at the coronation of James II. in 1688; was suspended by the king for preaching in 1686 against the claim of the Roman Catholic church to be called "the only visible Catholic church;" dean of Canterbury, 1689, and bishop of York, 1691. In 1702 he preached at the coronation of queen Anne, and was made lord-almoner to her majesty. His sermons were published in 7 volumes after his death.

SHARPE, a co. in n.e. Arkansas, having the state line of Missouri for its extreme n. boundary; 570 sq.m.; pop. '90, 10,418, chiefly of American birth, with colored. It is drained by Spring river, and Strawberry creek, tributaries of the Black river. Its surface is hilly, and the soil produces cotton, corn, and oats. Iron, lead, and zinc are found in the high ridges of hills which cross it. Co. seat, Evening Shade.

SHARPE, SAMUEL, an Egyptologist, b. in London in 1799; became a banker, but is known chiefly for his contributions to the study of Hebrew, Egyptian, and Coptic hieroglyphics. He published many books on these subjects, among which are: *Vocabulary of Egyptian Hieroglyphics* (1837); *Egyptian Antiquities in the British Museum Described* (1862); *Inquiry into the Age of the Moabite Stone* (1879); *The Epistle of Barnabas* (1880). He d. 1881.

SHARPS, CHRISTIAN, 1811-74, b. N. J.; became a scientific machinist, and was the inventor of the Sharps rifle for military and sporting uses, and of other improvements in fire-arms. The manufacture of the rifle was begun at Hartford in 1854.

SHARPSBURG, a borough in Allegheny co., Pa.; on the Allegheny river, and the Pittsburg and Western, and the Pennsylvania railroads; 5 miles n.e. of Pittsburg. It has a state bank, several building and loan associations, public and private schools, and weekly newspapers, and contains coal mines, rolling mills, iron furnaces, and foundries. Pop. '90, 4898.

SHASTA, a co. in n. California, having the Shasta mountains of the Coast range for its w. boundary; drained by the headwaters of the Sacramento and Pitt rivers; 3960 sq. m.; pop. '90, 12,133, chiefly of American birth, includ. colored. It is intersected by a division of the Southern Pacific railroad. In the s.e. are Lassen peak, altitude 10,437 ft. above the level of the sea; Magee's peak; and Crater mountain, belonging to the Sierra Nevada range. The climate in the valleys is pleasant. The hills are covered with fir, pine, and redwood, and cottonwood trees grow by the rivers. The soil of the bottom lands is fertile, yielding large crops of barley, wheat, fruit, and dairy products. The vine is largely cultivated, and much wine made. Gold, silver, and copper are mined, and there are underlying strata of granite and limestone. It contains hot springs, and has flour, saw, and quartz mills. Co. seat, Redding.

SHASTRA, or SHÂSTER. See SANSKRIT LITERATURE.

SHAT-EL-ARAB. See EUPHRATES.

SHATTUCK, GEORGE CHEYNE, LL.D., 1783-1854; b. Mass., graduated at Dartmouth college, 1803; became an eminent physician of Boston, president of the Massachusetts medical society, and author of several professional works; built an observatory for Dartmouth college, and contributed liberally to its library; aided largely in the establishment of the Shattuck collegiate boarding-school at Faribault, Minn., under the direction of the Protestant Episcopal church; and at his death left \$60,000 to charitable objects.

SHAVE-GRASS. See EQUSETUM.

SHAW, HENRY W., b. Mass., 1818. When fifteen years old he went to the west and there engaged in farming and as an auctioneer. In 1858 he settled at Poughkeepsie, N. Y., where he died in Dec., 1885. Under the *nom de plume* of "Josh Billings" Shaw printed many popular comic sketches, and collections of proverbs embodying much practical wisdom in quaint speech. He also had some success as a comic lecturer.

SHAW, LEMUEL, LL.D., 1781-1861; b. Mass.; educated at Harvard, and admitted to the bar. He was a member of the state legislature, 1811-16, and again in 1819; of the state constitutional convention in 1820, and of the state senate, 1821-22, 1828, and 1829. He was chief-justice of Massachusetts, 1830-60. He is usually considered the ablest judge that ever sat in a New England court; and his decisions (particularly in the

department of real property) have had much effect on the growth of the law, and are still quoted as authority.

SHAW, ROBERT GOULD, 1776-1853; b. Maine; engaged in business in Boston, and acquired a large fortune. He bequeathed \$10,000 to be accumulated as the "Shaw fund" till it amounts to \$400,000, when, it is to be applied to the endowment of an institution for mariners' children.

SHAW, ROBERT GOULD, 1837-63; b. Boston; grandson of Robert Gould, the philanthropist; graduate of Harvard university, 1860. In the war of the secession he enlisted as a private in the New York 7th regiment April, 1861; transferred in May to the Massachusetts 2d., with the rank of 2d lieutenant; capt. Aug. 10; col. 54th Mass., 1863; commander of the first colored regiment from the north; killed at fort Wagner while gallantly leading his colored troops in the assault.

SHAW, SAMUEL, 1754-94; b. Boston; in early life a clerk, but at the beginning of the revolution became a lieutenant of artillery and served with great credit at Yorktown and elsewhere. After the peace he made a voyage to China, returned and was made first-secretary of the war department. In 1786 he was made consul at Canton. His journal with a memoir by Josiah Quincy was printed, 1847.

SHAW, THOMAS, D.D., 1692-1751; b. England; educated at Queen's college, Oxford. After acting for several years as chaplain to the English factory at Algiers he traveled in northern Africa, Palestine, and Asia Minor, returning to England in 1734. In 1740 he became principal of St. Edmund's hall, Oxford, regius professor of Greek, and vicar of Bramley, Hampshire.

SHAW LEFEVRE, Rt. Hon. GEORGE JOHN, a distinguished English statesman, b. June 12, 1832; graduated from Trinity college, Cambridge, was called to the bar in 1855, contested Winchester in 1859, and was returned M.P. for Reading in 1863, holding his seat until 1885, when defeated by Charles T. Murdock. In 1868 he carried the vote in the House of Commons for arbitration of the Alabama claims. He was secretary of the board of trade under Mr. Bright (1869-71); under-secretary, Home Office (1871); postmaster-general (1883-4); M.P. for Central Bradford (1885-95); and chairman of many important committees in the House of Commons. His publications include: *English and Irish Land Questions*; *Incidents of Coercion*; *Peel and O'Connell*; *Agrarian Tenures*; *English Commons and Forests*.

SHAWANO, a co. in n.e. Wisconsin; drained by Wolf, Oconto, Red, and Embarras rivers; about 1152 sq.m.; pop. '90, 19,236, chiefly of American birth. The surface is mostly woodland. Co. seat, Shawano.

SHAWL-MANUFACTURE. Perhaps no garment is of higher antiquity than the shawl; indeed, its simplicity of form would lead us to infer that it was the earliest in use. But of its manufacture we have no distinct account until the reign of the emperor Jelal-ed-din-Mohammed Akbar, in 1556, when the celebrated Cashmere shawls were among the most important manufactures of the world, and were thought worthy to be minutely described in the *Ayin-i-Akbari*, or the "institutes of the emperor." In that work four distinct classes of shawls, all of goat's wool, are described. The first were of remarkable lightness and softness, and were usually self-colored, and made of the wool undyed; the second were woven of wool in the natural colors—viz., white, black, and gray—these were probably arranged so as to form a plaid pattern similar to the shepherd's plaid of Scotland, which is of oriental origin; the third were called *gold-leaved*, probably from being embroidered with that material; and the fourth were long shawl-pieces large enough to inwrap the whole body. So carefully was this manufacture fostered that it received the chief attention of the emperor, and every shawl manufactured was carefully described and registered, and the number of manufacturers was so great that in Lahore alone it is stated there were upward of 1000. The manufacture, in later times, passed through many vicissitudes, and during last century it declined greatly; but in 1809 it had again risen, and there were then about 16,000 looms at work. The true Cashmere shawls are woven in many pieces, and joined together with great artistic skill; those of Britain and France are, however, woven in one piece, the loom being worked by hand, and of course furnished with a Jacquard machine for the production of the pattern. Besides the Cashmere shawls and their European imitations there is an infinite variety of shawls made of various materials—as silk plain, embroidered, and in the form of crape; thread, cotton, and silk lace, and wool.

SHAWNEE, a co. in n.e. Kansas, traversed by the Kansas river; 558 sq.m.; pop. '90, 49,172, chiefly of American birth, inclu. colored. It is drained by the Wakarusa river, and Soldier and Cross creeks. It is intersected by the Union Pacific, the Atchison, Topeka, and Santa Fé, and several other railroads. Co. seat, Topeka.

SHAWNEES. The name of a tribe belonging to the Algonquin family, which extended about the middle of the 17th c. from lake Erie s. as far as Florida, and a portion of which was in Pennsylvania at the time of the Penn settlement. In Carolina they were known as the Savannahs, or Semassees. Early in the 18th c. they allied themselves with the French, though formerly friendly with the English, and assisted them in the war with the latter. In 1758, however, they renewed their friendship with the English, and were engaged in opposition to the Virginians in 1774, who, however, defeated them. After the peace of 1786, being still influenced by the English, they took

part in the Miami war, fought Harmar and St. Clair, and were finally reduced by Gen. Wayne, and made peace in 1795. They were now located on the Scioto, though a portion of them were in Missouri on lands obtained from the Spaniards. During the war of 1812 some of them were again won over by the English, and joined with Tecumseh in endeavoring to bring about a general Indian uprising against the Americans. The number of the Shawnees is about 800, on agencies in Indian territory.

SHAYSS REBELLION, under the leadership of Daniel Shays, in w. Massachusetts in 1786-87, involving nearly 2,000 men on the side of the insurgents. The outbreak was occasioned by general popular dissatisfaction at the pressure of taxation, the burdensome salaries of state officials, and the scarcity of money at the close of the revolutionary war. A paper currency issue was demanded, riotous action took place in several counties, and Shays himself, with a considerable body of followers, endeavored to gain possession of the arsenal at Springfield, but was driven off by the militia and a force under command of Gen. Lincoln. Of 150 who were captured, 14 were tried and sentenced to death, but afterward pardoned. Shays was also pardoned, after being hidden away for a considerable period, and retired to Sparta, N. Y., where he died in 1825. He was born in Massachusetts in 1747, was a sergeant at Bunker Hill, and rose to be capt. during the revolution.

SHEA. See **BASSIA**.

SHEA, JOHN D. GILMART, LL.D., b. New York, 1824; educated at the grammar-school of Columbia college, and admitted to the bar, but gave himself chiefly to historical subjects. He produced numerous works, mainly on American history; the most important of which are *The Discovery and Exploration of the Mississippi Valley*; *History of the Catholic Missions among the Indian Tribes of the United States*; *The Fallen Brave*; *Early Voyages up and down the Mississippi*; *The Operations of the French Fleet under Count de Grasse*; *Washington's Private Diary*; translation of Charlevoix's *History of New France*. Dr. S. published Roman Catholic prayer-books and school histories, prepared the *Catholic Almanac*, edited the *Historical Magazine*, and wrote papers for the publications of historical societies. In his department of history he held high rank for accuracy and research. He died in 1892.

SHEAFER, PETER WENRICK, b. Penn., 1819; son of Henry Sheaffer; pursued his early studies at Oxford academy, N. Y. His father introduced the Lykens Valley coal into the market in 1834, and employed him in his mining operations until in 1838 he participated in the first geological survey of Pennsylvania, led by Prof. H. D. Rogers, being especially useful in the vicinity of the Second mountain. In 1848 he took up his residence in Pottsville. He managed the Philadelphia and Reading coal and iron company, and the Girard mines of the city of Philadelphia. He has visited the British provinces and the Deep River coal lands of North Carolina, has given lectures at Lafayette college and other institutions. He was the originator of the first state survey of Pennsylvania in 1849, and the succeeding one in 1873 owed its organization to him.

SHEAFFE, Sir ROGER HALE, 1763-1851; b. Boston; entered the British army in 1778. He served through the war of 1812, commanding the British at the battle of Queenstown after the death of Gen. Brock, and conducting the defense of York (now Toronto). He was made gen. in 1828.

SHEARING-MACHINE, a machine used in the preparation of woven woolen fabrics. See **WOOLEN MANUFACTURES**.

SHEARS of various kinds are among the implements used in gardening. They are scissors on a large scale, variously modified to suit their various purposes, such as pruning trees, hedges, box-edgings, the verges of grass plots, etc. They are often furnished with long wooden handles, and a spring is sometimes fixed between the handles. A kind used for removing small branches of fruit-trees has one blade made to slide along the other while they are brought together, so that it makes a cut as clean and smooth as that of a knife.

SHEAR-STEEL. See **IRON**.

SHEARWATER, *Puffinus*, a genus of *procellariæ* (see **PETREL**), differing from petrels in having the tip of the lower mandible curved downward, and the nostrils opening separately and not by a common tube. The bill is as long as the head, or longer, the upper mandible compressed and curved at the point. The legs are of moderate length, the tarsi compressed, the hind-toe rudimentary. The wings are long and pointed. The shearwaters spend their lives mostly on the ocean, rarely visiting the shore except for the purpose of incubation.—The GREATER, WANDERING, or CINEREOUS SHEARWATER (*P. cinereus* or *major*) is about 18 inches long, the upper parts blackish brown; the throat, breast, and belly gray. Young birds are entirely brown, the upper parts darkest. This species is frequently seen on the s.w. coasts of Britain. It is very abundant on those of Newfoundland.—The MAXX SHEARWATER (*P. Anglorum*) is much more common on the British coasts, and is found also in more northern regions. It is about 14 inches long, grayish black, the neck mottled with gray, the throat and all the under parts white. It breeds on islets, in rabbit-burrows, or in crevices of the rocks.—There are

several other species in warmer climates.—The name shearwater is sometimes also given to the skimmers.

SHEATH-BILL, *Chionis*, a genus of birds of the family *chionidæ*, placed by many naturalists among the *grallæ*, but by others regarded as belonging to the *gallinaceous* order, and ranked by Mr. Swainson among *columbidæ*. The legs are stout and moderately long, the toes much resemble those of the common fowl, but the fore-toes are united at the base. The bill is thick and conical, and the base is covered by a horny sheath, which the bird has the power of raising and depressing. The WHITE SHEATH-BILL (*C. alba*) inhabits the shores of Australia, New Zealand, and neighboring islands, and feeds on mollusks, crustaceans, and whatever animal substance is thrown up by the waves. It is about the size of a partridge.

SHEATHING is a protection for the wooden planking of the immersed portion of a ship from the attacks of the teredo and other worms, mollusks, and marine animals, which, especially in hot climates, adhere to the bottom and eat into the timber, while they retard the vessel's progress. As early as the time of Trajan sheets of lead were used as sheathing. Thin deal boards, about half an inch thick, were in more modern times nailed on and frequently changed; but about the commencement of the present century plates of copper were introduced, which have been found most effectual, though expensive. The gradual oxidation of the copper by the action of the sea-water produces a sort of poison, which prevents any marine animal from adhering, and keeps a clean bottom. The copper, however, slowly wears away in this oxidation, and requires renewing after a few years. To prevent this loss various methods have been devised. Sir H. Davy applied what he called protectors, consisting of pieces of iron and zinc on different parts of the *copper*; the action of the water on the two metals produced a small galvanic current, which prevented the copper from oxidizing; but it became forthwith encased in barnacles and weeds. For ships stationary in harbor, as hulks, ships-in-ordinary, etc., this system of protection answers well; but it fails for sea-going vessels, together with many other protecting mixtures which have been tried, from the fact that in proportion as the copper is saved from oxidation, by so much does it cease to repel the incrustations which always threaten it.

SHEBOYGAN, a co. in e. Wisconsin, on the w. shore of lake Michigan; drained by the Oneon, Mullet, and Sheboygan rivers; traversed by the Wisconsin Central railroad and several branches of the Chicago and Northwestern; about 515 sq. m.; pop. '90, 42,489. Co. seat, Sheboygan.

SHEBOYGAN, city and co. seat of Sheboygan co., Wis.; on lake Michigan at the mouth of the Sheboygan river, and on branches of the Chicago and Northwestern railroad; 52 miles n. of Milwaukee. It contains the Lakeside and St. Nicholas hospitals, an asylum for the chronic insane, a day school for the deaf, home for the friendless, U. S. government building, Fountain, Sheridan, and other parks, soldiers' monument, public library, electric light and street railroad plants, waterworks supplied from lake Michigan, and over 20 churches. The city is particularly noted for its manufacture of chairs, and has also furniture, leather, bicycle, boot and shoe, brick and tile, carriage and wagon, boiler, soap, and stamped steel and cast iron ware works. Pop. '90, 16,359.

SHECH'EM, a city in central Palestine on Mount Ephraim, about 30 m. n. of Jerusalem. It was one of the cities of refuge, and the first capital of the kingdom of Israel. It is called Sychar in the New Testament. After being destroyed in the war with the Romans it was rebuilt in the reign of Vespasian and called Neapolis. On coins still found it is called Flavia Neapolis. Its present name is Nablûs. Pop. about 9000.

SHECHINAH (from *shachan*, to reside, rest), a word used in post-biblical times by the Jews, and adopted by early Christian writers: expressive of the presence of the divine majesty in heaven, among the people of Israel, or in the sanctuary. It is first found used in the Chaldee versions (Targums) as a kind of periphrasis for the person of God, wherever it is mentioned in the Bible as corporeal; thus being a kind of spiritual interpretation of anthropomorphism. The shechinah is not supposed to have dwelt in the second temple, but it is to return with the Messiah. The particular place where the shechinah was supposed to dwell was the "mercy-seat between the cherubim." The cherubim or other angels were always more or less connected with the shechinah itself, as in the phrases "the heavenly hosts," "hosts of saints," etc., accompanying the divine presence. The first mention of the word is found in the Targum Jerushalmi, Gen. iii. 24—"And He expelled Adam, and caused to reside the splendor of his shechinah from the beginning at the e. of the garden of Eden, above the two cherubim." (Second recension: "between the two cherubim.") Another characteristic instance of its use is found in the version of Onkelos, Deut. iii. 24—"Thou art God, Thy divine shechinah is in heaven above, and rules on earth below."

SHEDD, WILLIAM GREENOUGH THAYER, D.D., LL.D., b. Mass., 1820; graduated at the university of Vermont, 1839, and at Andover seminary, 1843; pastor of a Congregational church at Brandon, Vt., 1844-45; professor of English literature in the university of Vermont, 1845-52; of sacred rhetoric and pastoral theology, Auburn seminary (Presbyterian), 1852-53; and of ecclesiastical history, Andover theological seminary, 1851-62:

pastor of the Brick Presbyterian church, New York, 1862-63; professor of biblical literature, Union Seminary (Presbyterian), New York, 1863-74; professor of theology there 1874-91. Among other works he published *System of Rhetoric*; *Philosophy of History*; *Discourses and Essays*; *History of Christian Doctrine*; *Homiletics and Pastoral Theology*; *The Doctrine of Endless Punishment* (1885). As a theologian he was regarded as developing the sterner elements more fully than is common in recent years. Died 1894.

SHEE, Sir MARTIN ARCHER, D.C.L., 1770-1850; b. Dublin. He studied art under F. R. West in Dublin, and in London under sir Joshua Reynolds, to whom he was introduced by Edmund Burke. In 1798 he was made an associate of the Royal Art Academy. He became president of the academy in 1830, and in the same year was knighted. He was a portrait painter of great popularity, though inferior in genius to Lawrence. He published, in 1805, *Rhymes on Art*, a poem praised in Byron's *English Bards and Scotch Reviewers*. His tragedy *Alasco*, 1824, refused a license as treasonable, was printed, but has little or no merit.

SHEEP, *Ovis*, a genus of ruminant quadrupeds of the family *capridæ*, so nearly allied to goats that the propriety of generic distinction is very doubtful. They differ from goats in having the outline of the face more or less arched and convex; the horns spiral, sometimes very large in the males—in domestication, however, often wanting in the females, and also in the males of some breeds; the chin destitute of a beard; a sac or pit between the toes of each foot, lined with hair, and secreting a fatty matter. It is supposed by some that all the wild sheep existing in different parts of the world are mere varieties of one species, but of this there is no sufficient proof, nor is there anything more than unsupported conjecture in any of the opinions advanced concerning the origin of the domestic sheep, such, for example, as that which refers it to the moufflon, or that which ascribes different domesticated breeds to different wild originals, as the moufflon and the argali (q.v.).

All the wild sheep known are natives either of mountainous regions or of dry and elevated table-lands. They are gregarious, a character which the domesticated sheep fully retains. They are generally seen in small flocks, and are not easily approached, taking refuge in flight, a sharp whistling sound, emitted by one of the rams, serving as an alarm to the whole flock; although they are very capable of making a vigorous defense when driven to close combat. A ram of the domestic species is, indeed, able to sustain a conflict with a bull, taking advantage of his far greater agility and butting against his foe with his strongly armed forehead. A ram has been known to throw a bull on the ground at the first onset, and is always ready to defend himself and his companions against a dog. Many rams exhibit great pugnacity. Sheep differ from goats in their mode of fighting. Goats rear themselves on their hind-legs, and throw themselves sideways on their adversary, to bring the points of their horns to bear. Sheep rush straight at each other, a mode which better suits the different style of armature of the head. Rams of the black-faced variety are especially powerful with their heads, and often at the rutting season kill each other. Their naturally strong skull is considerably protected in battle by heavy arched horns. A thorough ram fight is a terrifying sight. The two warriors go backward each some 15 or 20 yards, and then meet each other with great violence, their heads cracking loudly, and their beam-ends rising in response to the collision of heads. Ewes of this breed fight also. Sheep without horns are not so pugnacious as the mountain breeds.

All the wild sheep have short wool, with an outer clothing of long and nearly straight hair. But even the long hair—at least on the moufflon—has the peculiar character of wool, in that roughness of surface which gives it the property of *felting* (see **HAIR** and **FELT**). One effect of domestication in the common sheep has been to cause the disappearance of the outer long hair, and to produce instead an increase of the length and abundance of the wool, an object of great importance to the sheep-farmer. In neglected breeds of the common sheep the two kinds of hair or wool are very apparent. In some tropical climates the sheep loses its abundant fleece, and is covered with hair little longer than that of the ox.

Although not equal to goats in their adaptation to rocky steeps, and not endowed with such power of leaping from crag to crag, most breeds of sheep exhibit a strong disposition to seek their food in places where no animal not very agile and sure-footed could venture; and those of the domesticated breeds which retain much of their original wildness are thus adapted to situations in which otherwise the pasture would be of little value to man. Every one who has seen the lambs frisking on a Highland hill, in a fine evening, must have admired their nimble movements in places where a herd-boy could with difficulty scramble. In fine weather sheep ascend the heights; and in cold and stormy weather they repair to the lower grounds. In modern times it has been customary to remove the large flocks from mountainous regions to lower grounds to pass the winter; and in the fall of the year shepherds have difficulty in preventing the animals from leaving the summer pastures too early if the weather is unfavorable. On the other hand, if fine spring weather sets in before the period of removal from the winter quarters, the flocks keep pressing toward the summering regions. Mountain sheep have favored spots whither they go regularly over night, and the ewes generally have choice localities to which they go to lamb. They get much attached to certain pastures, and

many of them have been known to return stealthily, in the course of a few days, to their native or appreciated pastures, though removed some hundreds of miles.

A very interesting species of the wild sheep is the **ROCKY MOUNTAIN SHEEP**, or **BIG-HORN** (*O. montana*), of North America. It is equal in size to the argali, which it much resembles also in its general appearance, and in the size and curvature of its horns. The horns of the old rams attain so great a size, and are so much curved downward and forward, that they often effectually prevent the animal from feeding on level ground. The abode of this species is in the most craggy and inaccessible parts of the Rocky mountains. The flesh is of the very finest quality. The wool is very fine, and fully an inch and a half long; it is completely concealed by long hairs. The general color is brown, paler on the lower parts; the old rams are almost white in spring. The **AOUDAD** (*O. tragelaphus*) is a native of the n. of Africa, inhabiting chiefly the lofty parts of the Atlas mountains. It is sometimes called the bearded argali, although it has no beard on the chin; but the throat, the chest, and the front of the forelegs are remarkably adorned with long shaggy hair. On other parts the hair is comparatively short, with an underclothing of short wool. The color is a uniform reddish-yellow. The tail is longer than in the other wild species, and is terminated by a kind of tuft of long hairs. The horns are not so large as in the other wild species. In size, the aoudad exceeds the moufflon, but is not equal to the argali. The French call it *moufflon a mouchettes*, or ruffled moufflon, from the long hair of its forelegs.

The **COMMON SHEEP** (*O. aries*) was probably the first animal domesticated by man. We are told in the book of Genesis that Abel was "a keeper of sheep," and that he brought an offering unto the Lord "of the firstlings of his flock and of the fat thereof." And from that time until the death of Christ, lambs continued to be the most frequent sacrificial offerings, both among the patriarchs and the Jews. The felting and weaving of wool were unquestionably among the earliest of the arts. The wool was probably at first pulled from the skin, a rude and even cruel practice, which it is said still subsists in some countries, and was not very long ago relinquished in the Orkney islands. We read in Genesis xxxviii. of Judah shearing his sheep, and there is abundance of other evidence that the better mode of obtaining the fleece has been in use from remote antiquity. The leather made of the skin of the sheep is much employed in bookbinding, and for making gloves. In patriarchal times, the milk was much used, as it still is in some countries; it is richer than cow's milk, and the cheese made of it has a sharp taste and strong flavor, which, however, are greatly relished by some. In Britain the milk is now very little used. In some mountainous parts of India the sheep is even used as a beast of burden, carrying loads of from 35 to 40 pounds, over rough tracks, and up steep crags, where almost no other animal could be employed.

Those who watch sheep carefully, or keep them as pets, find them by no means devoid of intelligence. They have, however, a stupid habit of following, without scruple, the leader of the flock; so that, when sheep are being driven across a narrow bridge, or where a fence separates the road from a precipice, if anything occur to deter them from proceeding in the proper path, and one break over the fence or parapet, more of the flock may be expected to follow, as has sometimes happened, to their utter destruction. Sheep very soon come to know the voice of the shepherd, and also the appearance as well as the bark of the shepherd's dog. Though they stand more in awe of the shepherd's voice or commands than of any other human being's, the dogs regularly moving among them fail to keep them in such subjection as strange ones do.

The "rutting" is from September till the middle of December, according to the variety of sheep and the system of feeding. White-faced modern breeds have the tups early among them, and the hill flocks are later. The period of gestation is from 20 to 21 weeks. Ewes occupying sown or low-ground pastures lamb in March, while those not so well provided for—the mountain sheep—do not drop their lambs usually till April. The ancient breeds generally have only one lamb in a season, but modern highly fed varieties frequently have twins, occasionally triplets, but rarely more. Lambs intended to come early into the market are as often as possible dropped in January. Generally lambs are weaned in July and August. Weaning of breeding or store lambs, however, is a feature of modern sheep-farming; at one time it was not uncommon to see several generations persistently following the parent stem. The shearing season ranges from May 1 till the middle of July, according to the description of sheep, the nature of the feeding, etc. Autumn is the most common time for the "dipping," "juicing," or "smearing" of the flocks, to kill vermin, prevent skin disease, and preserve and cultivate the wool crop.

The great object for which the ancient Britons possessed sheep before the Roman invasion was the production of wool. The demand for butcher-meat has now raised the value of mutton and lamb so much that the farmer finds it profitable to devote much of his attention to supply the market with these articles; and those breeds of sheep are reckoned most valuable which are most suitable for this purpose, even although the quality of the wool is inferior. When there was no food for sheep but the natural pasture, the animals could not be fattened for the market except during summer, and not until they had attained an age of three, four, or five years; whereas much of the mutton now consumed is the flesh of sheep not more than two years old, fattening being aided by turnips, mangold, oil-cake, etc.

The young branches of heath, and in lower situations, the shoots of furze, often serve as food for sheep, when the supply of grass fails. Sheep delight in short grass and peculiar herbage of hill pastures and bare downs; and the mutton produced in such pastures, and by the breeds most suitable to them, is of superior quality to that of the large fat sheep fed on richer soils. The latter are also more liable to many diseases, particularly where the ground is at all moist. Aromatic and bitter herbs are particularly relished by sheep.

The breeds of sheep are very numerous, and very different.—The **BLACK-FACED SHEEP** of the Highlands of Scotland and of the north of England is perhaps as near the original type as any existing breed. Both male and female have horns; those of the ram large, with two or more spiral twists, those of the ewe much smaller, and little twisted. The face and legs are not always black. Many are speckled, and some principally white. The black-faced sheep is robust, very active, and hardy; enduring the rigors of a severe winter when sheep of most of the breeds common in Britain would perish. It survives on little food, and shifts admirably for itself in a snow-storm. The small quantity, and even inferior quality, of food with which a black-faced sheep will tide over a snow-storm is most surprising. As an instance of the tenacity of life in black-faced sheep, under certain circumstances, they have been known to be buried five weeks under a snow-wreath and come out alive. It has a bright, quick eye, with an expression very different from that softness which is seen in many of the breeds preferred for lower grounds and better pastures. The wool is long and coarse, and the weight of the fleece from 3 to 4 pounds; but the mutton is of the finest quality; and on this account, and its hardness, this breed is preferred to any other in many mountainous districts and on rough elevated moors.—The **WELSH SHEEP** is much smaller than the black-faced; both sexes horned; the color various; the mutton highly esteemed; the fleece seldom weighs 2 pounds.—A very little larger breed with big bushy tail, hornless, or with short and little twisted horns, has long existed in the Shetland and Orkney islands; its wool affording the material for the manufacture of Shetland hose. The Shetland and Orkney sheep are very hardy, and in winter feed much on seaweed.—Smaller than either of these, and, indeed, remarkably diminutive, is the hornless **BRETON SHEEP**.—The **FOREST SHEEP** of England, so called from being pastured in the royal forests, has now in most places been supplanted by other breeds. They are still to be seen on the barren grounds between the British and Bristol channels; and the mutton is in much request in the London market. The original forest sheep was generally small, with face and legs russet brown or gray, wild, restless, and difficult to fatten, but producing wool of fine quality.—The **DORSET SHEEP** is one of the best of the old English upland breeds. Both sexes have small horns. The wool and mutton are of medium quality; but the ewes are remarkable for their fecundity, and the abundance of their milk; and this breed is valued as affording a supply of early lamb for the London market.—The **RYELAND SHEEP** has long existed in Herefordshire and some neighboring counties of England. It is small, short-limbed, white, hornless; produces excellent mutton; and before the introduction of merino wool, its wool was preferred to every other kind for the manufacture of the finest broadcloths.—The **CHEVIOT SHEEP** has existed from time immemorial on the Cheviot hills, and is now very widely diffused over a considerable part of England and almost all parts of Scotland, being hardy and well adapted for high grounds, although it is inferior in hardness to the black-faced. Cheviots, however, rather excel the black-faced both in size and in the value of the fleece; but require a richer pasture. Ewes are hornless, and the rams almost so. The general figure is longer than that of the black-faced sheep. They are narrow in shape, with slender forequarters and long pricked ears. The color is white, the face and legs occasionally mottled with gray, but generally quite white. The fleece weighs from 3 to 5 pounds. Great attention has for many years been devoted to the improvement of this breed.—The **LEICESTER SHEEP** is another of the most valuable breeds. This breed, as it now exists, is a result of the skill and care of Mr. Bakewell, who, soon after the middle of last century, began to make experiments for the improvement of the old Leicester sheep—a large, coarse-boned sheep, not easily fattened, and with coarse long wool, of which, however, the fleece weighed from 8 to 10 pounds. The new Leicester sheep has wool moderately long, of better quality, the average weight of the fleece being about 7 or 8 pounds, and is easily rendered very fat. It is naturally very broad on the back, with finely arched ribs. The color is white. Both sexes are hornless. The Leicester sheep is now common in all but the mountainous parts of Britain, and other breeds have been improved by crossing with it, particularly various breeds of long-wooled sheep, which have long existed in different parts of England, as those of Lincolnshire, Romney Marsh, etc.—A famous long-wooled breed is that called the **COTSWOLD** or **GLOUCESTER**, the wool of which was in great esteem in the 14th and 15th centuries, bearing a higher price than any other wool. In 1464 Edward IV. sent a present of Cotswold rams to Henry of Castile; and in 1468 a similar present was sent to John of Aragon. The Cotswold breed, however, as it at present exists, has been modified by crossing with the Leicester, and produces shorter wool and better mutton than in former times.—The **SOUTH DOWN SHEEP** has recently been improved with the utmost care. The color is generally white, and the face and legs are generally dun, black, or speckled. Both sexes are hornless. The wool is short, very close, and curled. The south down derives its

origin and name from the chalky *downs* of the south of England; but is now met with throughout England and the south of Scotland. The Shropshire sheep are large, with thick wool something like the south down. They are hornless, and black or dun in the face and legs. They come early to maturity, but are suited only for finer climates and good keep. The Oxford down is a heavy, somewhat soft sheep, without horns, and capable of rapid and great development under good treatment. It is not suited to very cold and exposed situations.

The ICELAND SHEEP is remarkable for very frequently having three, four, or five horns. They are good butchers' animals, being deep and thick in the carcass, though rather short in the quarter. The same peculiarity, or monstrosity, as it may be deemed, is exhibited by the sheep of some of the most northern parts of Russia. The n. of Africa possesses a breed of sheep with legs of great length, pendulous ears, and much arched face; the wool short and curled, except on the neck and shoulders, which have a kind of mane. India has also a hornless breed, with pendulous ears, short tail, and very fine much-curled wool. The BROAD-TAILED or FAT-TAILED SHEEP is found in many parts of Asia, as in Syria, India, and China, also in Barbary, and is now very abundant in the colony of the cape of Good Hope. It is rather of small size, with soft and short wool. Its chief characteristic is the enormous development of the tail, by the accumulation of a mass of fat on each side, so great that the tail has been known to weigh 70 or 80 lbs. The tail is highly esteemed as a delicacy, and to protect it from being injured by dragging on the ground, the shepherd sometimes attaches a board to it, or even a small carriage with wheels. The fat of the tail is often used instead of butter. It is less solid than other fat. The FAT-RUMPED SHEEP of southern Tartary has a similar accumulation of fat on the rump, falling down in two great masses behind, and often entirely concealing the short tail. The ASTRAKHAN or BUCHARIAN SHEEP has the wool twisted in spiral curls, and of very fine quality. The Circassian sheep has a remarkably long tail, covered with fine long wool, which trails on the ground. The WALLACHIAN SHEEP, common in Hungary, as well as in the country from which it derives its name, is distinguished by the magnitude of its horns, and their direction. They make one great spiral turn, and then generally rise up from the head to a great height, twisting round as they rise. The wool is soft, and is concealed by long hair.

Sheep were first introduced into the American colony of Jamestown, Va., in 1609, and into New York and Massachusetts about 1625. Within 40 years the number in the colonies had increased to 3,000. The breeds generally esteemed the best in the United States are the Vermont Brewer and Atwood flocks; though the French, Saxon, and Spanish merinos are favorites with some. The Leicester breed is considered the best for the farmer, being heavy in carcass and full in yield of wool. Southdowns are preferred for their mutton, and the Cotswold is highly considered. The total number of sheep in the United States in 1890 was 44,336,072, according to the report of the secretary of agriculture. The largest number in any one state was 4,752,640 in Texas, and the smallest number, in Rhode Island, 20,231. There were 4,035,120 in Cal.; 3,092,736 in New Mex.; 3,943,589 in Ohio.

SHEEP-LOUSE, or SHEEP-TICK, or (in Scotland) KAID, *Melophagus ovinus*, an insect of the family *hippoboscidae*, to which also the forest-fly belongs, ranked in the order *diptera*, although in this genus the wings are completely wanting. It lives among the wool of sheep, and particularly of lambs, sucking the blood of the animal, and is most abundant in the early part of summer. Where it fixes its head in the skin a large round tumor is formed. Its body is very compressed and smooth, of a rusty color, the head and thorax small, the abdomen large. The female does not lay eggs, but, like the other *hippoboscidae*, hatches the egg and nourishes the larva within her own body, till it passes into the pupa state, when it is deposited, oval-shaped and shining, fastened to the wool of the sheep. Sheep-farmers use various washes or *dips* for the destruction of these creatures, many of which are arsenical. A patent was obtained a few years since for a sheep-dip, of which carbolic acid is a principal ingredient. The sheep-louse is not a tick proper. See TICK.

SHEEPSHEAD BAY, or THE COVE, a village in Kings co., N. Y., on the bay from which it is named, 2 m. n.e. of Coney Island. The Coney Island Jockey Club has a mile track here, with a handsome façade at the entrance, grand-stand, judges' stand, etc., in the "Queen Anne" style, erected 1880. Race meetings are held in June and Sept. There are also a church, cottages and boarding-houses for summer residents.

SHEEP'S-HEAD, *Sargus ovis*, a fish of the family *sparidae*, plentiful in the latter part of summer on some parts of the coast of North America, and highly esteemed for the table. It sometimes attains a weight of 14 or 15 pounds. A very large fish is sometimes sold in the New York market for a price equal to four or five pounds sterling. The fishery is therefore of some importance. Nets are used, and many fish are often taken at a single haul, which are immediately packed in ice for the market. It is difficult to take the sheep's-head with a line, as its cutting teeth snap the line asunder. The genus *sargus* has cutting front teeth, and round teeth in the back of the mouth. *S. rondeletii* inhabits the Mediterranean, and has been esteemed for the table from ancient times. The *sargi* feed on shell-fish and the smaller crustaceans, which they easily crush with their round teeth; partly also on sea-weeds.

SHEERAZ. See SHIRAZ.

SHEERNESS', a seaport and naval arsenal in the co. of Kent, stands on the n.w. extremity of the Isle of Sheppey, at the confluence of the Thames and Medway, 11 m. e.n.e. of Chatham. It consists of four divisions, Blue-Town, Mile-Town, Marine-Town, and Westminster, and of these the first is within the limits of the garrison. The dock-yard, much extended and improved within recent years, is now one of the finest in Europe. It covers 60 acres, comprising wet and dry docks, immense storehouses, official residences, and the naval barracks. The harbor is usually crowded with vessels of all descriptions. It is sheltered, and there is deep water even at low tide. An extensive oyster-fishery is carried on in the vicinity. At Garrison point is the residence of the port-admiral, the telegraph, coast-guard station, and military barracks. The chief trade is in supplying the requirements of the employees in the various government establishments, and in the export of corn, seeds and oysters. The beach and cliffs are a favorite resort for ramblers. Pop. '91, 13,841. Sheerness was captured by the Dutch under De Ruyter in 1667, and here the mutiny of the *Nore* burst forth in 1798.

SHEERS. The elemental form of a pair of sheers consists in two spars fastened together near the top, with a pulley at the point of junction, and held by a rope, fastened to any convenient object, in such a position that the weight lifted hangs nearly between the spars. This forms an easily improvised crane. An apparatus of this kind, of great height and strength, is used for masting vessels. In the principal dock-yards there are tall permanent sheers, mounted either on the side of a masting-dock or on a floating sheer-hulk.

SHEET, on ship-board, is the rope by which each of the lower corners of a square-sail, or the after-corner of a fore-and-aft sail, is held down in order that the sail may be tightened to the wind.

SHEETING, a cloth made of flax or cotton, and used for bed-linen. It is chiefly made in Ireland in or near Belfast, and in Scotland. The term sheeting is also applied to the coarse hempen cloth used for making tarpaulins (q.v.).

SHEFFIELD, a city in Colbert co., Ala.; on the Tennessee river, and the Louisville and Nashville, the Memphis and Charleston, and the Northern Alabama railroads; 124 miles n. w. of Birmingham. It was founded in 1884; contains several large blast furnaces, the main shops of the Memphis and Charleston railroad, cotton compress, and several wood manufacturing plants; and has electric lights, water supply from the river, several churches, and weekly newspapers. Pop. '90, 2731.

SHEFFIELD, a town in Berkshire co., Mass.; on the Housatonic river and the New York, New Haven, and Hartford railroad; 31 miles s. of Pittsfield. It was incorporated in 1733; contains the villages of Sheffield and Ashley Falls; has a high school, free town and Friendly Union libraries, memorial hall, and several churches; and is principally engaged in farming, dairying, and marble and limestone quarrying. Pop. '90, 1954.

SHEFFIELD, a manufacturing t., parliamentary and municipal borough and city; in the West Riding of Yorkshire; it is picturesquely situated on several hills that slope toward the confluence of the rivers Sheaf and Don, 165 m. n.n.w. of London, with which it is connected by the Great Northern and Midland railways, and 41 m. e. of Manchester. Within its limits there are five parliamentary divisions, namely, Attercliffe, Brightside, Hallam, Eccleshall, and Central. The town generally is well built, its appearance having been greatly improved since 1875 by important public works, carried out at great expense. It possesses many fine public buildings, such as the original parish church, supposed to have been erected in the reign of Henry I., 240 ft. long by 130 ft. broad; St. Mary's Catholic church, surmounted by a tower 200 ft. high; the town-hall (erected 1891); cutlers' hall; corn exchange; the new market-hall, or Norfolk market, with a roof of glass and iron, erected by the Duke of Norfolk; music-hall, assembly rooms, theaters, etc. There are extensive botanic gardens, and a fine cemetery about a mile from the town; many churches; numerous educational establishments, such as the free grammar school, the collegiate school, the Wesley college, a Lancasterian and many national schools, free writing-schools, school of art, besides denominational schools, etc.; also a mechanics' institution, established in 1832. The mechanics' library (1828) is now merged into the free library, and there is also the Sheffield library. There are likewise many charitable institutions. As far back as the time of Chaucer, Sheffield was noted for the manufacture of cutlery; and at the present day an endless variety of articles in brass, iron, and steel is produced at the many manufactories with which the town abounds,—such as knives of every description, silver and plated articles, britannia-metal goods, coach-springs, spades, spindles, hammers, files, saws, boilers, stoves, grates, buttons, bicycles, etc. In March, 1864, a new embankment, constructed for the Sheffield water company, at Bradfield, gave way, and let out a body of water 95 ft. high from a reservoir 73 acres in extent. The destruction of life and property by this flood was unprecedented in England: 250 persons perished; mills, houses, and hamlets were swept away from their foundations, and, apart from the ruin of the Bradfield dam, damage was done to private property to the extent of close upon £300,000. In 1866, trade outrages, in the form of "rattening"—a local name for the stealing of tools and wheel-bands—and of unscrupulous treatment of the lives and limbs of non-union men, which had for more than twenty years been a disgrace to Sheffield, were brought to a prompt check by a royal commission, procured, among other influences, by the loyal outspokenness of the local

press. Two fine churches have been recently erected—All Saints, a cruciform, early second pointed edifice, in 1867; and Sharrow church, of the late first French pointed period, in 1868. Since 1871 the introduction of the manufacture of armor-plates, railway-springs, tires, and rails have given a remarkable impetus to the growth of the town. The Albert hall, erected in 1873, is a commodious building which seats 3000 people. Five members are returned to parliament. Pop. '94, 338,316.

SHEFFIELD, JOSEPH EARLE, 1793-1882; b. Southport, Conn.; d. New Haven. When fifteen years old he entered commercial life at Newberne, N. C.; he afterwards removed to Mobile, Ala., and became one of the largest cotton shippers in the country. He returned to Conn., 1835, and became largely interested in railroad operations. For many years he was pres. of the New Haven and Northampton railroad. He gave upward of \$700,000 to educational purposes, and founded the Sheffield scientific school at Yale.

SHEFFIELD SCIENTIFIC SCHOOL. See YALE UNIVERSITY.

SHEFFORD, a co. in s.w. Quebec, intersected in the s. by the Stanstead, Shefford and Chambly and the Canadian Pacific railroads; 555 sq. m.; pop. '91, 23,263. It is drained by the Yamaska river in the s.e., and the Black river in the north. Co. seat, Waterloo.

SHEIK (Arab. elder, aged person), a title of reverence, applied chiefly to a learned man, or a reputed saint, but also used sometimes as an ordinary title of respect, like the European Mr., Herr, etc., before the name. It is, however, only given to a Moslem. The sheik Al-Islam is the chief mufti (q.v.) of Mohammedanism at Constantinople; a title supposed to have been first assumed by Mohammed II. at his conquest of Constantinople in 1453, when this place became the seat of his empire. The sheik of Mecca, by virtue of his supposed descent from the prophet, levies a kind of tribute on all the pilgrims to the Kaaba. The term is also applied to heads of Mohammedan monasteries (our abbot or prior), and to the higher order of religious preachers. Sheik Al-Gebal (ancient of the mountain) is the name of the prince of the assassins (q.v.), or those Ismaelites of Irak, who undertook to assassinate all those whom their chief would pronounce to be his enemies.

SHEIL, RICHARD LALOR, 1791-1851; b. Waterford, Ireland; graduated at Trinity college, Dublin; studied law and was called to the bar in 1814. For eight years he occupied himself chiefly in writing several successful dramas, of which *The Huguenot* was the best and the least popular. In 1822 was printed the first of his *Sketches of the Irish Bar*, a keen and witty picture of the life and manners of the time, published collectively in 1855. The same year he joined the "Catholic association," and in 1825 was sent to oppose its suppression as joint advocate with Daniel O'Connell before parliament. He soon became known as a political agitator and brilliant orator; was elected to parliament in 1829; aided O'Connell in the repeal agitation, but, changing his position, took office under the Melbourne ministry, and in 1850 was sent to the Tuscan court as British ambassador.

SHEK'EL (*sheklos*, from *shakal*, to weigh) originally a certain standard weight in use among the ancient Hebrews, by which the value of metals, metal vessels, and other things was fixed. Gradually it became a normal piece of money, both in gold and silver, marked in some way or other as a coin, although not stamped. The gifts to the sanctuary, the fines, the taxes, the prices of merchandise, are all reckoned in the Old Testament by the shekel, not counted but weighed. Three different kinds of gold, silver, and copper shekels are mentioned: the common shekel, the shekel of the sanctuary (probably of double value), and the shekel of royal weight. Besides these, there was a half-shekel (*beka*), and a fourth shekel. The sacred shekel was equal to 20 geras (beans), and 3,000 sacred shekels made a talent. The gold shekel is reckoned approximatively to contain 161 Troy grains, the silver shekel 275. During the Babylonian exile, the Persian money (*dariks*) was used by the captives; nor do they seem to have afterward used any but the coin of their foreign rulers. It was first under the Maccabæans that national money began to be struck, adorned with sacred emblems, and with inscriptions in the native language and characters. De Sauley alone assumes, without much show of reason, Jewish coins to have existed from the time of Alexander the great. Simon, the "prince and high-priest," received, according to 1 Macc. xv. 16, the permission from Antiochus VII. to strike coin in 138 B.C. The emblems are sacred branches, sheaves, flowers, vases, etc., and the legend (in a peculiarly archaic ["Samaritan"] alphabet) contains the date, the name of the Jewish ruler, and the inscriptions "Shekel of Israel," "Jerusalem the Holy," "Redemption of Israel." The latest coins with Hebrew inscriptions date from the revolution of Bar Cochba under Hadrian. The value of the silver shekel is reckoned to be something over two shillings.

SHEKINAH. See SHECHINAH.

SHELBURNE, a co. in s.w. Nova Scotia, having the Atlantic ocean for its s. and s.w. boundary; 945 sq. m.; pop. '91, 14,956. It is drained by the Clyde, the Jordan, and other rivers. The surface is level. Co. seat, Shelburne.

SHELBURNE, WILLIAM PETTY FITZ-MAURICE, Earl of, son of the first earl, and descendant of sir W. Petty, founder of the science of political arithmetic, was b. May, 1737, and commenced his political career in 1761 by entering the house of commons as member

for Wycombe, but only sat for a few weeks, the death of his father having called him to the house of lords. When Mr. G. Grenville succeeded Bute in 1763, Shelburne, whose talents had made him remarked, although only 26, was placed at the head of the board of trade. When Chatham formed his second administration in 1766, he made Shelburne one of the secretaries of state, although not yet thirty. Upon the fall of lord North's ministry in 1782, George III. sent for Shelburne, and proposed to him to form a government. He declined, not being the head of a party, and was sent by the king to the marquis of Rockingham with an offer of the treasury, himself to be one of the secretaries of state. According to earl Russell, in his *Life of C. J. Fox*, it soon appeared that Shelburne was not so much the colleague as the rival of lord Rockingham, the chosen minister of the court, and the head of a separate party in the cabinet. Upon the death of Rockingham in 1782, the king sent at once for Shelburne, and offered him the treasury, which he accepted without consulting his colleagues. Fox thereupon resigned, and Shelburne introduced William Pitt, then only 23, into office as his chancellor of the exchequer. Shelburne's ministry, on the occasion of the king's announcement of his determination to concede the independence of the American colonies, found itself outvoted by the coalition between Fox and lord North. He resigned, and the coalition ministry took his place, but soon broke up. The nation expected that the king on this event would send for Shelburne, but William Pitt received the splendid prize, and Shelburne was consoled by the coronet of a marquis (of Lansdowne). During the latter years of his life his health was delicate, and he withdrew from public life; but he came forward as a strong supporter of the union with Ireland. He indulged his tastes in the adornment of Lansdowne house. Here he collected a splendid gallery of ancient and modern pictures, together with a library of 10,000 volumes, comprising the largest collection of pamphlets and memoirs on English history and politics possessed by any man of his time, as well as a series of MSS., which were sold to the British museum for £5,000. He was a discerning patron of genius. It was while he resided in Lansdowne house as the librarian and friend of Shelburne that Priestley made the discovery of oxygen. Jeremy Bentham was one of his most intimate friends. Shelburne was the patron and friend of sir S. Romilly, and twice offered him a seat in parliament. He was also on terms of intimacy with Mirabeau, Dumont, and other foreigners of literary and political distinction. He died in May, 1805. See *Life of Shelburne*, by lord Edmond Fitzmaurice (London, 1875-76).

SHELBY, a co. in central Alabama, having the Coosa river for its e. boundary; 772 sq. m.; pop. '90, 20,886, chiefly of American birth, inclu. colored. It is intersected by branches of the Louisville and Nashville and the Southern railroads. It is drained on the n.w. by the Cahawba river. Its surface is varied by hill and valley, well wooded with forests of oak, pine and hickory. Its mineral products are coal and iron ore. Its agricultural products are grain, sweet potatoes, cotton, tobacco, and live stock. Its manufactures are cotton, thread, pig and cast iron, and lime. Co. seat, Columbiana.

SHELBY, a co. in s. central Illinois; drained by the Kaskaskia, Little Wabash, and Sangamon rivers; traversed by the Cleveland, Cincinnati, Chicago, and St. Louis, the Baltimore and Ohio Southwestern, the Illinois Central, and other railroads; 776 sq. m.; pop. '90, 31,191, chiefly of American birth. Surface partly prairie and partly forest; wheat, oats, corn, hay, sorghum, and pork are the staples; there are 6 carriage factories, 2 brick yards, and many flour and saw mills. Co. seat, Shelbyville.

SHELBY, a co. in s.e. central Indiana; watered by Blue river and Sugar and Flat-rock creeks; crossed by the Cleveland, Cincinnati, Chicago, and St. Louis, the Pittsburg, Cincinnati, Chicago, and St. Louis, and the Cincinnati, Hamilton and Dayton railroads; about 400 sq. m.; pop. '90, 25,454, chiefly of American birth. The surface is mostly prairie or woodland. The soil is fertile. The principal productions are corn, wheat, oats, and cattle. Co. seat, Shelbyville.

SHELBY, a co. in w. Iowa, drained by the Nishnabotona river and Boyer and Mosquito creeks; 576 sq. m.; pop. '90, 17,611, chiefly of American birth, with colored. The Chicago, Rock Island and Pacific railroad crosses the extreme s.w. portion. Its surface is varied by rolling prairies, furnishing excellent pasturage and long stretches of woodland. The soil is fertile, producing maize, wheat, and oats. Live stock is extensively raised. Co. seat, Harlan.

SHELBY, a co. in n. Kentucky, watered by branches of the Kentucky river; on the Louisville and Nashville, the Chesapeake and Ohio, and the Southern railroads; about 405 sq. m.; pop. '90, 16,521, includ. colored. The surface is rolling and heavily wooded. The soil is fertile. The principal productions are corn, wheat, oats, and cattle. Co. seat, Shelbyville.

SHELBY, a co. in n.e. Missouri; drained by the n. fork of Salt river, by North Two river, and the South Fabius river; 514 sq. m.; pop. '90, 15,642, chiefly of American birth, with colored. It is intersected in the s. by the Hannibal and St. Joseph railroad. Its surface is undulating and thinly timbered. The soil is fertile, producing corn, oats, sorghum, and live stock. Its mineral products are limestone and bituminous coal. Co. seat, Shelbyville.

SHELBY, a co. in w. Ohio; drained by the Miami river and Loramie's creek; traversed by the Cleveland, Cincinnati, Chicago, and St. Louis, and the Cincinnati, Hamilton and Dayton railroads, and by the Miami canal; 420 sq. m.; pop. '90, 24,707, chiefly of American birth, with colored. Surface, rolling and productive; corn, oats, wheat, hay, and pork are the staples. Co. seat, Sidney.

SHELBY, a co. in s.w. Tennessee, adjoining Mississippi; bounded on the w. by the Mississippi river; drained by Wolf river and Elk creek; crossed by the Illinois Central, the Little Rock and Memphis, the Louisville and Nashville, the Kansas City, Fort Scott, and Memphis, and several other railroads; about 728 sq. m.; pop. '90, 112,740, chiefly of American birth, with colored. The surface is level and heavily timbered. The soil is fertile. It is the largest cotton-growing county in the state. Co. seat, Memphis.

SHELBY, a co. in e. Texas, having the Sabine river for its e. boundary, separating it from the state of Louisiana; 800 sq.m.; pop. '90, 14,365, chiefly of American birth, inclu. colored. It is drained by the Attoyac river, which forms part of its w. boundary. Its surface is rolling and largely covered with forests. Co. seat, Centre.

SHELBY, ISAAC, 1750-1826; b. Md.; was a surveyor in western Virginia; lieutenant at the battle with the Indians at Mount Pleasant, Va., in 1774; capt. of a military company in Virginia in 1776, and in 1777 appointed commissary; was elected to the house of delegates, Virginia, in 1779, and commissioned maj. by Gov. Jefferson, and the following year made col.; fought at the battle of King's Mountain, and in 1780 received for his bravery a vote of thanks and a sword from the legislature of North Carolina, to which he was chosen a member in 1781; settled in Kentucky and was governor, 1792-96, and again, 1812-16. With 4000 Kentuckians he aided Gen. Harrison at the battle of the Thames, and received a gold medal from congress.

SHELBYVILLE, city and co. seat of Shelby co., Ind.; on the Big Blue river and the Cleveland, Cincinnati, Chicago, and St. Louis and the Pittsburg, Cincinnati, Chicago, and St. Louis railroads; 26 miles s.e. of Indianapolis. It is in a fertile agricultural region, and has national banks, daily and weekly newspapers, several churches, saw, planing, and flour mills, manufactories of carriages, furniture, ice, and barrels, and a large general trade. Pop. '90, 5451.

SHELDON, a township in Beaufort co., S. C. Pop. '90, 5979.

SHELDON, GILBERT, D.D., 1598-1677; b. England; graduated at Trinity college, Oxford, 1617; became fellow of All Souls' college in 1622; vicar of Hackney in 1633, and rector of Ickford and Newington; was chaplain to Charles I. in 1635; became bishop of London in 1660, archbishop of Canterbury in 1663, and chancellor of Oxford university in 1667.

SHE' LIF, the chief river of Algeria (q.v.).

SHELL. This term is employed to designate the hard outer coverings of a large number of invertebrate animals. Shells are met with in the *echinodermata*, in the great majority of the *mollusca* (excluding the molluscoids), in a few of the *annelida*, as *Serpula*, *Spirorbis*, etc., in the *cirropoda*, and in the *crustacea*. The forms of the different varieties of shells are sufficiently noticed in the articles on the classes of animals to which they respectively belong; and we shall confine our remarks to the intimate structure of shell, which, until the publications of Carpenter, Rainey, and others, during the last quarter of a century, was altogether misunderstood. The doctrine formerly held, and still maintained in many popular hand-books of conchology, was, that shell is not only extravascular (or devoid of vessels), but completely inorganic, being composed of an exudation of calcareous particles (chiefly carbonate of lime) cemented together by a kind of animal glue. It is now known that shell always possesses a more or less distinct organic structure, which in some cases resembles that of the *epidermis* of the higher animals, while in others it approximates to that of the *derma*, or true skin. The nature of the organic structure is so different in the *echinodermata*, *mollusca*, and *crustacea*, that a separate description is required for each, and as Dr. Carpenter remarks: "Even in the subordinate divisions of these groups, very characteristic diversities are frequently observable, so that, as in the case of the teeth, it is often possible to determine the family, sometimes the genus, and occasionally even the species, from the inspection of a minute fragment of a shell, as well fossil as recent."

In the *echinodermata*, the elementary structure of the skeleton exhibits the appearance of a net-work composed of calcareous and animal matter intimately united. The diameter of these apertures or meshes of net-work varies to a certain degree in different parts of the same shell, the openings being larger in the inner than the outer layers, the extremes being $\frac{1}{150}$ and $\frac{1}{250}$ of an inch. The entire shell is made up of an immense number of such plates, which lie parallel to one another, separated by minute vertical pillars.

In the *mollusca*, the shell is formed upon the surface of the mantle, which corresponds to the true skin of other animals. Hence it must be regarded as epidermic. It consists of cells consolidated by a deposit of calcareous salts in their interior, but, as in the case of many other tissues, the original cellular organization often becomes so hidden by subsequent changes, as to cease to be recognizable. The typical condition of the shell in this sub-kingdom is best seen in certain bivalves—the genus *pinna*, for example.

On breaking off a small portion of the projecting margin of one of these shells, and examining it under the microscope, it is found to be made up of a vast number of prisms, hexagonal in form and nearly uniform in size, which are arranged perpendicular to the surface of the lamina of the shell, so that the thickness of the lamina is formed by their length, and its surfaces by their extremities. On submitting such a lamina to the action of a dilute acid, the calcareous salts are dissolved, and a membrane is left which shows the prismatic structure as perfectly as it was seen in the original shell, the hexagonal divisions being evidently the walls of cells resembling those occurring in the pith or bark of a plant. It sometimes happens in recent, but more commonly in fossil shells, that the animal matter decays and leaves the prisms ununited, and easily separable from one another. It is only in a few families of bivalves that the cellular structure is seen in this very distinct form, or that it makes up a large portion of the shell; and these families are closely allied to *pinna*. In many shells the external layer is formed on the above plan, while the internal layer is nacreous; in many, again, the nacre, or "mother of pearl," and in others sub-nacreous structure, constitutes nearly the whole thickness of the shell. The nacre, according to sir D. Brewster, consists of a multitude of layers of carbonate of lime, alternating with animal membrane; and the grooved lines on which iridescent luster depends are due to the wearing away of the edges of the animal laminae, while those composed of carbonate of lime stand out; it is, however, more probable, from Dr. Carpenter's researches, that the peculiar lineation of the surface of nacre is due to the disposition of a single membranous layer in folds or plaits, which lie more or less obliquely to the general surface.

In the *crustacea*, the structure of the shell has only been examined in the order of decapods. In this order—in the common crab, for example—the shell consists of three layers, viz., (1) an external horny epidermic membrane covering the exterior; (2) a cellular or pigmentary structure; and (3) an internal calcareous or tubular substance. The horny layer is easily detached after the shell has been for some time immersed in dilute acid; it is thin and tenacious, and presents no trace of structure. The pigmentary layer is very thin in the crab and lobster, but is much thicker in some other decapods. The internal layer is that which constitutes the chief part of the shell; it is in this layer that the calcareous matter is chiefly deposited; but even after this has been removed, a very distinct animal basis remains, which closely resembles that which is left after the dentine of the teeth has been deprived of its inorganic constituents.

For further information on this subject, the reader is referred to Dr. Carpenter's various articles on the microscopic structure of shells, and especially to his article "Shell" in the *Cyclopædia of Anatomy and Physiology* (from which the materials of the present article have been almost entirely drawn), and to his *Microscope and its Revelations*.

SHELLDRAKE, or **SHIELDRAKE**, *Tadorna*, a genus of ducks of the section having the hind-toe without any pendent membrane. The shelldrakes are a connecting link between geese and ducks, having much resemblance to the former. The species are mostly natives of the southern hemisphere, but the COMMON SHELLDRAKE (*T. vulpanser*, or *bellonii*) is common on the sandy sea-shores of Britain; many coming from the n. for the winter, and some remaining all the year, and breeding, making their nests in rabbit-burrows or other holes in soft soil, whence in some places the shelldrake receives the name of *burrow duck*. It is a beautiful bird, the sexes nearly alike in plumage; the head and upper part of the neck green, with a collar of white, and a lower collar of rich chestnut, extending over part of the back, the rest of the back white. The whole length is fully two feet. The shelldrake is very capable of being tamed, and breeds in domestication. Its note is a shrill whistle. Its flesh is coarse and unpalatable.—The RUDDY SHELLDRAKE (*T. rutila*), the only other European species, is rare as a British bird, although common in many parts of Europe and Asia.

SHELLEY, PERCY BYSSHE, the eldest son of sir Timothy Shelley, bart., the representative of an old Sussex family, was born at Field Place, near Horsham, in that county, on Aug. 4, 1792. His earlier education he received at home with his sisters. About the age of ten he was sent to a school near Brentford, and thence, three years after, transferred to Eton. Shy and sensitive, yet self-willed and unsubmitive, he suffered much from the harsh discipline of masters and the tyranny of his ruder associates. In his refusal to fag at Eton he gave early indication of that passionate impatience of every form of constituted authority not approving itself to his reason which continued through life to distinguish him, and to find expression in his writings. In 1808 he left school, and after two years passed at home he was sent to University college, Oxford. Even thus early he had become a free-thinker of a somewhat advanced kind, and a pamphlet, entitled *A Defense of Atheism*, which he circulated during the second year of his college course, led to his expulsion from Oxford. This so irritated his father, that for some time he declined to receive him; and on his rash marriage, in Aug., 1811, to a Miss Harriet Westbrook, the daughter of a retired innkeeper, the estrangement between them became final and complete, the old gentleman consenting to allow his son a liberal yearly income, but never after having any intercourse with him. Shelley's marriage was in its issue tragical. In 1813 a separation took place between him and his wife, who, with two children, returned to the care of her father; and three years after the unhappy

woman drowned herself. The refinements of intellectual sympathy which poets desiderate in their spouses, Shelley failed to find in his wife, but for a time he seems to have lived with her not unhappily; nor to the last had he any fault to allege against her, except such negative ones as might be implied in his meeting a woman he liked better. This was Mary Godwin, daughter of the celebrated William Godwin and Mary Wollstonecraft, with whom, in 1814, he traveled in France and Switzerland, and who afterward became his second wife. Such excuse of his conduct in the matter as the theory of "congenial souls" may afford in the eye of the moralist must to the full be allowed for Shelley, whose later union was of almost ideal felicity and completeness. On the death of his first wife he laid claim to his children; but this their grandfather, Mr. Westbrook, strange as it may now seem, successfully resisted at law on the ground of his atheism, as exhibited in the poem of *Queen Mab*, which a year or two before he had printed, though only for private circulation. In 1815, while living at Bishopsgate, near Windsor, he wrote his *Alastor*, one the most finished and characteristic of his works; which was followed by *The Revolt of Islam*, composed in 1817 at Marlow. During the interval, in the course of a tour in Switzerland, he had formed the acquaintance of lord Byron, with whom afterward in Italy he had much intimate intercourse. In Mar., 1818, he left England finally—as it proved—to proceed to Italy; and during that and the following year, chiefly while a resident in Rome, he produced what may rank as his two finest poems—the grand lyrical drama of *Prometheus Unbound* and the tragedy of *The Cenci*. While at Venice with lord Byron in 1820 he wrote *Julian and Maddalo*, a record in enduring verse of an interesting conversation of the discussional kind between the noble poet and himself. His other works of chief importance are: *Rosalind and Helen*, begun before he left England; *The Witch of the Atlas*, written in 1819; *Ejapychidion*; *Adonais* (a lament on the death of Keats); and *Hellas* (a lyrico-dramatic burst of exultation on the outbreak of the Greek war of liberty)—all three produced in 1821. The winter of 1822 Shelley passed at Pisa; and in the April following he established himself near Lerici, in the gulf of Spezia. His fondness for boating had through life amounted to a passion, and here he indulged it to the full. On July 8, 1823, in the company of an ex-naval friend, Mr. Williams, he sailed from Leghorn, whither he had gone to welcome his friend, Mr. Leigh Hunt, to Italy, and was lost in a sudden squall on his voyage homeward. The bodies were, after some time, washed ashore, and were burned, as the quarantine law of the country required, in presence of lord Byron, Mr. Leigh Hunt, and another intimate friend, Mr. Trelawney. Shelley's ashes were carefully preserved, and lie buried in the Protestant cemetery at Rome, near the grave of Keats.

In Shelley's opinions, religious, social, and political, crude as they often were, and everywhere expressed with an unwise reckless vehemence, there was much that might reasonably offend; and they not only on their own account roused against him a storm of obloquy, but made him throughout life the accredited mark of the most foul and malicious slanders. To this chiefly it is to be attributed that, whilst he lived, his genius met with no wide appreciation; but since, it has been amply recognized, and perhaps no writer of his time at this day ranks higher on the whole than he. In sustained lyrical impetuosity Shelley surpasses every other writer; his diction is not more remarkable for its opulence than for the expressive subtlety and precision with which it defines the nicest refinements of feeling and thought; and his page flashes with imagery like a royal robe rich with gems. But too often, while he dazzles, he also bewilders; he is fond of supersubtle abstractions, unsubstantial as clouds or dreams; and frequently in reading him we seem merely to be looking on wreaths of rainbow-colored mist. This want of clear and firm outlines is more or less felt throughout all his larger works, with the single exception of *The Cenci*, in which a terrible story of real life is dramatized with consummate vigor and directness of treatment. As to the matter of the rest of his poems, they concern themselves, for the most part, not with the world as it is or has been, but with a perfected world which is to be. Shelley is the *vates* of the future, as Scott is the poet of the past. Of the charge of atheism against Shelley it is enough to say that it rests mainly on his boyish poem of *Queen Mab*; that this he did not himself give to the world; and that when, in 1821, it was surreptitiously published, he issued an express protest against his being held answerable for any opinions set forth in it. In his later works a vague pantheism seems indicated; and one or two passages occur which fairly admit of a purely theistic interpretation. Perhaps the most complete edition of Shelley's poems is that by J. Buxton Forman (1880). A selection from his letters, with translations and prose essays, appeared in 1840. A complete edition of his poems, edited by G. E. Woodberry, appeared in 1892. See Medwin's *Life of Shelley* (1849); Trelawney's *Recollections of the Last Days of Shelley and Byron* (Lond. 1858); the *Shelley Memorials* by lady Shelley (1859); *Shelley's Early Life*, by D. MacCarthy (1872); and lives by G. Barnett Smith and J. H. Symonds.

By common testimony of all who knew him, Shelley, who was held up to execration as a perfect monster of iniquity, was one of the purest, gentlest, most lovable of men; of the tenderest private affections, and, beyond the immediate circle of these, of the largest flowing charity. The passion of philanthropy expressed in his writings found as practical an expression in his daily life as if he had never made any very great profession of it. The episode of his first marriage seems more or less awkward for him; but the one passionate frailty of a boy can scarcely be held a serious blemish on a man whose whole subsequent life was exceptional in virtue and beneficence.

MARY WOLLSTONECRAFT GODWIN, wife of the poet, was b. in London, 1797, married Shelley, as above stated, in 1816, and two years later produced a remarkable novel, entitled *Frankenstein*, the hero of which, a profound student of nature, discovers the secret of creating life, and produces a monster whose history, though wild and horrible in its incidents, is invested with a strong human interest. The work had a great success, and may be reckoned the best of Mrs. Shelley's literary efforts. Other novels of hers are *Valperga*; *The Last Man*; *Lodore*; and *The Fortunes of Perkin Warbeck*. She likewise wrote *Rambles in Germany and Italy*; a series of biographies of foreign artists and poets for the *Cabinet Cyclopædia*; and carefully edited her husband's poems. She died in London, Feb. 1, 1851. See *Mary Wollstonecraft*, by Paul (1878).

SHELL-GUNS belong rather to the past than the present, as in modern rifled artillery all guns fire shells. Before their introduction, however, shells were fired from guns of large bore, and proportionately small thickness of metal, not differing materially from howitzers, except that they had greater length.

SHELL-LAC. See LAC.

SHELLS, called in earlier times bombs, consist of hollow vessels of metal, containing gunpowder or other explosive compound, so arranged that it shall explode at a certain point, and spread destruction around by the forcible dispersion of its fragments. The invention of this murderous missile cannot be accurately traced. Shells were employed in 1480 A.D. by the sultan of Gujerat, and by the Turks at the siege of Rhodes, in 1522. The Spaniards and Dutch both used them during the war of Dutch independence; and they appear to have been generally adopted by about 1634. As shells required mortars (q.v.) for their projection, they were not used in naval warfare until the French constructed special bomb-vessels in 1681; but since that period, shell-guns, being cannon of large bore, have been introduced, and shells are now employed by all ships of war.

Until within a few years, every shell was a hollow sphere of cast-iron, varying in thickness from half an in. to 2 in., and in diameter from $5\frac{1}{2}$ in. to 13 inches. The sphere had a fuse-hole (like a bung-hole) an inch across, through which the charge was inserted consisting of pieces of metal and powder to burst the shell. The hole was plugged by a fuse, which was a tube of slow-burning powder, timed to communicate fire to the charge after the lapse of a certain number of seconds. This fuse might either be kindled by hand the moment before the mortar was fired, or its ignition might be effected by the act of firing itself. The Shrapnell shell, introduced by col. Shrapnell of the royal artillery, about 1808, contained a number of bullets, and being fired at bodies of men, it was timed to explode about 100 yards before reaching them, when the shell burst, and the bullets with the fragments continued their course, diverging continually as they went, until they reached their object in a death-cloud. The *concussion shell*, or *percussion shell*, is one in which the charge is fired by the detonation of a cap on striking an object. If sufficiently delicate to explode on touching a soft object, and at the same time not to be exploded by the resistance of the air to its rapid flight, this form of shell is the most certain in execution.

Since the introduction of rifled ordnance, the shell has become the commonest form of projectile. It has ceased to be spherical, and is usually in the shape of an elongated bolt. Several rival shells at present divide public favor, and compete for adoption into war service. Without noticing the numerous varieties which are in course of trial on the continent and in America, the following are the principal British competitors: The *Armstrong* shell is a pointed bolt of iron (usually percussion), containing an inner "segment shell," made up of 49 segments of cast-iron. Seven of these segments form a circle, or ring, and 7 circles give the necessary length. A coating of lead affords a soft medium for fitting into the grooves of the gun. The shell thus made somewhat resembles a bottle without a neck. The necessary bursting charge having been inserted, the rear-end is plugged with lead, the fuse is screwed into the front, and the shell is ready for action. This projectile has a great and accurate range, and its segments cannot fail, on explosion, to do great damage. The principal drawback has been found in the lead-casing, which is often thrown off in parts soon after the shell leaves the gun, and which thus falls among the foremost ranks of the army using it, sometimes inflicting severe wounds. The *Whitworth* shell is an elongated hexagonal bolt of iron or steel, cast in one piece, and with a bursting charge at the rear end. It explodes on percussion; but the space allowed for the burster is deemed insufficient to produce the full effect which the length and correctness of the weapon's range give cause to expect. The *Lancaster* shell is oval, to fit the bore of the *Lancaster* gun. *Martin's* shell is charged with molten iron, which sets on fire all combustible matter on which it can be thrown. The *Diaphragm* shell, invented by Col. Boxer, R.A., has an iron division or diaphragm to separate the powder in the shell from any balls or slugs, in order that the friction of the latter may not prematurely cause the powder to explode. A six-pounder diaphragm shell contains 30 carbine-balls, an eight-inch shell, 322 musket-balls. The *Palliser* shell, which is now employed in the British service, is chiefly remarkable for the hardness imparted to its fire-point by a process of "chilling" during casting. See illus., NAVY, vol. X.; also illus., CANNON, ETC., vol. III. See ORDNANCE.

SHELL-SAND. Sand consisting in great part of fragments of shells, and often containing a small proportion of organic matter, is a very useful manure, particularly for

clay soils, heavy loams, and newly-reclaimed bogs. It is also advantageously applied to any soil deficient in lime. It neutralizes the organic acids which abound in peat and forms with them compounds which serve as food for plants. Great deposits of shell-sand are found on the coasts of Devonshire and Cornwall, and are of great value in the agriculture of that district. Shell-sand is also found on many other parts of the British coast, and nowhere more abundantly than in the outer Hebrides. The sand of many parts of the coast, however, being mostly silicious, is incapable of the same use. Shell-sand is much used as a manure in some of the maritime districts of France.

SHELLY'S CASE. There is a rule of real-property law known as "the rule in Shelly's case," established in a case decided in 1591, and reported in Coke i. 104. "When the ancestor," says Coke, "by any gift or conveyance taketh an estate of freehold, and in the same gift or conveyance an estate is limited, either mediately or immediately, to his heirs in fee or in tail, *the heirs* are words of limitation and not words of purchase." The rule is interpreted by Preston, *Estates*, vol. i. as follows: When a person takes an estate of freehold (i.e., for life) under an instrument which also contains a limitation by way of remainder, with or without an intermediate estate interposed, to his heirs or the heirs of his body, *as a class of persons*, the limitation to the heirs entitles the ancestor to the whole estate. The rule has been abolished by statute in most of the states.

SHELTER ISLAND, a town in Suffolk co., N. Y., comprising the island of that name between Great Peconic and Gardiner's bays; pop. '90, 921. The island was settled by emigrants from Connecticut in 1652. It is near the e. end of Long Island, is a popular summer resort, and has a union free school and a public library.

SHELTON, FREDERICK WILLIAM, 1814-81; b. Jamaica, L. I. He was graduated at Princeton college, 1834; studied theology; was successively rector of Protestant Episcopal churches in Huntington, L. I., Fishkill, N. Y., and Montpelier, Vt. After 1854 his home was at Carthage, N. Y., and his work was strictly literary. Among his works, which are largely humorous, are *The Trollopiad* (1837); *The Rector of Saint Bardolph's* (1853); *Peeps from a Belfry* (1855).

SHEMAKHA, the former name for what is now known as the government of Baku, occupying the s.e. portion of Transcaucasia. Area, 15,095 sq. m.; pop. '92, 768,536. North of the Kur and around its mouth the surface is level, low, and fruitful, though little of it is under cultivation. Only in the towns and seaports, and in the villages in their vicinity, are agriculture and industry pursued. There is some cattle breeding, and considerable naphtha is produced.

SHEMITIC LANGUAGES are those dialects supposed at one time to have been employed by the tribes and races descended from Shem, the son of Noah. In Hebrew, the name from which the adjective is derived, is spelt *Shem*; but, as in many other cases, the *sh* of the original was transformed by the Septuagint into *s* (see SHIBBOLETH); and hence, through the influence of the modern versions that have in this respect followed the Septuagint, the form *Semitic* is more current among continental writers than *Shemitic*.

The name *Shemitic* is not, of course, scientifically and ethnologically exact, for, in the first place, not all the nations derived in Genesis from Shem spoke an idiom akin to those understood by the term Shemitic (e.g., the Elamites, Lud, etc.), and, on the other hand, Canaan and Cush, whose Shemitic speech is undoubted, are there traced to Ham. Shemitic languages, however, as a "conventional appellation," is still the best of all the general terms hitherto proposed (Arabic; Syro-Arabic, analogous to Indo-Germanic).

The family of Shemitic languages which spread originally over Canaan (Phenicia and Palestine), Assyria, Aram (Syria, Mesopotamia, Babylonia), and Arabia; and at a later period over part of Asia Minor and the Punic northern coast—i.e., from the countries on the Mediterranean to the Tigris, and from the Armenian mountains to the s. coast of Arabia—may broadly be divided into three principal classes: 1. The Aramaic or northern (north-eastern) dialect, comprising chiefly the so-called Chaldee and Syriac; 2. The southern, the chief representative of which is the Arabic, closely allied to whose older (Himyaritic) form is the Ethiopic; 3. The Middle, or principally Hebraic, to which also belong the languages of the other Palestinian inhabitants, those of the Canaanites and Phenicians above all. The difference between the middle and northern branches is less sharply marked than between the middle and the southern or Arabic.

The question which of the known Semitic dialects most resembles the primitive Semitic language is less important than one might at first suppose, since the question is not one of absolute, but only of relative priority. After scholars had given up the notion (which, however, was not the fruit of scientific research) that all Semitic languages, and indeed all the languages in the world, were descendants of Hebrew or of Aramaic, it was long the fashion to maintain that Arabic bore a close resemblance to the primitive Semitic language. But just as it is now recognized with ever-increasing clearness that Sanskrit is far from having retained, in such a degree as was even lately supposed, the characteristics of primitive Indo-European speech, so in the domain of the Semitic tongues we can assign to Arabic only a relative antiquity. It is true that in Arabic very many features are preserved more faithfully than in the cognate languages; for instance, nearly all the original abundance of consonants, the short vowels in open syllables, particularly in the interior of words, and many grammatical distinctions

which in the other languages are more or less obscured. But, on the other hand, Arabic has coined, simply from analogy, a great number of forms which, owing to their extreme simplicity, seem at the first glance to be primitive forms, but which nevertheless are only modifications of the primitive forms; while, perhaps, the other Semitic languages exhibit modifications of a different kind. In spite of its great wealth, Arabic is characterized by a certain monotony, which can scarcely have existed from the beginning. Both Hebrew and Aramaic are in many respects more ancient than Arabic. This would, no doubt, be far more apparent if we knew Hebrew more completely and according to the original pronunciation of its vowels, and if we could discover how Aramaic was pronounced about the 13th century before our era. It must always be borne in mind that we are far more fully and accurately acquainted with Arabic than with the other Semitic languages of antiquity. The opinion sometimes maintained by certain over-zealous Assyriologists, that Assyrian is the "Sanskrit of the Semitic world," has not met with the approval even of the Assyriologists themselves, and is unworthy of a serious refutation. A comparative grammar of the Semitic languages must, of course, be based upon Arabic, but must in every matter of detail take into consideration all the cognate languages, as far as they are known to us. In the reconstruction of the primitive Semitic tongue Hebrew might, perhaps, afford more assistance than Ethiopic; but Aramaic, Assyrian, and even the less known and the more modern dialects might furnish valuable materials.

Many attempts have been made, sometimes in a very superficial fashion and sometimes by the use of scientific methods, to establish a relationship between the Semitic languages and the Indo-European. It was very natural to suppose that the tongues of the two races which, with the single exceptions of the Egyptians and the Chinese, have formed and moulded human civilization, who have been near neighbors from the earliest times, and who, moreover, seem to bear a great physical resemblance to one another, can be nothing else than two descendants of the same parent speech. But all these endeavors have wholly failed. It is indeed probable that the language not only of the Semites and of the Indo-Europeans, but also those of other races are derived from the same stock, but the separation must have taken place at so remote a period, that the changes which these languages underwent in prehistoric times have completely effaced what features they possessed in common; if such features have sometimes been preserved, they are no longer recognizable. It must be remembered that it is only in exceptionally favorable circumstances that cognate languages are so preserved during long periods as to render it impossible for scientific analysis to prove their relationship with one another.

On the other hand, the Semitic languages bear so striking a resemblance in some respects to certain languages of northern Africa, that we are forced to assume the existence of a tolerably close relationship between the two groups. We allude to the family of languages known in modern times as the "Hamitic," and composed of the Egyptian, Berber, Beja (Bishâri, etc.), and a number of tongues spoken in Abyssinia and the neighboring countries (Agaw, Galla, Dankali, etc.). It is remarkable that some of the most indispensable words in the Semitic vocabulary (as, for instance, "water," "mouth," and certain numerals) are found in Hamitic also, and that these words happen to be such as cannot well be derived from triliteral Semitic roots, and are more or less independent of the ordinary grammatical rules. We notice, too, important resemblances in grammar—for example, the formation of the feminine by means of a *t* prefixed or affixed, that of the causative by means of *s*, similarity in the suffixes and prefixes of the verbal tenses, and, generally, similarity in the personal pronouns, etc. It must be admitted that there is also much disagreement—for instance, the widest divergence in the mass of the vocabulary; and this applies to the Semitic languages as compared not only with those Hamitic languages that are gradually becoming known to us at the present day, but with the Egyptian, of which we possess documents dating from the fourth millennium before the Christian era. The question is here involved in great difficulties. Some isolated resemblances may, improbable as it appears, have been produced by the borrowing of words. Uncivilized races, as has been proved with certainty, sometimes borrow from others elements of speech in cases where we should deem such a thing impossible—for example, numerals and even personal suffixes. But the great resemblances in grammatical formation cannot be reasonably explained as due to borrowing on the part of the Hamites, more especially as these points of agreement are also found in the language of the Berbers, who are scattered over an enormous territory, and whose speech must have acquired its character long before they came into contact with the Semites. We are even now but imperfectly acquainted with the Hamitic languages; it is not yet certain into what groups they fall; and the relation in which Egyptian stands to Berber on the one hand, and to the south Hamitic languages on the other, requires further elucidation. The attempt to write a comparative grammar of the Semitic and Hamitic languages would be, to say the least, very premature.

The connection between the Semitic languages and the Hamitic appears to indicate that the primitive seat of the Semites is to be sought in Africa; for it can scarcely be supposed that the Hamites, among whom there are gradual transitions from an almost purely European type to that of the Negroes, are the children of any other land than "the dark continent." There seems, moreover, to be a considerable physical resem-

balance between the Hamites and the Semites, especially in the case of the southern Arabs; we need mention only the slight development of the calf of the leg, and the sporadic appearance among Semites of woolly hair and prominent jaws. But both Semites and Hamites have been mingled to a large extent with foreign races, which process must have diminished their mutual similarity. All this, however, is offered not as a definite theory, but as a modest hypothesis.

It is not very easy to settle what is the precise connection between the various Semitic languages, considered individually. In this matter one may easily be led to hasty conclusions by isolated peculiarities in vocabulary or grammar. Each of the older Semitic languages occasionally agrees in grammatical points with some other, to which in most respects it bears no very close resemblance, while dialects much more closely related to it are found to exhibit different formations. Each Semitic tongue also possesses features peculiar to itself. For instance, the Hebrew-Phœnician group and the Arabic have a prefixed definite article (the etymological identity of which is, however, not quite certain); the dialect nearest to Arabic, the Sabæan, expresses the article by means of a suffixed *n*; the Aramaic, which in general more closely resembles Hebrew than does the Arabic group, expresses it by means of a suffixed *ā*; whereas the Assyrian in the north and the Ethiopic in the south have no article at all. Of this termination *n* for the definite article there is no trace in either Arabic or Hebrew; the Sabæan, the Ethiopic, and the Aramaic employ it to give emphasis to demonstrative pronouns; and the very same usage has been detected in a single Phœnician inscription. In this case, therefore, Hebrew and Arabic have, independently of one another, lost something which the languages most nearly related to them have preserved. In like manner, the strengthening of the pronoun of the third person by means of *t* (or *tū*) is only found in Ethiopic, Sabæan, and Phœnician. Aramaic alone has no certain trace of the reflexive conjugation formed with prefixed *n*; Hebrew alone has no certain trace of the causative with *sha*. In several of the Semitic languages we can see how the formation of the passive by means of internal vocal change (as *kullima*, "he was addressed," as distinguished from *kallama*, "he addressed") gradually dropped out of use; in Ethiopic this process was already complete when the language first became literary; but in Aramaic it was not wholly so. In a few cases phonetic resemblances have been the result of later growth. For example, the termination of the plural masculine of nouns is in Hebrew *īm*, in Aramaic *in*, as in Arabic. But we know that Aramaic also originally had *m*, whereas the ancient Arabic forms have after the *n* an *a*, which appears to have been originally a long *ā* (*īna*, *ina*); in this latter position (that is, between two vowels) the change of *m* into *n* is very improbable. These two similar terminations were, therefore, originally distinct. We must indeed be very cautious in drawing conclusions from points of agreement between the vocabularies of the various Semitic tongues. The Ethiopians and the Hebrews have the same word for many objects which the other Semites call by other names—for instance, "stone," "tree," "enemy," "enter," "go out;" and the same may be said of Hebrew as compared with Sabæan. But to build theories upon such facts would be unsafe, since the words cited are either found, though with some change of meaning, in at least one of the cognate languages, or actually occur, perhaps quite exceptionally and in archaic writings, with the same signification. The sedentary habits of the Ethiopians and the Sabæans may possibly have rendered it easier for them to retain in their vocabulary certain words which were used by the civilized Semites of the north, but which became obsolete among the Arabian nomads. To the same cause we may attribute the fact that in religion the Sabæans resemble the northern Semites more closely than do the tribes of central Arabia; but these considerations prove nothing in favor of a nearer linguistic affinity.

One thing at least is certain, that Arabic (with Sabæan) and Ethiopic stand in a comparatively close relationship to one another, and compose a group by themselves, as contrasted with the other Semitic languages, Hebrew-Phœnician, Aramaic, and Assyrian, which constitute the northern group. Only in these southern dialects do we find, and that under forms substantially identical, the important innovation known as the "broken plurals." They agree, moreover, in employing a peculiar development of the verbal root, formed by inserting an *ā* between the first and second radicals (*kātala*, *takātala*), in using the vowel *a* before the third radical in all active perfects—for example (*h*)*aktala kattala*, instead of the *haktil*, *kattil* of the northern dialects—and in many other grammatical phenomena. This is not at all contradicted by the fact that certain aspirated dentals of Arabic (*th*, *dh*, *ṭh*) are replaced in Ethiopic, as in Hebrew and Assyrian, by pure sibilants—that is, *s* (Hebrew and Assyrian *sh*), *z*, *ṣ*—whereas in Aramaic they are replaced by simple dentals (*t*, *d*, *ṭ*), which seem to come closer to the Arabic sounds. After the separation of the northern and the southern groups, the Semitic languages possessed all these sounds, as the Arabic does, but afterwards simplified them, for the most part, in one direction or the other. Hence there resulted, as it were by chance, occasional similarities. Even in modern Arabic dialects *th*, *dh* have become sometimes *t*, *d*, and sometimes *s*, *z*. Ethiopic, moreover, has kept *d*, the most peculiar of Arabic sounds, distinct from *c*, whereas Aramaic has confounded it with the guttural 'ain, and Hebrew and Assyrian with *c*. It is therefore evident that all these languages once possessed the consonant in question as a

distinct one. One sound, *śn*, appears only in Hebrew, in Phœnician, and in the older Aramaic. It must originally have been pronounced very like *sh*, since it is represented in writing by the same character; in later times it was changed into an ordinary *s*. Assyrian does not distinguish it from *sh*. The division of the Semitic languages into the northern group and the southern is therefore justified by facts. Even if we were to discover really important grammatical phenomena in which one of the southern dialects agreed with the northern, or *vice versâ*, and that in cases where such phenomena could not be regarded either as remnants of primitive Semitic usage, or as instances of parallel but independent development, we ought to remember that the division of the two groups was not necessarily a sudden and instantaneous occurrence, that even after the separation intercourse may have been carried on between the various tribes who spoke kindred dialects and were therefore still able to understand one another, and that intermediate dialects may once have existed, perhaps such as were in use amongst tribes who came into contact sometimes with the agricultural population of the north and sometimes with the nomads of the south (see below). All this is purely hypothetical, whereas the division between the northern and the southern Semitic languages is a recognized fact.

HEBREW.—Hebrew and Phœnician are but dialects of one and the same language. It is only as the language of the people of Israel that Hebrew can be known with any precision. Since in the Old Testament a few of the neighboring peoples are represented as being descended from Eber, the eponym of the Hebrews—that is, are regarded as nearly related to the latter, it was natural to suppose that they likewise spoke Hebrew—a supposition which, at least in the case of the Moabites, has been fully confirmed by the discovery of the Mesha inscription (date soon after 900 B.C.). The language of this inscription scarcely differs from that of the Old Testament; the only important distinction is the occurrence of a reflexive form (with *t* after the first radical), which appears nowhere else but in Arabic. We may remark in passing that the style of this inscription is quite that of the Old Testament, and enables us to maintain with certainty that a similar historical literature existed among the Moabites. But it must be remembered that ancient Semitic inscriptions exhibit, in a sense, nothing but the skeleton of the language, since they do not express the vowels at all, or do so only in certain cases; still less do they indicate other phonetic modifications, such as the doubling of consonants, etc. It is therefore very possible that *to the ear* the language of Moab seemed to differ considerably from that of the Judeans.

The Mesha inscription is the only non-Israelite source from which any knowledge of ancient Hebrew can be obtained. (See *Jews—Language and Literature*.) Some fragments in the Old Testament belong to the second millennium before our era, particularly the song of Deborah (Judges v.), a document which, in spite of its many obscurities in matters of detail, throws much light on the condition of the Israelites at the time when the Canaanites were still contending with them for the possession of the country. The first rise of an historical literature may very probably date from before the establishment of the monarchy. Various portions of the Old Testament belong to the time of the earlier kings; but it was under the later kings that a great part of extant Hebrew literature came into shape. To this age belong also the Siloam inscription and a few seals and gems bearing the names of Israelites. The Hebrew language is thus known to us from a very ancient period. But we are far from being acquainted with its real phonetic condition in the time of David or Isaiah. For, much as we owe to the labors of the later Jewish schools, which with infinite care fixed the pronunciation of the sacred text by adding vowels and other signs, it is evident that even at the best they could only represent the pronunciation of the language in its latest stage, not that of very early ages. Besides, their object was not to exhibit Hebrew simply as it was, but to show how it should be read in the solemn chant of the synagogue. Accordingly the pronunciation of the older period may have differed considerably from that represented by the punctuation. Such differences are now and then indicated by the customary spelling of the ancient texts, and sometimes the orthography is directly at variance with the punctuation. In a few rare cases we may derive help from the somewhat older tradition contained in the representation of Hebrew words and proper names by Greek letters, especially in the ancient Alexandrine translation of the Bible (the so-called Septuagint). It is of particular importance to remark that this older tradition still retains an original *α* in many cases where the punctuation has the later *i* or *e*. We have examined this point somewhat in detail, in order to contradict the false, but ever-recurring notion that the ordinary text of the Bible represents without any essential modification the pronunciation of ancient Hebrew, whereas in reality it expresses (in a very instructive and careful manner, it is true) only its latest development, and that for the purpose of solemn public recitation. A clear trace of dialectal differences within Israel is found in Judges xii. 6, which shows that the ancient Ephraimites pronounced *s* instead of *sh*.

The ancient Hebrew language, especially in the matter of syntax, has an essentially primitive character. Parataxis of sentences prevails over hypotaxis to a greater extent than in any other literary Semitic language with which we are well acquainted. The favorite method is to link sentences together by means of a simple "and." There is a great lack of particles to express with clearness the more subtle connection of ideas.

The use of the verbal tenses is in a great measure determined by the imagination, which regards things unaccomplished as accomplished and the past as still present. There are but few words or inflections to indicate slight modifications of meaning, though in ancient times the language may, perhaps, have distinguished certain moods of the verb somewhat more plainly than the present punctuation does. But in any case this language was far less suited for the definite expression of studied thought, and less suited still for the treatment of abstract subjects than for poetry. We must remember, however, that as long as Hebrew was a living language it never had to be used for the expression of the abstract. Had it lived somewhat longer it might very possibly have learned to adapt itself better to the formulating of systematic conceptions. The only book in the Old Testament which attempts to grapple with an abstract subject in plain prose—namely, Ecclesiastes—dates from a time when Hebrew was dying out or was already dead. That the gifted author does not always succeed in giving clear expression to his ideas, is partly due to the fact that the language had never been employed for any scientific purposes whatsoever. With regard to grammatical forms, Hebrew has lost much that is still preserved in Arabic; but the greater richness of Arabic is in part the result of later development.

The vocabulary of the Hebrew language is, as we have said, known but imperfectly. The Old Testament is no very large work; it contains, moreover, many repetitions, and a great number of pieces which are of little use to the lexicographer. On the other hand, much may be derived from certain poetical books, such as Job. The numerous ἀπαξ λεγόμενα are a sufficient proof that many more words existed than appear in the Old Testament, the writers of which never had occasion to use them. Were we in possession of the whole Hebrew vocabulary in the time of Jeremiah, for example, we should be far better able to determine the relation in which Hebrew stands to the other Semitic languages, the Old Testament would be far more intelligible to us, and it would be very much easier to detect the numerous corrupt passages in our text.

PHœNICIAN.—This dialect closely resembles Hebrew, and is known to us from only one authentic source—namely, inscriptions, some of which date from about 600 B.C. or earlier; but the great mass of them begin with the 4th century before our era. These inscriptions we owe to the Phœnicians of the mother country and the neighboring regions (Cyprus, Egypt, and Greece), as well as to the Phœnicians of Africa, especially Carthage. Inscriptions are, however, a very insufficient means for obtaining the knowledge of a language. The number of subjects treated in them is not large; many of the most important grammatical forms, and many of the words most used in ordinary life, do not occur. Moreover, the “lapidary style” is often very hard to understand. The repetition of obscure phrases, in the same connection, in several inscriptions, does not help to make them more intelligible. Of what use is it to us that, for instance, thousands of Carthaginian inscriptions begin with the very same incomprehensible dedication to two divinities? The difficulty of interpretation is greatly increased by the fact that single words are very seldom separated from one another, and that vowel-letters are used extremely sparingly. We therefore come but too often upon very ambiguous groups of letters. In spite of this, our knowledge of Phœnician has made considerable progress of late. Some assistance is also got from Greek and Latin writers, who cite not only many Phœnician proper names, but single Phœnician words: Plautus, in particular, inserts in the *Pœnulus* whole passages in Punic, some of which are accompanied by a Latin translation. This source of information must, however, be used with great caution. It was not the object of Plautus to exhibit the Punic language with precision, a task for which the Latin alphabet is but ill adapted, but only to make the populace laugh at the jargon of the hated Carthaginians. Moreover, he had to force the Punic words into Latin *senarii*; and finally the text, being unintelligible to copyists, is terribly corrupt. Much ingenuity has been wasted on the Punic of Plautus, but the passage yields valuable results to cautious investigation which does not try to explain too much. In its grammar Phœnician closely resembles Hebrew. In both dialects the consonants are the same, often in contrast to Aramaic and other cognate languages. As to vowels, Phœnician seems to diverge rather more from Hebrew. The connecting of clauses is scarcely carried further in the former language than in the latter. A slight attempt to define the tenses more sharply appears once, at least, in the joining of *kân* (fruit) with a perfect, to express complete accomplishment (or the pluperfect). One important difference is, that the use of *vâw* conversive with the imperfect—so common in Hebrew and in the inscription of Mesha—is wanting in Phœnician. The vocabulary of the language is very like that of Hebrew, but words rare in Hebrew are often common in Phœnician. For instance, “to do” is in Phœnician not *‘asâ* but *pa‘al* (the Arabic *fâ‘ala*), which in Hebrew occurs only in poetry and elevated language. “Gold” is not *zahab* (as in most Semitic languages), but *harûc* (Assyrian *hurûc*), which is used occasionally in Hebrew poetry. Traces of dialectal distinctions have been found in the great inscription of Byblus, the inhabitants of which seem to be distinguished from the rest of the Phœnicians in Josh. xii. 5 [and 1 Kings v. 32? [A. V. v. 18]]. It is probable that various differences between the language of the mother-country and that of the African colonies arose at an early date, but our materials do not enable us to come to any definite conclusion on this

point. In the later African inscriptions there appear certain phonetic changes, especially in consequence of the softening of the gutturals—changes which show themselves yet more plainly in the so-called Neo-Punic inscriptions (beginning with the 1st, if not the 2nd, century before our era). In these the gutturals, which had lost their real sound, are frequently interchanged in writing, and other modifications may also be perceived. Unfortunately the Neo-Punic inscriptions are written in such a debased, indistinct character that it is often impossible to discover with certainty the real form of the words. This dialect was still spoken about 400, and perhaps long afterwards, in those districts of North Africa which had once belonged to Carthage. It would seem that in the mother-country the Phœnician language withstood the encroachment of Greek on the one hand and of Aramaic on the other somewhat longer than Hebrew did.

ARAMAIC.—Aramaic is nearly related to Hebræo-Phœnician, but there is nevertheless a sharp line of demarcation between the two groups. Of its original home nothing certain is known. In the Old Testament "Aram" appears at an early period as a designation of certain districts in Syria ("Aram of Damascus," etc.) and in Mesopotamia ("Aram of the Two Rivers"). The language of the Arameans gradually spread far and wide, and occupied all Syria, both those regions which were before in the possession of the Kheta, probably a non-Semitic people, and those which were most likely inhabited by Canaanite tribes; last of all, Palestine became Aramaized. Towards the east this language was spoken on the Euphrates, and throughout the district of the Tigris south and west of the Armenian and Kurdish mountains; the province in which the capitals of the Arsacides and the Sassanians were situated was called "the country of the Arameans." In Babylonia and Assyria a large, or perhaps the larger portion of the population were most probably Arameans, even at a very early date, whilst Assyrian was the language of the Government.

The Aramaic portions of the Old Testament show us the form of the language which was in use among the Jews of Palestine. Isolated passages in Ezra perhaps belong to the Persian period, but have certainly been remodeled by a later writer. Yet in Ezra we find a few antique forms which do not occur in Daniel. The Aramaic pieces contained in the Bible have the great advantage of being furnished with vowels and other orthographical signs, though these were not inserted until long after the composition of the books, and are sometimes at variance with the text itself. But since Aramaic was still a living language when the punctuation came into existence, and since the lapse of time was not so very great, the tradition ran less risk of corruption than in the case of Hebrew. Its general correctness is further attested by the innumerable points of resemblance between this language and Syriac, with which we are accurately acquainted. The Aramaic of the Bible exhibits various antique features which afterwards disappeared—for example, the formation of the passive by means of internal vowel-change, and the causative with *ha* instead of with *a*, phenomena which have been falsely explained as Hebraisms. Biblical Aramaic agrees in all essential points with the language used in the numerous inscriptions of Palmyra (beginning soon before the Christian era and extending to about the end of the 3d century) and on the Nabatean coins and stone monuments (concluding about the year 100). Aramaic was the language of Palmyra, the aristocracy of which were to a great extent of Arabian extraction. In the northern portion of the Nabatean kingdom (not far from Damascus) there was probably a large Aramaic population, but farther south Arabic was spoken. At that time, however, Aramaic was highly esteemed as a cultivated language, for which reason the Arabs in question made use of it, as their own language was not reduced to writing, just as in those ages Greek inscriptions were set up in many districts where no one spoke Greek. That the Nabateans were Arabs is sufficiently proved by the fact that, with the exception of a few Greek names, almost all the numerous names which occur in the Nabatean inscriptions are Arabic, in many cases with distinctly Arabic terminations. A further proof of this is that in the great inscriptions over the tombs of Hejr (not far from Teimâ) the native Arabic continually shows through the foreign disguise—for instance, in the use of the Arabic words whenever the writer does not happen to remember the corresponding Aramaic terms, in the use of the Arabic particle *fa*, of the Arabic *ghair*, "other than," and in several syntactic features. The great inscriptions cease with the overthrow of the Nabatean kingdom by Trajan (105); but the Arabian nomads in those countries, especially in the Sinaitic peninsula, often scratched their names on the rocks down to a later period, adding some benedictory formula in Aramaic. The fact that several centuries afterwards the name of "Nabatean" was used by the Arabs as synonymous with "Aramean" was probably due to the gradual spread of Aramaic over a great part of what had once been the country of the Nabateans. In any case Aramaic then exercised an immense influence. This is also proved by the place which it occupies in the strange Pahlavi writing, various branches of which date from the time of the Parthian empire (see PEHLEVÍ). Biblical Aramaic, as also the language of the Palmyrene and Nabatean inscriptions, may be described as an older form of Western Aramaic. The opinion that the Palestinian Jews brought their Aramaic dialect direct from Babylon—whence the incorrect name "Chaldee"—is altogether untenable.

Not only the Jews but also the Christians of Palestine retained their native dialect for some time as an ecclesiastical and literary language. We possess translations of the

Gospels and fragments of other works in this dialect by the Palestinian Christians dating from about the 5th century, accompanied by a punctuation which was not added till some time later. This dialect closely resembles that of the Palestinian Jews, as was to be expected from the fact that those who spoke it were of Jewish origin.

Finally, the Samaritans, among the inhabitants of Palestine, translated their only sacred book, the Pentateuch, into their own dialect. The critical study of this translation proves that the language which lies at its base was very much the same as that of the neighboring Jews. Perhaps, indeed, the Samaritans may have carried the softening of the gutturals a little further than the Jews of Galilee. Their absurd attempt to embellish the language of the translation by arbitrarily introducing forms borrowed from the Hebrew original has given rise to the false notion that Samaritan is a mixture of Hebrew and Aramaic. The introduction of Hebrew and even of Arabic words and forms was practised in Samaria on a still larger scale by copyists who lived after Aramaic had become extinct. The later works written in the Samaritan dialect are, from a linguistic point of view, as worthless as the compositions of Samaritans in Hebrew; the writers who spoke Arabic endeavored to write in languages with which they were but half acquainted.

All these Western Aramaic dialects, including that of the oldest inscriptions, have this feature among others in common, that they form the third person singular masculine and the third person plural masculine and feminine in the imperfect by prefixing *y*, as do the other Semitic languages. And in these dialects the termination *û* (the so-called "status emphaticus") still retained the meaning of a definite article down to a tolerably late period.

As early as the 7th century the conquests of the Moslems greatly circumscribed the domain of Aramaic, and a few centuries later it was almost completely supplanted in the west by Arabic. For the Christians of those countries, who, like every one else, spoke Arabic, the Palestinian dialect was no longer of importance, and they adopted as their ecclesiastical language the dialect of the other Aramaean Christians, the Syriac (or Edessene). The only localities where a Western Aramaic dialect still survives are a few villages in Anti-Libanus. Our information upon this subject is but slight and fragmentary; but it is hoped that Professors Prym and Socin will soon be able to furnish more ample details.

At Edessa, in the west of Mesopotamia, the native dialect had already been used for some time as a literary language, and had been reduced to rule through the influence of the schools (as is proved by the fixity of the grammar and orthography), even before Christianity acquired power in the country in the 2nd century. At an early period the Old and New Testaments were here translated with the help of Jewish tradition. This version (the so-called Peshitta or Peshito) became the Bible of Aramaean Christendom, and Edessa became its capital. Thus the Aramaean Christians of the neighboring countries, even those who were subjects of the Persian empire, adopted the Edessan dialect as the language of the church, of literature, and of cultivated intercourse. Since the ancient name of the inhabitants, "Aramæans," just like that of *Ἑλλῆνες*, had acquired in the minds of Jews and Christians the unpleasant signification of "heathens," it was generally avoided, and in its place the Greek terms "Syrians" and "Syriac" were used. But "Syriac" was also the name given by the Jews and Christians of Palestine to their own language, and both Greeks and Persians designated the Aramaeans of Babylonia as "Syrians." It is, therefore, properly speaking, incorrect to employ the word "Syriac" as meaning the language of Edessa alone; but since it was the most important of these dialects, it has the best claim to this generally received appellation. It has, as we have said, a shape very definitely fixed; and in it the above-mentioned forms of the imperfect take an *n*. As in the Babylonian dialects, the termination *û* has become so completely a part of the substantive, to which it is added, that it has wholly lost the meaning of the definite article, whereby the clearness of the language is perceptibly impaired. The influence exercised by Greek is very apparent in Syriac. From the 3d to the 7th century an extensive literature was produced in this language, consisting chiefly, but not entirely, of ecclesiastical works. In the development of this literature the Syrians of the Persian empire took an eager part. In the Eastern Roman empire Syriac was, after Greek, by far the most important language; and under the Persian kings it virtually occupied a more prominent position as an organ of culture than the Persian language itself. The conquests of the Arabs totally changed this state of things. But meanwhile, even in Edessa, a considerable difference had arisen between the written language and the popular speech, in which the process of modification was still going on. About the year 700 it became a matter of absolute necessity to systematize the grammar of the language and to introduce some means of clearly expressing the vowels. The principal object aimed at was that the text of the Syriac Bible should be recited in a correct manner. But, as it happened, the eastern pronunciation differed in many respects from that of the west. The local dialects had to some extent exercised an influence over the pronunciation of the literary tongue; and, on the other hand, the political separation between Rome and Persia, and yet more the ecclesiastical schism—since the Syrians of the east were mostly Nestorians, those of the west Monophysites and Catholics—had produced divergencies between the traditions of the various schools. Starting, therefore, from a common source, two distinct systems of

punctuation were formed, of which the western is the more convenient, but the eastern the more exact and generally the more in accordance with the ancient pronunciation; it has, for example, *ḏ* in place of the western *ḍ*, and *ḥ* in many cases where the western Syrians pronounce *ḥ*. In later times the two systems have been intermingled in various ways.

Arabic everywhere put a speedy end to the predominance of Aramaic—a predominance which had lasted for more than a thousand years—and soon began to drive Syriac out of use. At the beginning of the 11th century the learned metropolitan of Nisibis, Elias bar Shinnáyá, wrote his books, intended for Christians, either entirely in Arabic or in Arabic and Syriac arranged in parallel columns—that is, in the spoken and in the learned language. Thus, too, it became necessary to have Syriac-Arabic glossaries. Up to the present day Syriac has remained in use for literary and ecclesiastical purposes, and may perhaps be even spoken in some monasteries and schools, but it has long been a dead language. When Syriac became extinct in Edessa and its neighborhood is not known with certainty.

This language, called Syriac *par excellence*, is not the immediate source whence are derived the Aramaic dialects still surviving in the northern districts. In the mountains known as the Túr 'Abdin in Mesopotamia, in certain districts east and north of Mosul, in the neighboring mountains of Kurdistan, and again beyond them on the western coast of Lake Urmia, Aramaic dialects are spoken by Christians and occasionally by Jews, and some of these dialects we know with tolerable precision. The dialect of Túr 'Abdin seems to differ considerably from all the rest; the country beyond the Tigris is, however, divided, as regards language, amongst a multitude of local dialects. Amongst these, that of Urmia has become the most important, since American missionaries have formed a new literary language out of it. Moreover, the Roman Propaganda has printed books in two of the Neo-Syriac dialects. All these dialects exhibit a complete transformation of the ancient type, to a degree incomparably greater than is the case, for example, with Mandaean. In particular, the ancient verbal tenses have almost entirely disappeared, but have been successfully replaced by new forms derived from participles. There are also other praiseworthy innovations. The dialect of Túr 'Abdin has, for instance, again coined a definite article. By means of violent contractions and phonetic changes some of these dialects, particularly that of Urmia, have acquired a euphony scarcely known in any other of the Semitic languages, with their *stridentia anhelantiaque verba* (Jerome). These Aramæans have all adopted a motley crowd of foreign words, from the Arabs, Kurds, and Turks, on whose borders they live and of whose languages they can often speak at least one.

ARABIC.—The southern group of Semitic languages consists of Arabic and Ethiopic. Arabic, again, is subdivided into the dialects of the larger portion of Arabia and those of the extreme south (the Sabæan, etc.). At a very much earlier time than we were but lately justified in supposing, some of the northern Arabs reduced their language to writing; for travelers have quite recently discovered in the northern parts of the Hijáz inscriptions in a strange character, which seem to have been written long before our era. The character resembles the Sabæan, but perhaps represents an earlier stage of graphical development. These inscriptions have been called "Thamudic," because they were found in the country of the Thamúd; but this designation is scarcely a suitable one, because during the period when the power of the Thamúd was at its height, and when the buildings mentioned in the Koran were hewn in the rocks, the language of this country was Nabatæan (see above). Unfortunately the inscriptions hitherto discovered are all short, and for the most part fragmentary, and consequently furnish but little material to the student of languages. But there can be no doubt that they are written in an Arabic dialect. The treatment of the dentals, amongst other things, is a sufficient proof of this. At least in one point they bear a striking resemblance to Hebrew; they have the article *ha* (not *hal*, as we might expect). It is possible that the tribes living on Arabian soil which are regarded in the Old Testament as nearly related to Israel—that is, the Ismaelites, the Midianites, and even the Edomites, may have spoken dialects occupying a middle position between Arabic and Hebrew. They are perhaps traces of some such intermediate link that have been preserved to us in these inscriptions.

The numerous inscriptions scattered over the northwest of Arabia, especially over the wild and rocky district of Safá, near Damascus, probably date from a later period. They are written in peculiar characters, which, it would seem, are likewise related to those used by the Sabæans. They are all of them short and indistinct, scratched hurriedly and irregularly upon unhewn stone. What we at present understand of them—they consist almost entirely of proper names—is owing in nearly every case to the ingenuity of Halévy. In matters of detail, however, much still remains uncertain. To decipher them with absolute certainty will no doubt always be impossible on account of their careless execution. These inscriptions are probably the work of Arab emigrants from the south.

During the whole period of the preponderance of Aramaic this language exercised a great influence upon the vocabulary of the Arabs. The more carefully we investigate the more clearly does it appear that numerous Arabic words, used for ideas or objects which presuppose a certain degree of civilization, are borrowed from

the Aramæans. Hence the civilizing influence of their northern neighbors must have been very strongly felt by the Arabs, and contributed in no small measure to prepare them for playing so important a part in the history of the world.

The Koran and Islam raised Arabic to the position of one of the principal languages of the world. Under the leadership of the Koraish the Bedouins subjected half the world to both their dominion and their faith. Thus Arabic acquired the additional character of a sacred language. But soon it became evident that not nearly all the Arabs spoke a language precisely identical with the classical Arabic of the poets. The north-western Arabs played a particularly important part during the period of the Omayyads. The ordinary speech of Mecca and Medina was, as we have seen, no longer quite so primitive as that of the desert. To this may be added that the military expeditions brought those Arabs who spoke the classical language into contact with tribes from out-of-the-way districts, such as 'Omán, Bahrain (Bahrein), and particularly the north of Yemen. The fact that numbers of foreigners, on passing over to Islam, became rapidly Arabized was also little calculated to preserve the unity of the language. Finally, the violent internal and external commotions which were produced by the great events of that time, and stirred the whole nation, probably accelerated linguistic change. In any case, we know from good tradition that even in the 1st century of the Flight the distinction between correct and incorrect speech was quite perceptible.

About the end of the 2d century the system of Arabic grammar was constructed, and never underwent any essential modification in later times. The theory as to how one should express one's self was now definitely fixed. The majority of those Arabs who lived beyond the limits of Arabia already diverged far from this standard; and in particular the final vowels which serve to indicate cases and moods were no longer pronounced. This change, by which Arabic lost one of its principal advantages, was no doubt hastened by the fact that even in the classical style such terminations were omitted whenever the word stood at the end of a sentence (in pause); and in the living language of the Arabs this dividing of sentences is very frequent. Hence people were already quite accustomed to forms without grammatical terminations.

ETHIOPIC.—In Abyssinia, too, and in the neighboring countries, we find languages which bear a certain resemblance to Arabic. The Geez or Ethiopic proper, the language of the ancient kingdom of Aksúm, was reduced to writing at an early date. To judge by the few passages communicated by Salt, the back of the inscription of Aízanás, king of Aksúm about 350, exhibits writing in the Sabæan language, which appears to prove that the development of the Geez character out of the Sabæan, and the elevation of Geez to the rank of a literary language, must have taken place after the year 350. The oldest monuments of this language which are known with certainty are the two great inscriptions of Tázéná, a heathen king of Aksúm dating from about 500. Hitherto our acquaintance with these inscriptions has been derived from very imperfect drawings; but they amply suffice to show that we have here the same language as that in which the Ethiopic Bible is written, with the very same exact indication of the vowels—a point in which Ethiopic has an advantage over all other Semitic characters. Who introduced this vocalization is unknown. When the above-mentioned inscriptions were made the Bible had probably been already translated into Geez from the Greek, perhaps in part by Jews; for Jews and Christians were at that time actively competing with one another, both in Arabia and in Abyssinia; nor were the former unsuccessful in making proselytes. The missionaries who gave the Bible to the Abyssinians must, at least in some cases, have spoken Aramaic as their mother-tongue, for this alone can explain the fact that in the Ethiopic Bible certain religious conceptions are expressed by Aramaic words. During the following centuries various works were produced by the Abyssinians in this language; they were all, so far as we are able to judge, of a more or less theological character, almost invariably translations from the Greek. We cannot say with certainty when Geez ceased to be the language of the people, but it was probably about a thousand years ago. From the time when the Abyssinian kingdom was reconstituted, towards the end of the 13th century, by the so-called Solomonian dynasty (which was of southern origin), the language of the court and of the Government was Amharic; but Geez remained the ecclesiastical and literary language, and Geez literature even showed a certain activity in numerous translations from those Arabic and Coptic works which were in use amongst the Christians of Egypt; besides these a few original writings were composed—namely, lives of saints, hymns, etc. This literary condition lasted till modern times. The language, which had long become extinct, was by no means invariably written in a pure form; indeed, even in manuscripts of more ancient works we find many linguistic corruptions, which have crept in partly through mere carelessness and ignorance, partly through the influence of the later dialects. On points of detail we are still sometimes left in doubt, as we possess no manuscripts belonging to the older period. This renders it all the more important that the ancient and authentic inscriptions upon the monuments of Aksúm should be accurately published.

GEEZ is more nearly related to Sabæan than to Arabic, though scarcely to such a degree as we might expect. The historical intercourse between the Sabæans and the people of Aksúm does not, however, prove that those who spoke Geez were simply a colony from Sabæa; the language may be descended from an extinct cognate dialect

of south Arabia, or may have arisen from a mingling of several dialects. And this colonization in Africa probably began much sooner than is usually supposed. In certain respects Geez represents a more modern stage of development than Arabic; we may cite as instances the loss of some inflectional terminations and of the ancient passive, the change of the aspirated dentals into sibilants, etc. In the manuscripts, especially those of later date, many letters are confounded—namely, *h*, *h*, and *kh*, *s* and *sh*, *ç* and *d*; this, however, is no doubt due only to the influence of the modern dialects. To this same influence, and indirectly, perhaps, to that of the Hamitic languages, we may ascribe the very hard sound now given to certain letters, *k*, *t*, *ç*, and *d*, in the reading of Geez. The last two are at present pronounced something like *ts* and *ts* (the German *z*). A peculiar advantage possessed by Geez and by all Ethiopic languages, is the sharp distinction between the imperfect and the subjunctive: in the former a vowel is inserted after the first radical—a formation of which there seems to be traces in the dialect of Mahra, and which is also believed to have existed in Assyrian. Geez has no definite article, but is very rich in particles. In the ease with which it joins sentences together and in its freedom as to the order of words, it resembles Aramaic. The vocabulary is but imperfectly known, as the theological literature, which is for the most part very arid, supplies us with comparatively few expressions that do not occur in the Bible, whereas the more modern works borrow their phraseology in part from the spoken dialects, particularly Amharic. With regard to the vocabulary, Geez has much in common with the other Semitic tongues, but at the same time possesses many words peculiar to itself; of these a considerable proportion may be of Hamitic origin. Even some grammatical phenomena seem to indicate Hamitic influence; for instance, the very frequent use of the gerundive, a feature which has become still more prominent in the modern dialects, placed as they are in yet closer contact with the Hamitic. We must not suppose that the ancient inhabitants of Aksum were of pure Semitic blood. The immigration of the Semites from Arabia was in all probability a slow process, and under such circumstances there is every reason to assume that they largely intermingled with the aborigines. This opinion seems to be confirmed by anthropological facts.

Very different is the case with AMHARIC, a language of which the domain extends from the left bank of the Takkazé into regions far to the south. Although by no means the only language spoken in these countries, it always tends to displace those foreign tongues which surround it and with which it is interspersed. We here refer especially to the Agaw dialects. Although Amharic has been driven back by the invasions of the Galla tribes, it has already compensated itself to some extent for this loss, as the Yedju and Wollo Gallas, who penetrated into eastern Abyssinia, have adopted it as their language. With the exception, of course, of Arabic, no Semitic tongue is spoken by so large a number of human beings as Amharic. The very fact that the Agaw languages are being gradually, and, as it were, before our own eyes, absorbed by Amharic, makes it appear probable that this language must be spoken chiefly by people who are not of Semitic race. This supposition is confirmed by a study of the language itself. Amharic has diverged from the ancient Semitic type to a far greater extent than any of the dialects which we have hitherto enumerated. Many of the old formations preserved in Geez are completely modified in Amharic. Of the feminine forms there remain but a few traces; and that is the case also with the ancient plural of the noun. The strangest innovations occur in the personal pronouns. And certainly not more than half the vocabulary can without improbability be made to correspond with that of the other Semitic languages. In this, as also in the grammar, we must leave out of account all that is borrowed from Geez, which, as being the ecclesiastical tongue, exercises a great influence everywhere in Abyssinia. On the other hand, we must make allowance for the fact that in this language the very considerable phonetic modifications often produce a total change of form, so that many words which at first have a thoroughly foreign appearance prove on further examination to be but the regular development of words with which we are already acquainted. But the most striking deviations occur in the syntax. Things which we are accustomed to regard as usual or even universal in the Semitic languages, such as the placing of the verb before the subject, of the governing noun before the genitive, and of the attributive relative clause after its substantive, are here totally reversed. Words which are marked as genitives by the prefixing of the relative particle, and even whole relative clauses, are treated as one word, and are capable of having the objective suffix added to them. It is scarcely going too far to say that a person who has learned no Semitic language would have less difficulty in mastering the Amharic construction than one to whom the Semitic syntax is familiar. What here appears contrary to Semitic analogy is sometimes the rule in Agaw. Hence it is probable that in this case tribes originally Hamitic retained their former modes of thought and expression after they had adopted a Semitic speech, and that they modified their new language accordingly. And it is not certain that the partial Semitization of the southern districts of Abyssinia (which had scarcely any connection with the civilization of Aksum during its best period) was entirely or even principally due to influences from the north. See Ernest Renan's interesting, though not always trustworthy, *Histoire Générale des Langues Sémitiques* and *Comparative Grammar of the Semitic Languages* (1890); also the special articles, AFRICAN LANGUAGES; ARABIAN LANGUAGE AND LITERATURE; ARAMÆA; ARAMAIC; ASSYRIA; BABYLON; ETHIOPIA; JEWS; PHENICIA; SYRIAC.

SHEMITIC NATIONS or **SHEMITES**. The different nations generally comprised under this name, viz., the Assyrians, the Chaldeans or Babylonians, the Syrians, Phenicians, Hebrews, Arabs, and Ethiopians, are all treated specially in the course of this work; it only remains here to add a few observations on the characteristics ascribed to them all in common, and on the influence they have exercised upon the history and development of humanity. As regards the language, the poverty of the inflections, the well-nigh absolute impossibility of expressing abstract ideas, the general absence of compound verbs and substantives, and the primitive state of the syntax in the Shemitic, as contrasted with the wealth and vigor of the Aryan, have been noticed in the previous article. From this arises, as an almost natural consequence, the general inferiority of Shemitic literature to what we emphatically call "classical literature." Certain most important forms of Indo-Germanic poetry, for instance, are completely wanting in the Shemitic, such as the epopee and the drama; although, on the other hand, the peculiar ancient form of Arabic poetry—the *Kasida*—and the grand bursts of pathos found in the religious books of the Hebrews are vainly sought in Indo-European literature. Again, a primitive state of law seems to have developed among the Aryan nations, the chief characteristic of which was a recognition, albeit a dim enough one, of individual rights, in as far as they did not war against the complex unity of the "state." With the Shemites, in the absence of that talent for organization and conciliation which is so essential a mark of the Indo-Europeans, we find either a patriarchal, an anarchical, or a despotical kind of government. Science and philosophy, in the larger sense of the word, are the almost exclusive property of the Aryans. The inferiority of the Shemites in these respects, however, is amply counterbalanced by the sublime place they take as the ethical teachers of all humanity. How the hard and narrow egotism which, not quite unjustly, is ascribed to them ever came to bear and ripen those grand moral maxims with which we meet in the earliest Jewish records, and which, wrought up to their purest idealism, form the shining glory of the New Testament, is a problem of which some seek the solution in a peculiar *intensity* of character inherent in the Shemitic races; while others account for it by direct "inspiration." The same may be said of that monotheism which belonged, in the first instance, to the Hebrews out of all the nations of the earth. It is a grave mistake, however, to describe, as Renan does, the Shemites indiscriminately as monotheists. Babylon or Assyria, and Syria or Phenicia, and the ante-Islamic Arabs, were neither more nor less polytheistic than the early or present inhabitants of India. And, we may well add, not before the return from the Babylonian exile are the Jews themselves, as a body, to be considered as real monotheists. But ever since, both they, and, from the time of Mohammed, the Arabs, have been the representatives of a more austere and exclusive dogma of the unity of the godhead than a great part of the civilized world has found good to accept up to this day.

SHEMITIC PLURAL. The Shemitic languages, particularly the Hebrew, often use the plural where other languages only make use of the singular. This is particularly the case in terms of space and time—their vastness being conceived, so to say, as a multiplicity. Thus certain regions, like heaven—which, through the influence of the Bible language, is also with us sometimes used *pluraliter*—the expanse of water; further, the place at a person's head or feet, or even certain limbs of the body (conceived as space), like neck, face, etc.; or, again, periods of times, like youth, age, life, and special *lasting* qualities or states, like barrenness, blindness, mercifulness, and the like, are put in plural number, where we have the singular only. It is further applied to might and strength, as consisting originally of a multiplicity of elements of power. This is particularly shown in the word *Elohim* (q.v.),=a unity of many "mights"—i.e., the Supreme Being. The false conclusions as to the plurality of the Divine Persons being proved by this word are best refuted by the occurrence of the plural in the word *Mastar* (Adon), Lord (Baal), when these stand unmistakably for a single human individual.

SHENANDO'AH, a river of Virginia, the largest tributary to the Potomac, drains the beautiful and fertile valley between the Blue ridge and the principal range of the Alleghanies. It rises in two branches near the center of the state, and runs n.e. to the Potomac, 170 m., being navigable for small boats 100 miles. In the war of 1861-65 this valley was the scene of numerous conflicts, was successively occupied by the opposing armies, and finally laid waste by Gen. Sheridan in the autumn of 1864.

SHENANDO'AH, a borough in Schuylkill co., Pa.; on the Lehigh Valley, the Pennsylvania and the Philadelphia and Reading railroads; 13 miles n. of Pottsville, the co. seat. It contains several of the largest coal mines in the anthracite region and many others in the vicinity, and has about 20 churches, electric light and electric street and suburban railroads, high school and public school libraries, national banks, building and loan associations, daily and weekly newspapers, and several manufactories. Pop. '90, 15,944.

SHENSTONE, WILLIAM, the son of Thomas Shenstone of the Leasowes, Hales Owen, Shropshire, and his wife, Anne Penn, was born there in the year 1714. In 1732 he was sent to Pembroke College, Oxford. While there he devoted himself much to the study of English poetry, and in 1737 he published without his name a small volume of miscellaneous verse. Subsequently, for some years, he lived in a somewhat vagrant way, yet without ceasing to cultivate his talent. In 1741 appeared his *Judgment of Hercules*; and next year *The Schoolmistress*, the work by which chiefly he continues to be remembered. In 1745, his parents being dead, he established himself on his property of the

Leasowes, where he thenceforth continued to reside. He busied himself with landscape gardening, and such was his success in beautifying his little estate, that it attracted visitors from all quarters, and brought him more fame than his poetry. He was thus, however, led into serious pecuniary embarrassments, from which, on Feb. 11, 1763, a putrid fever relieved him.

The Schoolmistress, which has secured for its author a permanent if humble place among English poets, is written in the stanza and antique manner of Spenser's *Faery Queen*; and in the contrast between the stateliness of the vehicle, and the familiar and homely quality of the subject, with the graphic truth of its treatment, there is a singular source of charm. The other works of Shenstone are for the most part quite insignificant; but his *Pastoral Ballad* has touches of exquisite tenderness and truth of sentiment expressed in a simple and appropriate melody.

SHEOL (LXX. *Hades, Thanatos, Vulg. Inferi*), a Hebrew term of very frequent occurrence (65 times) in the Old Testament, and rendered by the authorized version: grave, hell, or pit. Its derivation is doubtful: while some connect it with a root, denoting to seek, others derive it from a root, "to dig out," "to hollow" (compare Germ. *Hölle*). The use of the word in the original would seem to prove a great fluctuation of the dogma respecting the world to come, during the various periods represented in the special parts of the Bible. Sometimes it does stand unmistakably for "tomb," although our notions of an artificially prepared grave do not originally belong to it; at other times, it is the abode of disembodied spirits, whether good or evil. It is the place where the dead go to be united with their "people," their "ancestors," friends, and all the departed. It was placed in the center of the earth, or below the ocean, and was a dismal dark place, like the Orcus, or Tartarus. It has gates and bars, it has chambers, valleys, and rivers, and its inhabitants—the shadows—(*rephaim*=feeble ones), who ordinarily enjoy deep repose in this "reign of silence," are troubled by being called up to the surface, or tremble at the arrival of some great tyrant. As the receptacle of all things, it contains the shadows even of trees and kingdoms. It is described as all-devouring, remorseless, and insatiable. There can be no doubt of the existence of an idea—however vague—if not of immortality, in the modern sense, yet of some state after life among the Hebrews, even in the earliest times. For the Gehenna (Ge-Hinom) of the New Test., see HELL. The Old Test. Revision (1885), instead of translating *Sheol*, mostly *transfers* it, avoiding all unwarranted dogmatic implication.

SHEPARD, CHARLES UPHAM, LL.D., b. R. I., 1804; graduated at Amherst college, 1824; studied botany and mineralogy at Cambridge, and taught them at Boston; was assistant to Prof. Silliman at Yale two years, and lecturer on natural history, 1830-47; professor of chemistry and natural history, Amherst, 1845-52; in the medical college at Charleston, S. C., 1854-61; professor of natural history again at Amherst from 1861 to the present time. Prof. S. formed at Amherst a remarkably fine collection of minerals and meteorites; and is author of a treatise on mineralogy, a report on the geology of Connecticut, and many scientific papers. He d. 1886.

SHEPARD, THOMAS, 1605-49; b. England; graduated at Emanuel college, Cambridge, 1627; became a preacher and was silenced for non-conformity; arrived at Boston, 1635; aided in establishing Harvard college, 1636, and became pastor of the church in Cambridge as successor of the Rev. Thomas Hooker, after whom he was esteemed the most learned theologian in New England. Among his writings published during his life are: *New England's Lamentation for Old England's Errors*; *The Sound Believer*; and *Theses Sabbaticæ*. He left also numerous MS. works—some of which have been published in England—and an autobiography, first printed at Cambridge, 1832. An edition of his works, in 3 vols., was published in Boston, 1853.

SHEPARD, WILLIAM, 1737-1817; b. Mass.; was capt. under sir Jeffrey Amherst through the French war, and during the revolution took part in 22 engagements; became a farmer at Westfield, Mass.; as brig.gen. of militia defended the arsenal at Springfield in the Shays insurrection, and was afterward maj.gen. of militia; was a member of the executive council 1788-90, and of congress 1797-1803. In his old age he was very poor.

SHEPHERD-KINGS. See HYKSHOS.

SHEPHERD'S DOG, OR SHEEP DOG, the most useful and valuable of all kinds of dog, and universally employed by shepherds throughout Europe, and in the countries colonized from Europe, and also in some parts of Asia, to assist them in the tending of their flocks. Without it the shepherd would be utterly incapable of taking care of the great number of sheep often under his charge; and the expense of keeping the requisite number of shepherds would far more than take away the profits of sheep-farming. That the dog was employed in the tending of sheep in very ancient times we learn from the allusion to the *dogs of the flock* in Job xxx. 1. Buffon imagined the shepherd's dog to be the original of all the domesticated dogs; but was unable to assign any good reason for such an opinion. The shepherd's dog exhibits nearly the same characters in all parts of Europe, although there are slight diversities in different countries, as between that of England and that of Scotland, there known as the *collie*. It is of middling size—differences of size, however, being among the characteristics of different races; of rather slender form, with a pretty sharp muzzle; the ears erect, or, in some races, drooping at the tip; the

hair soft, long, shaggy, and somewhat waved; the tail slightly pendulous, more or less recurved, and very bushy; the feet well protected by hair, so as to be adapted for rough ground. The eye is very bright and intelligent, although the ordinary demeanor of the animal is remarkably calm and quiet. No kind of dog is more intelligent, and perhaps none so docile. Its ready comprehension of the meaning of its master, its prompt obedience to his word or gesture, its evident knowledge of what is requisite to be done, and the services which it performs can never be observed without admiration. A shepherd's dog exhibits the utmost care to prevent sheep from straying off the road along which they are being driven, and sets itself, often of its own accord, to watch any gate or gap in the fence, or goes immediately to bring back stragglers. It is equally useful on the bleak moor or wild mountain, readily going for sheep, and bringing them from a distance. The sheep become perfectly acquainted with it, and evidently regard it as a friend, and not as an enemy, although the appearance of any other dog would alarm them at once. It knows the sheep of the flock it is required to attend, and even in a crowded market adroitly separates them from others with which they have become mingled. Its remembrance of places is obviously very accurate; and a dog which has found great difficulty in conducting sheep through crowded thoroughfares does the same work much better on subsequent occasions. The intelligence of the shepherd's dog has sometimes been proved in a very remarkable way by dishonest masters employing them to steal sheep; the master merely indicating by some sign the sheep which he wished to add to his own flock, and leaving the dog to do it in his absence. See *illus., Horse, Dogs, AND RABBITS, vol. VII.*

The shepherd's dog is often crossed with other kinds of dog, and particularly with the pointer and setter. Dogs are thus obtained which, whilst capable of all the services required by the shepherd, are equally capable of employment in the pursuit of game.

The *drover's dog* is very often a cross between the shepherd's dog and the mastiff, the foxhound, the pointer, or the greyhound. It displays many of the best qualities of the shepherd's dog, and if too frequently very different from it in its cruel treatment of sheep, the fault is originally that of the brutal master.

SHEPHERD'S PURSE, *Capsella*—formerly *Thlaspi*—*Bursa pastoris*, an annual plant of the natural order *cruciferae*, a most abundant weed in gardens and cornfields in America, and remarkable as one of the few plants that are found over almost the whole world, adapting themselves to almost all soils and climates. It is a very variable plant, from 3 in. to 2 ft. in height, with root-leaves more or less pinnatifid, all the leaves more or less toothed, and rough with hairs. The root-leaves spread closely along the ground. The flowers are white and diminutive. The pouch, from which the English name seems to be derived, is laterally compressed, and somewhat heart-shaped. This is a troublesome weed where it abounds.

SHEPLEY, GEORGE FORSTER, 1819-78; b. Maine; graduated at Dartmouth college, 1837; studied law at Harvard university and at Portland, practiced law at Bangor in 1840. He was U. S. district attorney under Pres. Polk, residing in Portland, and filled the office until 1861. In the war of 1861-1865 he was col. 12th Me. vols., afterwards commanded a brigade in Gen. Butler's expedition. He was placed in command of the city of New Orleans and appointed military governor of Louisiana; held a similar position in Richmond after the surrender in 1865; U. S. circuit judge, first circuit, in 1869.

SHEPPARD, ELIZABETH SARA, 1830-62, English author, who at the age of sixteen published under the pen-name of "E. Berger," the novel *Charles Auchester*, pronounced by Benjamin Disraeli the greatest book that would ever be written on music. This was followed by *Counterparts* (1854); *Almost a Heroine*; *Rumour*; two inferior novels entitled *Beatrice Reynolds* and *The Double Coronet*; a series of juvenile stories, and several songs. The characters in her books are people prominent in her day in music, literature, and public life, barely disguised by fictitious names, Seraphael in *Charles Auchester* being easily recognized as Mendelssohn. See articles on this author in volumes ix. and x. of the *Atlantic Monthly*.

SHEPPARD, JACK (1702-24), a noted English robber, originally a carpenter, but began the career of highwayman in 1720. His history has been popularized by a painting by Thornhill, pantomimes, a history of him by De Foe (1724), a novel by Ainsworth in 1839. He was hanged at Tyburn.

SHEPPEY, ISLE OF, a portion of the county of Kent, insulated from the main-land by the Swale, an arm of the estuary of the Medway, is 9 m. long, and $4\frac{1}{2}$ m. broad. In early times its dimensions were much greater, but the sea has encroached upon, and is gradually eating away, the northern shore, which is lined by cliffs of London clay, from 60 to 80 ft. in height. The church of Minster, formerly in the middle of the island, is now on the n. coast. Great numbers of interesting fossils are found imbedded in the London clay, of which the whole island is composed. Almost the whole of the inhabitants are massed in the seaport of Sheerness (q.v.). Area of island 35 sq. m.; pop. '91, 18,607.

SHEPTON MALLET, a market t. of Somersetshire, 5 m. e.s.e. of Wells. It is a town of considerable antiquity, and is mentioned in *Domesday Book* as Sepeton. Its grammar-school, free to twelve boys, was founded in 1627. Worsted stockings, crape, silk, and velvets are manufactured. It contains several large breweries. Pop. '91, 5,500.

SHER'BET, an oriental beverage, much used in Mohammedan countries, where stimulating drinks are forbidden. It consists of the juices of various fruits diluted with water, and sweetened exactly in the way in which lemonade is made in Europe.

SHERBORNE, a market t. of Dorsetshire, on the river Yeo, 17 m. n.n.w. of Dorchester. The King's school, refounded in 1550, is on the site of the old monastic school. The town was a bishop's see from the 8th to the 11th century. There are several glove manufactories and silk-throwing mills. Pop. '91, 5001.

SHERBROOKE, a co. in s. Quebec, consisting of the townships of Ascot and Oxford; 220 sq. m.; pop. '91, 16,088. It is intersected by the Grand Trunk, the Quebec Central, the Canadian Pacific, and the Boston and Maine railroads. It is drained by the river St. Francis, having valuable water-power, and by the Magog and other small lakes and streams in the w. and s., and lake Memphremagog, bordering on the s.e. Co. seat, Sherbrooke.

SHERBROOKE, city and co. seat of Sherbrooke co., Quebec, Canada; at the junction of the St. Francis and Magog rivers, and on the Boston and Maine, the Canadian Pacific, the Quebec central, and the Grand Trunk railroads; 101 m. e. of Montreal. It contains several banks and insurance companies, is the seat of a Roman Catholic bishop, and has saw and grist mills, breweries, cotton and woolen mills, and manufactories of paper, machinery, flannel and worsted goods, iron castings, cigars, corsets, etc. Pop. '91, 10,110.

SHERBURNE, a co. in e. Minnesota, having the Mississippi river for its s. and s.w. boundary; 424 sq. m.; pop. '90, 5908, chiefly of American birth. It is intersected by the Great Northern railroad. Co. seat, Elk River.

SHERE, or **SHER**, ALI, Ameer of Afghanistan, 1825-79; in 1863 succeeded his father, Dost Mohammed, on the throne. His reign was full of great vicissitudes, and at times was hardly more than nominal, until 1869, when the British influence restored him to full power. During the war with the British, in 1878, Shere Ali left his country, and took refuge among the Russians in Turkestan, where he died.

SHERIDAN, a co. in n.w. Kansas, drained by the Saline river in the s., Prairie Dog creek and the North and Solomon river traversing it latitudinally; 900 sq. m.; pop. '90, 3733. Co. seat, Hoxie.

SHERIDAN, a co. in n.w. Nebraska, drained by Niobrara river; pop. '90, 8687. Co. seat, Rushville.

SHERIDAN, PHILIP HENRY, b. Albany, N. Y., Mar. 6, 1831; graduated at West Point in 1853, and, being assigned to the infantry, served on frontier duty in Texas for nearly two years, and in Oregon, 1855-61. At the commencement of the civil war he was appointed quartermaster of the army of s.w. Missouri, and in April, 1862, chief quartermaster of the western department. In May, 1862, he was appointed col. of the second Michigan volunteer cavalry; was commissioned brig.gen. of volunteers, July 1, 1862; and soon afterward was put in command of the 11th division of the army of the Ohio. He commanded a division in the army of the Cumberland, and at the battle of Stone river, Dec. 31, 1862, saved the army from being routed by his stubborn resistance, for which he was made maj.gen. of volunteers. In the march toward Chattanooga in 1863, he was very active; and in the battle of Chickamauga, though swept off the field by the breaking of the lines, he recovered himself and returned with his own command and some other troops to support Gen. Thomas. In March, 1864, he was called to the army of the Potomac by Gen. Grant. He was given command of the cavalry corps, and during May, June, and July, besides protecting the flanks of the army and reconnoitering the enemy's position, was successfully engaged in eighteen different actions. In Aug., 1864, he was placed in command of the army of the Shenandoah; and soon afterward of the middle military division, gaining several successes over Gen. Early, for which he was made a brig.gen. of the U.S. army, and in the following November maj.gen. After completely crushing Early's army, he desolated the whole region along the banks of the James river, effectually cutting off all supplies for the confederate army from the north. He then made a detour around Richmond joined Gen. Grant's army at City Point, whence he started Mar. 25, 1865, to strike the final blow for the overthrow of Gen. Lee's army of northern Virginia. He fought the battle of Dinwiddie Court-House, Mar. 31; and that of Five Forks, which compelled Lee to evacuate Richmond and Petersburg, April 1. He followed these victories by attacking and harassing the confederate troops during their flight, which led to the surrender of Lee at Appomattox Court-House, April 9, 1865. He was appointed to the command of the military division of the s.w., June 3, and of the military division of the Gulf, July 17; of the department of the Gulf, Aug. 15, 1866; of the fifth military district, including Louisiana and Texas, Mar. 11, 1867; and of the department of the Missouri, with headquarters at fort Leavenworth, Sept. 12. He was made lieut.gen., Mar. 4, 1869, and given command of the division of the Missouri, including the departments of Dakota, of the Missouri, of the Platte, and of Texas, with headquarters at Chicago. He visited Europe in 1870-71. During the political disturbances in Louisiana in 1875, Gen. Sheridan was ordered to

New Orleans, and on quiet being restored returned to his command at Chicago. He assumed command of the army, on the retirement of Gen. Sherman, 1883; died at Nonquit, Mass., Aug. 5, 1888. See *Personal Memoirs* (2 vols., N. Y., 1888).

SHERIDAN, RICHARD BRINSLEY BUTLER, son of Thomas Sheridan, a lecturer on oratory and elocution, in his day of some notoriety; was born at Dublin in Sept. 1751, in due course was sent to school there, and afterward removed to Harrow. He gave no promise as a boy of the brilliancy he afterward displayed as a man, being pronounced a hopeless dunce by all his teachers. He does not seem to have been brought up to any regular employment; and after his elopement and marriage in 1773 with a Miss Linley, a public singer of great beauty and accomplishment, his prospects did not seem bright, more especially as he insisted, on a point of pride, that his wife should give up her profession. As the readiest resource he betook himself to literature. The lighter drama was the sphere which attracted him, and in Jan., 1775, his first comedy, *The Rivals*, was produced. Damned on its first appearance, through certain deficiencies in the acting, this piece on its repetition found gradually the favor with the public which its wit and vivacity deserved, and made the reputation of the writer. In the course of the year following Sheridan followed up his success by a farce of no very great merit, entitled *St. Patrick's Day, or the Scheming Lieutenant*, and a second comedy, *The Duenna*, amid the sparkling dialogue of which are interspersed some songs of exquisite merit. He now became in some unexplained manner—for though his pieces were most successful they could scarcely have brought him the necessary funds—part proprietor of the Drury Lane theater; and in 1777 his *School for Scandal* was produced there. This, which is by much his greatest effort, instantly leaped into the popularity it has ever since continued to retain. His other works for the stage were the inimitably clever farce, *The Critic* (1779), and, after a long interval, *The Stranger* and *Pizarro* (1799), both adapted from the German of Kotzebue. During this interval he was deeply engaged in politics. Sheridan's wit and sprightliness coruscated in society as brightly as they did in his comedies; he was an admirable table-companion—over a bottle the best of then living good-fellows. With Fox and his wild set these gifts made him a prime favorite; and through the influence of Fox it was that in 1780 he was returned to parliament for the borough of Stafford. In his politics he faithfully followed Fox, and the whig party from time to time had good service from their brilliant recruit. He never failed to amuse the house, and when stirred by the trumpet-call of a great occasion, he was capable of rising to heights of noble eloquence. In particular, his famous speech urging the impeachment of Warren Hastings (q. v.), is still traditionally remembered as perhaps the very grandest triumph of oratory in a time prolific of such triumphs.

In 1792 Sheridan lost his wife; and three years after, he was married again to a Miss Ogle, who brought him £5,000, to Sheridan no doubt welcome, though trifling as a relief to the difficulties in which he had become involved, and which more and more continued to accumulate upon him. Always the most reckless and improvident of mortals, he did not improve with time. His later years were years of wretched struggle, of which debt, duns, and dissipation may furnish a convenient alliterative summary. His health failed him with his fortunes; and his friends, not finding him in his sickness and adversity quite so amusing as formerly, naturally failed him also—notably and shamefully, the prince regent, whose dull brains over the wine cup he had many a time been made use of to brighten. Some honorable exceptions there were, among whom the poets Rogers and Moore may be mentioned as steadily kind to him to the last. He died in London on July 7, 1816, in his 65th year.

See his biography by Moore, and (for a just and delicate appreciation of his genius) Hazlitt's *Lectures on the Comic Writers*; also, Stainforth's edition of his works (1874).

SHERIDAN, THOMAS, 1721-88; b. near Dublin Ireland; educated at Trinity college. In 1743 he entered the dramatic profession, played at Drury Lane and Covent Garden; managed the Dublin theater until 1754, when a political riot occurring in the theater compelled him to retire. With the exception of one or two brief re-appearances on the stage, the rest of his life was spent as a lecturer on elocution at Oxford, Cambridge, and elsewhere. He published a *Life of Swift*, a dictionary, and lectures on reading and elocution.

SHERIFF (Arab. noble), designates, among Moslems, a descendant of Mohammed, through his daughter Fatima and Ali. The title is inherited both from the paternal and maternal side; and thus the number of members of this aristocracy is very large among the Moslems. The men have the privilege of wearing green turbans, the women green veils, and they mostly avail themselves of this outward badge of nobility—the prophet's color—while that of the other Moslems' turbans is white. Many of these sherifs founded dynasties in Africa; and the line which, nowadays, rules in Fez and Morocco, still boasts of that proud designation.

SHERIFF (A.-S. *scir-gerēfa*, the reeve or fiscal-officer of a shire; compare Ger. *graf*), in English law, is an officer whose duties are chiefly ministerial (for he has only a few trifling judicial duties). The office is of great antiquity. The sheriff was formerly chosen by the inhabitants, though probably requiring confirmation by the crown. But popular elections for that purpose were put an end to by a statute of 9 Ed. II., which enacted that in future the sheriffs should be assigned by the chancellor, treasurer, and

judges. Ever since that statute, the custom has been, and now is, for all the judges of the common-law courts, with the lord-chancellor, and chancellor of the exchequer, to meet in the court of exchequer at Westminster on the morrow of All Souls, and then and there propose three persons for each county to the crown. This is called the pricking of the sheriffs, and the crown afterward selects one of the three nominated, and appoints him to the office. A sheriff continues in office for one year only, and cannot be compelled to serve a second time. The office is not only gratuitous, but compulsory, for if the person appointed refuses, he is liable to indictment. In practice, country gentlemen of wealth are appointed. In the city of London, the sheriffs are appointed not by the crown, but by the citizens. The sheriff has important official duties in elections of members of parliament. He is, by his office, the first man in the county, and superior to any nobleman while he holds office.

The office of sheriff is one of the few which may be traced back to the Saxon times, and it appears originally to have been the same both in England and Scotland. The sheriff was (under the earl and next to the bishop) the chief man of the shire, and seems to have possessed unlimited jurisdiction to keep the peace; to have presided in all the courts; to have punished all crimes, and have redressed all civil wrongs. This extensive jurisdiction, gradually acquired at the cost of lesser local courts, has been gradually infringed upon, partly by the exercise of the royal prerogative, and partly by parliament. But in England it suffered more from the appointment to the office of men unfit to exercise judicial powers, and from the consequent usurpation of their functions by the supreme courts. The same causes operated in Scotland, though to a less extent. In England, they resulted in the almost entire abolition of the judicial functions of the sheriff. In Scotland, they resulted in his being deprived of the more important parts of the criminal jurisdiction, particularly of the power to punish by death; and in his civil jurisdiction being limited mainly to questions affecting movables. In both countries, the office was usually hereditary, which tended to a separation of the duties of the office into the honorary and the laborious—the former being performed by the principal sheriff, and the latter by the deputy. In Scotland, this separation was completed by the act of George II., which entirely separated the offices, by the transference of the power of appointing the deputy from the principal sheriff to the crown. In England, this complete separation has never become necessary, from the fact of the sheriff's power having been much more crippled than in Scotland. Indeed, in England, so purely honorary and ministerial has the office become, that it has been held by a female, and in Westmoreland, the office was hereditary down to 1849.

In the United States, a sheriff is an officer of the state and county, and not of the general government; he has no judicial functions unless power to assess damages in certain cases with the aid of a jury is considered as such; and he is almost invariably elected by popular vote. The deputies of a sheriff are responsible to him only while he remains responsible to the executive and the public (see OFFICE). The duties and functions of the sheriff are in general much the same in this country as in England.

SHERIFF-MUIR, a name given to several moors in Scotland on account of the "wapinschaws" which used to be there held, under the superintendence of the sheriff. The only moor of this name which appears prominently in Scottish history is situated in Perthshire, on the northern slope of the Ochils, 2 m. n.e. of Dunblane, and was the site of the great battle between the adherents of the houses of Stuart and Hanover, Nov. 13, 1715. The former, who consisted of the northern clans under the earl of Seaforth, and the western clans under Gen. Gordon, numbering about 9,000 in all, were on their march southward, under the leadership of the earl of Mar, to join the Jacobites who had risen in the n.w. of England, when they were met by the duke of Argyle at the head of 3,500 disciplined troops. After lying under arms all night, the Macdonalds, who formed the center and right of the Highland army, attacked the left of their opponents, and routed it so completely that the fugitives fled with all speed to Stirling, carrying the news that Argyle had been totally defeated. Argyle, however, with his dragoons had meantime driven the left of the Highlanders back for 2 m., when the right and center returned from the pursuit, and took him in rear; he then skillfully withdrew his men to a place of shelter, and remained facing his opponents till the evening, when he retired to Dunblane, and next day to Stirling. About 500 were slain on each side. As a mere battle, the victory lay with the Highlanders; but it was so little decisive, that it paralyzed the action of the Jacobites almost as effectually as a defeat would have done.

SHERLOCK, THOMAS, D.D., an English prelate, was the son of Dr. William Sherlock, dean of St. Paul's, and was born in London in 1678. He was educated at Eton and Catharine hall, Cambridge, where he took the degree of M.A. in 1701. In 1704 he obtained the mastership of the temple; in 1714 he became vice-chancellor of his college, taking the degree of D.D. in the same year; and in 1716 dean of Chichester. Eleven years later he was raised to the see of Bangor, was transferred to that of Salisbury in 1734, and in 1748 to that of London. He died in 1761. Sherlock was a strenuous tory, and supported the church-and-state politics of his day with a sort of dull dignity. He displayed a good deal of diplomatic skill in his different official positions, whence Bentley nicknamed him "Cardinal Alberoni;" his eloquence and learning were likewise of a very superior order, as may still be ascertained from his 4 vols. of *Sermons* (1755-76), which were highly praised in their day.

SHERLOCK, WILLIAM, D.D., 1641-1707; b. London; graduated at Cambridge and became rector of St. George's parish, London, 1669; was made a prebendary in St. Paul's, master of the temple, and rector of Therfield. After the revolution he was suspended for refusing the oath of allegiance to William and Mary, but afterward took it, defending himself by publishing the *Allegiance of the Two Sovereign Powers*, to which the replies were almost innumerable. In 1691 he became dean of St. Paul's.

SHERMAN, a co. in n.w. Kansas, having the state line of Colorado for its w. boundary; 1080 sq. m.; pop. '90, 5261. Co. seat, Goodland.

SHERMAN, a co. in central Nebraska, drained by the Loup fork of the Platte river, and other streams; 576 sq. m.; pop. '90, 6399. Co. seat, Loup.

SHERMAN city and co. seat of Grayson co., Tex.; on the Houston and Texas Central, the Missouri, Kansas, and Texas, the St. Louis Southwestern, and the Texas and Pacific railroads; 64 miles n. of Dallas. It is the seat of Austin college (Pres.), North Texas female college (Meth. Epis.), Mary Nash college, Burdette college, and St. Joseph's and Le Tellier academies, and has electric lights, waterworks supplied from deep wells, cotton seed oil mill (cost \$500,000), three cotton gins, three flour mills, iron foundries and machine shops, cotton compress, seamless bag factory, planing mills, marble and brick works, and carriage and wagon factories. Pop. '90, 7,335.

SHERMAN, FRANK DEMPSTER, was born at Peekskill, N. Y., May 6, 1860. He studied at Columbia and Harvard University; and was elected fellow of Columbia in 1887, and became instructor in the Columbia School of Architecture. He has written *Madrigals and Catches* (1887); *Lyrics for a Lute* (1890); and, with John Kendrick Bangs, *New Waggings of Old Tales* (1888).

SHERMAN, JOHN, b. Ohio, 1823; brother of Gen. W. T. Sherman; studied law; admitted to the bar in 1844, elected a member of the 34th, 35th, and 36th congresses. In 1860 he was again elected to the house of representatives, but was made senator from Ohio in the following year, and re-elected for the two following terms. On the accession of President Hayes, Senator Sherman was appointed to a place in the cabinet as secretary of the treasury, in which position he had the satisfaction of superintending the resumption, by the government, of specie payments, Jan. 2, 1879, after a suspension of 17 years. In the exciting campaign for president in 1880, Secretary Sherman was a prominent candidate for nomination by the republican party at the convention held at Chicago in June; but it becoming apparent that his nomination was impossible, owing to the formidable strength of the friends of Gen. Grant, a combination was effected between the Sherman and Blaine parties in the convention, and the compromise pursued which resulted in the nomination of Gen. Garfield. On Mar. 4, 1881, Mr. Sherman took his seat as U. S. senator from Ohio. A leading candidate for the presidential nomination, 1888, he was defeated only by the transference to Harrison of the Blaine vote. His *Reminiscences* were published in 1895. For an account of the coinage bill which bears his name, see MONEY.

SHERMAN, ROGER, 1721-93; b. Mass.; a shoemaker, who in 1743 settled in Connecticut, where he was a store-keeper. He became county surveyor of lands in 1745; but taking up the study of law, was admitted to the bar in 1754. He served a number of terms in the assembly, became a judge of the court of common pleas in 1759, and was appointed to the same office 6 years later at New Haven, whither he had removed in 1761; and he held the office till 1789, part of the time sitting on the superior court. He was a member of congress from 1774 till his death, one of the committee of 5 appointed to draft the declaration of independence, a member of the boards of war and ordnance, and of several important committees. He helped codify the laws of Connecticut, and to draw the articles of confederation; was a member of the constitutional convention of 1787, U. S. senator, 1791-93, and mayor of New Haven from 1784 to his death. He was a man of strong practical sagacity.

SHERMAN, SIDNEY, 1805-73; b. Mass.; lineally a descendant from Roger Sherman; received a common school education; established himself in business in New York, but removed thence to Cincinnati, Ohio, in 1831, and again to Newport, Ky. In 1835 he raised a company to aid Texas in her struggle for liberty and independence, equipping his men and supplying two pieces of artillery. He was engaged in the conclusive battle of San Jacinto, in which he commanded the left wing of the Texan force, and first raised the exciting battle-cry "Remember the Alamo!" In 1837 he removed to Texas, and five years later was sent to congress from Harris co., that state. He planted the first railroad on Texas soil in 1854. During the war of the secession he organized the defense of Galveston.

SHERMAN, THOMAS WEST, 1813-79; b. Rhode Island; graduated at West Point in 1836; commissioned 2d lieutenant in 3d artillery. He was engaged in the Mexican war, and was made brevet-major for gallant conduct at the battle of Buena Vista. At the outbreak of the civil war he was appointed lieutenant-colonel of the 5th artillery, but in 1863 returned to the 3d artillery as its colonel. He was made brigadier-general of volunteers; commanded the land forces in the operations against Port Royal and the Sea islands in Oct., 1861; and in December of the same year occupied Beaufort and Tybee island. He was under

Gen. Banks at Port Hudson in 1863, where he lost a leg. In 1870 he was placed on the retired list with the full rank of maj.gen. in the U. S. army.

SHERMAN, WILLIAM TECUMSEH, an American general, was born in Lancaster, Ohio, Feb. 8, 1820. He was the son of Charles R. Sherman, a lawyer, and Mary Hoyt, both of Norwalk, Conn., and descended from Hon. Samuel Sherman, brother of Rev. John (q.v.), emigrants from Dedham, England, in 1634. From Capt. John Sherman, a cousin of Samuel's, are descended Roger Sherman, a signer of the Declaration of Independence, William M. Evarts, Ex-Senator Hoar, and many others of national fame. Charles Sherman died in 1829, and the family of ten children were scattered, William going to live with Hon. Thomas Ewing. In 1836 he received an appointment to West Point and graduated in 1840. The same year he was commissioned second lieutenant of the Third Artillery, and sent to Florida. In 1847 he was sent to California, where he was assistant adjutant general until 1850. In 1853 he resigned from the army and entered the banking business in San Francisco, afterwards removed to New York, practised law for a time in Kansas, and in 1858 was President of the Louisiana Military Academy. In 1861 he left the South and went to St. Louis, but was soon called upon by President Lincoln to return to the army, being first commissioned Colonel of the Thirteenth Regular Infantry, and a few weeks later brig. general of volunteers, and was in command of a brigade at the first engagement at Bull Run. A few weeks later, at General Anderson's request, he was appointed to that officer's staff in the Department of the Cumberland, and on the failure of the General's health in October, succeeded to the command. It was while in this position that Sherman realized the magnitude of the war, and when asked by the secretary how many men he needed, replied, "200,000 to finish the war in this section." This remark was taken up by the press and he was charged with insanity, finally removed from command with orders to report to General Halleck in St. Louis. In February, 1862, he was ordered to the command of the district of Paducah, Kentucky, and in April was in the battle of Shiloh (q.v.), at which he was wounded in the hand, and had three horses shot from under him. He displayed such energy and skill, that Grant, in a letter to the War Department, said of him: "To his individual efforts I am indebted for the success of that battle." Soon after he was commissioned major-general of volunteers, and took a prominent part in the siege of Corinth. In July he was placed in command at Memphis, and in December was ordered to the mouth of the Yazoo, to take Vicksburg from that direction. This was unsuccessful, but he rendered important service in Mississippi in April and May, 1863. In July he was with Grant at the siege of Vicksburg, and marched against Johnston, driving him out of Jackson a few days later. Soon after this he was made brigadier-general of the regular army. In October he was appointed commander of the Department of the Tennessee, and by making rapid marches he soon joined Grant at Chattanooga, doing important work at Missionary Ridge, and compelling General Longstreet to raise the siege of Knoxville and retreat to Georgia. Sherman then returned to Vicksburg, making various important movements, the most important, perhaps, being the cutting of the railroad lines centring in Meridian, Miss. When Grant was appointed commander-in-chief of the armies of the U. S. in March, 1864, Sherman was given the command of all the armies between the Mississippi River and the Alleghany Mountains, with instructions to move against General Johnston stationed at Dalton, Georgia. He organized at Nashville an army comprising 100,000 men, with which he undertook his invasion of Georgia. He fought the confederates under Gen. Joseph E. Johnston at Dalton, Resaca, Cassville, Dallas, and in the Kenesaw mountains, from May 12 to the beginning of July, when he occupied Marietta, and defeated Gen. Hood, who had superseded Johnston, in several hard-fought battles, winding up his triumphant campaign Sept. 1, when Atlanta was evacuated after a siege of 40 days; on Aug. 12 he was commissioned maj.gen. in the regular army. Gen. Sherman now rested his army until November, when he undertook the "march to the sea" which has chiefly perpetuated his fame. On Dec. 13 he was at Savannah, when he stormed fort McAllister and captured the city. Making the latter his base for future operations, he marched into South Carolina, capturing Columbia, Feb. 17, 1865; Cheraw, Mar. 3; and, continuing into North Carolina, fought battles at Averysboro and Bentonville, and captured Goldsboro on Mar. 23. He took Raleigh, April 13, and on the 26th received the surrender of Gen. Joseph E. Johnston at Durham Station. He continued his march to Richmond and Washington, where it concluded May 24, having extended over 2600 miles. This march has been represented by writers of the Confederate side as one of lawlessness and inhumanity, but such outrages as were committed were mostly of them the work of the so-called "bummers" or followers in the rear of the army, and were without Sherman's knowledge and contrary to his instructions. He says in his *Memoirs* that "while such public buildings as could be converted to hostile uses were totally destroyed, little or no damage was done to private property." After the grand review in Washington, his army was disbanded. In 1866 he succeeded Gen. Grant as lieutenant-general, and on Grant's becoming president, was made general of the army, retiring from active duties in 1883. In 1871 he made a tour through European and Oriental countries, and was everywhere received with distinction. The last years of his life were spent in New York, where he died in Feb., 1891. See his *Revised Memoirs* published in 1891.

SHERRING, M. A., 1826-80; b. England; ordained in 1852; went to Benares, northern India, as a missionary of the London missionary society, 1853; was stationed at Mirzapore in 1856; returned to Benares in 1861, where he remained until his death. He visited England in 1867 and 1876. He published, *The Indian Church during the Mutiny; The Sacred City of the Hindus; The Tribes and Castes of India as Represented in Benares; The History of Protestant Missions in India.*

SHERRY. See WINE.

SHERWIN, THOMAS, LL.D., 1799-1869; b. N. H.; graduated at Harvard college in 1825; was principal of an academy at Lexington, Mass., 1825-26; tutor at Harvard, 1826-27; spent several months in engineering and surveying; taught a private school for boys in Boston for a year; and afterward had charge of the Boston English high school; was one of the founders of the American institute of instruction in 1830. He published an *Elementary Treatise on Algebra; Common School Algebra.*

SHERWOOD, MARY MARTHA (BUTT), 1775-1851; b. England; educated by her father, the Rev. Geo. Butt. Her first book was published, against her wishes, when she was 17 years of age. She married Capt. Henry Sherwood; resided in India, 1804-18, and afterwards in England. She wrote 90 volumes, including stories for children, novels, and works of laborious research. Among the best known are: *Little Henry and his Bearer; Roxobel; and The Lady of the Manor.*

SHERWOOD, WILLIAM HALL, pianist, b. in Lyons, N. Y., Jan. 31, 1854. He studied under William Mason, under Kullak, Wuerst, Richter, and Liszt in Germany, and played successfully in Europe. In 1876 he returned to the United States and settled in Boston, where he became connected with the New England Conservatory of Music. In 1889 he removed to Chicago to become director of the pianoforte department of the Conservatory of Music. Mr. Sherwood is one of the members of the American College of Music, and has labored to encourage American music. He has written several compositions for the pianoforte.

SHERWOOD FOREST, a stretch of hilly country in the w. of Nottinghamshire, lying between Nottingham and Worksop, and extending about 25 m. from n. to s., and 6 to 8 m. from e. to west. It was formerly a royal forest, and the traditional scene of many of the exploits of the famous Robin Hood and his followers; but it is now almost wholly disafforested, and is occupied by gentlemen's seats and fine parks. The town of Mansfield and a number of villages are situated within the ancient bounds. Numerous remains of the old forest are still to be seen.

SHET LAND, ZETLAND, or anciently **HIALTLAND**, and likely the ultima thule of the Romans, a group of about 100 islands, islets, and rocks, 23 of which are inhabited. They lie between the Atlantic and the North sea, between lats. 59° 50' and 60° 52' n., and between longs. 0° 53' and 1° 15' w.; but Fair isle, which belongs to Shetland, lies to the s., and is about midway between Orkney and Shetland. The group is about 50 m. n.e. of Orkney, and 210 m. w. of Norway. Area, 551 sq. miles. The largest is Mainland; others are Unst, Fetlar, Bressay, Whalsay, Papa Stour, Barra, and Foula. Pop. in 1811, 22,379, and in '71, 31,608, with 141.2 females to every 100 males, and 5667 inhabited houses. In '91, the population of the group was 28,711. Lerwick, on Mainland, 272 m. n. of Edinburgh, and 95 n. of Wick, is the chief town of Shetland, and has a custom-house, law courts, and other public offices. Its pop. in '91 was 3783. It has a fine natural harbor, and has steam communication with Granton for passengers, mails, and a large part of the exports from and imports into Shetland. Fort Charlotte, now used as a prison, court-house, etc., is at the n. end of the town, and adds to its picturesque-ness. Lerwick has hotels, licensed public-houses, and several lodging-houses. The chief imports are oatmeal, flour, tea, tobacco, spirits, sugar, cottons, woolens, timber (chiefly from Norway), tar, salt, etc. The manufactures are chiefly hosiery and shawls, and the exports, besides these, are cattle, fish, and eggs.

Fishing for cod, ling, herring, is the chief industry, giving employment to about 300 fishing-boats, with 7500 fishermen and boys. Much attention is given to the rearing of cattle, sheep, and ponies, the little Shetland ponies being famous throughout the world. Almost all the small tenants practice spade cultivation. Seals and bottle-nosed whales are often caught. The spinning-wheel is common, but the spindle is still in use in some parts. The sheep and ponies run at large on the scatfield or common, and have registered marks; but many large tracts have been inclosed and drained, and now rear first-class cheviot and black-faced sheep. The *riolin*, a sandal of untanned leather, is still worn. Some lands are still held runrig, and some islanders on the w. still hold their stock as steel-bow. In certain districts, till a very late period, the poor, by the Norse law, went from house to house, and stayed a longer or shorter period in each, according to the size of the farm. The Shetland dialect is a soft and pleasant English, but contains many peculiar Norse words. Many of the people still eat their fish wind-dried and slightly tainted. Young men from Shetland are employed as sailors in the Peterhead and Dundee whalers, or at some of the large shipping ports of the kingdom. They are intelligent, sober, and sedate, and are much liked as seamen. Shetland is still subjected to the *truck* or barter system in local commercial transactions.

Shetland with Orkney forms a county, which sends one member to parliament. In 1893 Shetland had 5445 horses, 18,876 cattle, 99,699 sheep, and 2904 pigs; 9438 acres in oats and barley, the only grain crops; 3267 acres in potatoes, and 1452 acres in turnips. Free landed property is termed udal, and the proprietor an udaler.

The surface is rugged and wild, and often sterile. The coasts are abrupt, and cut with deep bays or voes, and caves. The rocks are mainly gneiss, clay-slate, sandstone, granite, sienite, mica-slate, serpentine, and diallage. The highest hills are Ronas, 1500 ft., and one of five in Foula, 1400. The coast cliff scenery is very fine, and none in Scotland surpasses that about Papa Stour. The climate is moist and variable, and snow and frost are of short duration. South-w., s., and n. winds prevail.

Though we know little or nothing of the original inhabitants of Shetland, the physiognomy, character, and language of the present point to a Norse or Scandinavian descent. In Unst, etc., have been found cairns over long and short stone coffins, with skeletons, clay urns, weapons, and stone vessels. Tumuli and burned stones and earth are frequent, and contain remains of rude buildings and stone implements. Circular strongholds of unhewn stone, called burghs or "broughs," are very numerous, generally on a cliff or headland, but also on artificial islands in fresh-water lochs. Mouse isle has the most perfect "brough" known. In Sandsting occur very rude underground houses, with the rudest stone implements. In Bressay was found a stone of the Christian period, with an Ogham inscription. Monoliths are rather frequent. Stone circles are rare, and never large.

SHEVCHENKO, TARAS GRIGOROVICH, a noted writer of Little Russia, b. Feb. 25, 1814, in the government of Kiev. In the face of every disadvantage he managed to pick up an education. Having shown a talent for painting, he was apprenticed to a house decorator, with whom, in 1832, he moved to St. Petersburg. In this city he became acquainted with a number of poets, who recognized in him a taste for poetry and secured his freedom. In 1847, on account of certain writings which displeased the government, he was banished, and for ten years lived among the soldiers of the Russian army. His release was secured but he died in St. Petersburg, Feb. 26, 1861. Among his writings are *Kolzar* (1840); *Hasidamaki* (1841); *Hamalia* and *Maiak*.

SHEW-BREAD, "bread of the presence," in the Jewish ritual; 12 loaves of unleavened bread, sprinkled with frankincense and placed in the "holy place," on a table of acacia wood overlaid with gold. They were exchanged for fresh loaves every Sabbath, and, after the incense on them had been burned as an oblation, were eaten by the priests. Yet in extreme cases they might be given to hungry men. Wine was placed on the table with the bread.

SHIAHS, or **SHEEAHS**. See **SHITES**.

SHIAWASSEE, a co. of s.e. Mich., intersected by the Shiawassee river, drained also by the Looking-Glass and Maple rivers, and intersected by the Detroit, Grand Haven, and Milwaukee, and the Michigan Central railroads; 528 sq. m.; pop. '90, 30,952. Its surface is undulating and extensively covered with forests of oak, ash, beach, and sugar-maple. Soil sandy but fertile, producing wheat, maize, oats, and hay. Co. seat, Corunna.

SHIB BOLETH (Heb. ear of corn, or stream), the test-word used by the Gileadites, under Jephthah, after their victory over the Ephraimites, recorded in Judges xii. 6. It appears that the latter could not pronounce the *sh*, and, by saying sibboleth, betrayed themselves, and were slaughtered mercilessly. It may be noticed that all those Hebrew names in the Old Testament which commence with the *sh*, have now, through the inability of the Septuagint to render this sound in Greek, become familiar to us through the versions that flowed from it, as beginning with the simple *s*, e.g., Sem, Simon, Samaria, Solomon, Saul, etc. The word sibboleth is used in modern languages in the sense indicated: viz., a test of speech and manners of a certain party or class of society.

SHIDZUOKA, a city in Suruga province, Japan, formerly called Sumpu or Fuchiu, noted even in mediæval times. Iyéyasu, the great unifier of Japan, made it the capital of his fief, and after establishing his family in Yedo, made it the seat of his labors for the revival of literature and the arts of peace, 1604-16, during which time many Europeans visited the city and described it in their works. In 1868 the tycoon and his followers were ordered to make this city, their former ancestral home, their abiding place, its name Fuchiu being changed to Shidzuoka, which means Peaceful Slope. The surrounding region is the richest tea-district in Japan. Inlaid lacquer-work and split ware are largely manufactured. Looming before the city is the sacred Fujiyama. Six miles distant is the famed Kuno San, and the sea-port of Shimidzu. Christian churches and flourishing schools on the American plan attest the influence of the teachers from the United States who have resided there.

SHIEL, LOCH, in the w. of Scotland, forms part of the boundary between the counties of Argyle and Inverness, separating the district of Moidart on the n. from those of Sunart and Ardgower on the south. The head of the loch is about 16 m. w. of Fort William. It is 17½ m. long, and about 1 m. broad, and communicates with the sea by Shiel Water and loch Moidart.

SHIELD, a piece of defensive armor, borne on the left arm, to ward off the strokes of the sword and of missiles. It has been constantly used from ancient times through the middle ages, till the invention of fire-arms rendered it useless. The large shield worn by the Greeks and Romans (Gr. *aspis*, Lat. *clipeus*) was circular, and often ornamented with devices. Another form of shield (Lat. *scutum*) was used by the Roman heavy-armed infantry, square, but bent to encircle the body. The early shield of knightly escutcheon of the middle ages was circular in outline, and convex, with a boss in the center; the body generally of wood, and the rim of metal. In the 11th c., a form came into use which has been compared to a boy's kite, and is said, with some probability, to have been brought by the Normans from Sicily. It was on the shields of this shape that armorial designs were first represented. These shields were in reality curved like the Roman *scutum*; but after heraldry began to be systematized, we generally find them represented on seals, monuments, etc., as flattened, in order to let the whole armorial design be seen. In the 13th c., this long and tapering form began to give place to a pear-shape, and a triangular or heater-shape. During the 14th c., these new forms became more generally prevalent, and the heater-shape, which was perhaps most frequently represented on armorial seals, began to approach more to an inverted equilateral arch. The same variety of forms, with some modifications, continued during the 15th c., a tendency appearing in all representations of the heater-shaped shield to give it more breadth below. A notch was often taken out in the dexter chief for the reception of the lance, in which case the shield was said to be *à bouche*. Subsequent to the middle of the 14th c., when the shield came to be depicted as surmounted by the helmet and crest, the shield is often represented *couché*, that is, pendent from the corner, an arrangement said to have originated in the practice of competitors hanging up their shields prior to a tournament, where, according to De la Colombière, if they were to fight on horseback, they suspended it by the sinister chief, and if on foot, by the dexter chief. A square shield denoted a knight-banneret. Shields of arms were often represented as suspended from the *guige*, or shield-belt, which was worn by the knights to sustain the shield, and secure it to their persons.

After the introduction of fire-arms made shields no longer a part of the warrior's actual equipment, the form of the shields on which armorial bearings were depicted, on seals, monuments, brasses, etc., varied greatly in form, and generally speaking, became gradually more tasteless, fanciful, and unmeaning. A tendency has, however, been shown in recent heraldry to recur to the artistic forms prevalent in the 14th and 15th centuries.

In early times, shields of the form which generally prevailed at the period were exhibited on the seals and monuments of ladies; but about the 15th c., the practice began, which afterward became usual, of unmarried ladies and widows (the sovereign excepted) bearing their arms on a lozenge instead of a shield.

The heraldic insignia of towns, corporations, etc., as well as individuals, are placed on shields. The bearing of merchants' marks (q.v.) in a shield was prohibited by the heralds of the 16th c. under severe penalties. See illus., **HERALDRY**, vol. VII., also **ANCIENT ARMOR**, vol. I.

SHIELDS, CHARLES WOODRUFF, D.D., b. Ind., 1824; grandson of Patrick Henry Shields; graduated at the college of New Jersey, 1844, and at Princeton seminary, 1847; pastor of First Presbyterian church, Hempstead, L. I., 1849-50; and of the Second Presbyterian church, Philadelphia, 1850-65; professor of the relations of religion and science in the college of New Jersey from 1865. He has edited *The Book of Common Prayer*, as amended by the *Westminster Divines*; and is author of *Philosophia Ultima*, a work of extensive scope and deep reasoning; *Final Philosophy*, *Order of the Sciences*, *The Historic Episcopate* (1894); *The Question of Unity* (1894), etc.

SHIELDS, JAMES, 1810-79, b. Ireland; came to this country in 1826; practiced law at Kaskaskia, Ill., 1832; member of the legislature, 1836; state auditor, 1839; judge of the supreme court, 1843; commissioner of the general land office, 1845. He served in the Florida war and in Mexico; brevetted for gallantry at Cerro Gordo, and Chapultepec, severely wounded at both places. He was governor of the territory of Oregon, 1848; U. S. senator from Illinois, 1849-55; removed to Minnesota and was senator from that state, 1858-60. From there he went to California, returned during the war, and took command of Gen. Lander's division at his death; was wounded at the battle of Winchester. He was appointed U. S. senator from Missouri in 1879 to fill out the unexpired term of David H. Armstrong.

SHIELDS, NORTH, a seaport of Northumberland, on the n. bank of the Tyne, and at the mouth of that river, opposite South Shields, and 8 m. e.n.e. of Newcastle. It stretches more than a mile along the river-bank, and is rapidly extending westward. Possessing all the usual institutions, as churches, schools, theater, custom-house, sailors' home, etc., it is not distinguished by any striking architectural features, and it is indebted to its rising trade and manufactures for its importance. Coal and coke are exported and timber, grain and esparto grass are imported. North Shields has two docks, one of 55 acres and the other of 24 acres. The total tonnage entering and clearing the ports of North and South Shields in 1893 was 3,540,869. The building of wood and iron vessels, and tug-steamers, the manufacture of the anchors, chain-cables, ropes, blocks, masts, and other articles of ship-furniture, are the principal branches of industry. North Shields

has an extensive public free library and news-room. It forms part of the borough of Tynemouth. Pop. of borough of T., '91, 46,267; of North S., about 6,000.

SHIELDS, PATRICK HENRY, b. in Va., May 16, 1773, studied law at Hampden-Sidney and William and Mary colleges. He moved to Indiana territory and became first judge of Harrison co. in 1808. He was a member of the constitutional convention at Corydon in 1816. He was active in every branch of the organization of the state. He died June 6, 1848.

SHIELDS, SOUTH, a county, municipal and parliamentary borough, and market t. of Durham, on the s. bank of the Tyne, and at the mouth of that river, 9 m. e.n.e. of Newcastle by river and railway. The town stretches for 2 m. along the side of Shields harbor, which is lined with numerous dockyards and manufactories. The Tyne dock, containing 50 acres of water space, and fourteen other docks are within the borough. In 1854 work was begun on the south pier, which is to be a breakwater about a mile in length, and in 1895 it had not yet been completed. The market-place is a spacious square in the center of the town, near which is the large church of St. Hilda. The town, with North Shields, is one of the chief ports in the kingdom for the building of iron ships, iron screw-steamers, and tug-steamers. There are large alkali, bottle, and glass works, and every kind of manufacture connected with shipping. A steam-ferry for passengers and carriages plies day and night between the two towns, one on the n., and the other on the s. side of the entrance to the Tyne. Shields bar has been removed by dredging, in order, with the piers, to form a harbor of refuge. The sea-coast in the neighborhood is interesting from the rocks and caves. The lifeboat is a South Shields invention. South Shields sends one member to parliament. South Shields possesses a large public library, with news-room, and large hall for public meetings, a marine school, and a park of 45 acres. There is an extensive colliery, that of St. Hilda's; a school-board; and Tyne pilotage board, comprising representatives of North Shields, South Shields, and Newcastle. A large new theater has recently been erected. Pop. '61, 35,239; '91, 78,431.

SHIITES ("sectaries," from the Arab. *shiah*, *shiat*, a party, a faction), the name given to a Mohammedan sect by the "Sunnites" (q.v.), or orthodox Moslems. The Shiites call themselves "followers of Ali," and have special observances, ceremonies, and rites, as well as particular dogmas of their own. The principal difference between the two consists in the belief of the Shiites that the imamat, or supreme rule, both spiritual and secular, over all Mohammedans, was originally vested in Ali Ibn Abi Taleb, and has been inherited by his descendants, to whom it legitimately now belongs. The Persians are Shiites; the Turks, on the other hand, are Sunnites; and this division between the two nations dates chiefly from the caliphate of Mothi Lilla, the Abasside, in 363 H., when political dissensions, which ended in the destruction of Bagdad and the loss of the caliphate of the Moslems, assumed the character of a religious war. The Shiites themselves never assume that (derogatory) name, but call themselves *Al-Adeliat*, "Sect of the Just Ones." They are subdivided again into five sects, to one of which, that of Haidar, the Persians belong; the present dynasty of Persia deriving its descent from Haidar, a descendant of Ali. Ali himself is by some of them endowed with more than human attributes. The Shiites believe in metempsychosis and the descent of God upon his creatures, inasmuch as he, omnipresent, sometimes appears in some individual person, such as their imams. Their five subdivisions they liken unto five trees, with seventy branches; for their minor divisions of opinions, on matters of comparatively unimportant points of dogma, are endless. Yet in this they all agree, that they consider the caliphs Abu Bekr, Omar, and Othman, who are regarded with the highest reverence by the orthodox Sunnites, as unrighteous pretenders and usurpers of the sovereign power, which properly ought to have gone to Ali direct from the prophet. For the same reason they abominate the memory of the Ommayad caliphs, who executed Husain, a son of Ali, and they still mourn his death at its anniversary. They likewise reject the Abasside caliphs, notwithstanding their descent from Mohammed, because they did not belong to Ali's line.

SHIKARPUR, an important trading t., and probably the most populous t., in Sinde, in lat. 27° 57' n., long. 68° 45' e., half way between Multan and Kurrachi. The district in which it stands is so low and level that, by means of canals, which are supplied from the Indus, it is flooded every season. Its climate, notwithstanding, is said to be not unhealthy. The inundated quarters are extremely fertile and produce great crops. Shikarpur is situated on one of the great routes by the Bolan pass from Sinde to Afghanistan, and the transit trade to that country and to Khorassan is important. The bankers and financiers of Shikarpur are known and trusted from Astrakhan to Calcutta. There are manufactures of carpets and a coarse cotton cloth. Shikarpur is the chief town of the district of the same name, which has an area of about 10,000 sq. m. and, '81, 852,986 inhabitants. Pop. of the town, '91, 42,004, — 25,846 of whom were Hindus, and 16,113 Mohammedans.

SHILKA. See AMOOR.

SHILLABER, BENJAMIN P., b. N. H., 1814; was a printer at Dover, N. H., in 1830, and in 1837 went to Demerara, Guiana, as a compositor, and remained there three years. From 1840 to 1847 he was in the printing office of the *Boston Post*, and after that time for three years was connected with the same paper editorially. It was at this period that he wrote over the name "Mrs. Partington" and gained a reputation as a

humorist by the quaintness of his style and matter. Between 1850 and 1853 he tried his hand at newspaper proprietorship, in the *Pathfinder* and *Carpet-Bag*, but returned to the *Post*, 1853-56. From 1856 he was for ten years one of the editors of the Boston *Saturday Evening Gazette*. Shillaber wrote *Rhymes with Reason and Without*; *Poems*; *Life and Sayings of Mrs. Partington*; *Knitting-Work*, and other volumes. He d. 1890.

SHILLELAH is the Irish name of an oaken cudgel or sapling said to be taken from the forest of *Shillelah*, Ireland, famous for its oaks; hence, any stick or club used for cudgeling.

SHILLIBEER. See OMNIBUS.

SHILLING, the name of a money in use throughout many European states, partly as a coin and partly as a money of account. In all probability the name, as well as the thing itself, is derived from the Roman *solidus*, which, with other remains of Roman institutions, was adopted by the Franks and other Germanic nations. See PENNY, SOLIDUS. Others give more fanciful derivations, as from *schellen*, to ring, on account of the particularly clear ring of the coin, and from St. Kilian, whose effigy was stamped on the shillings of Würzburg. The *solidus-shilling* of the middle ages has suffered various degrees of diminution in the different countries. Thus the English silver shilling is $\frac{1}{20}$ of a pound sterling; the Danish copper one is $\frac{1}{16}$ of a ryks-daler, and $=\frac{1}{4}$ d. sterling; and the Swedish shilling is $\frac{1}{16}$ of a ryks-daler, $=\frac{1}{4}$ d. sterling. In Mecklenburg, Sleswick-Holstein, Hamburg, and Lübeck the shilling is used as a fractional money of account (the $\frac{1}{10}$ of a mark, $\frac{1}{18}$ of a thaler), and as small silver change (each coin being a shade less in value than 1d. sterling). The French *sou* is another representative of the solidus. See POUND, MINT.

SHILOH, a city of Ephraim, on a hill n. of Bethel and e. of the great northern road; the abode of the tabernacle and ark from the conquest to the death of Eli, after which it sank into insignificance, and is several times spoken of in Scripture as having been visited with judgments from God because of the iniquities committed there while it was the place consecrated to his worship. Dr. Robinson identified it with Seilun.

SHILOH, BATTLE OF. So named from a church situated where the battle was fought, near Pittsburgh Landing, Hardin co., Tenn., on the Tennessee river, April 6-7, 1862. Gen. Grant, who was in command of the union forces, had about 32,000 men; and Gen. Albert Sidney Johnston, with about 50,000 confederates, marched up from Corinth and attacked on the morning of the 6th with his entire force, driving the federals toward the landing. Gens. W. T. Sherman and Prentiss suffered greatly in this attack, the latter losing three entire regiments. Gen. Johnston was killed by a rifle-ball on this the first day of the fight, and the command fell to Gen. Beauregard, who continued vigorously the attack, directing it mainly toward the center and left of the union army. This portion of the line of defense being protected by a heavy concentrated fire of artillery, and covered by two gun-boats in the river, the attack was repulsed, and the confederate line fell under such heavy fire at night that it was forced to retire. In the mean time Gen. Buell had come up with reinforcements to the extent of about 30,000 men, and these crossed the river during the night. The battle was reopened on the morning of the 7th by a heavy artillery fire from the union batteries, and on the confederates falling back, an assault was made and a general engagement ensued, which continued with great fierceness until late in the afternoon, when the confederates finally retired discomfited. The union loss was 1700 killed, 7,495 wounded, 3,022 prisoners; total, 12,217. Confederate loss: 1728 killed, 8,012 wounded, 959 missing; total, 10,699.

SHIMONOSEKI, a seaport town of Japan, at the extreme s. end of the province of Nagato (Choshu), commanding the narrow straits of the same name; lat. 33° 56' n., long. 131° e.; pop. '92, 33,592. It is the terminus of the great high road that traverses the entire main island, and the entrepôt of a bustling junk and steamer trade. It is surrounded by high hills. In 1185 the naval battle, in which 1200 war junks were engaged and the Taira army was annihilated by the Minamotos, was fought off the town. In 1863 the daimio of Choshu and his retainers erected forts on the bluffs, and refused to allow foreign vessels to pass through the straits—a place where they had no legal right to be, the laws of nations guaranteeing to every country the right to all its territory “to the distance of a marine league along all its coasts” (see Wheaton, *passim*). The strait of Shimonoseki at the narrowest portion is but half a mile wide. The mikado commanded the Choshu clan to close the strait. Foreign vessels were first warned off and then fired on. By the instigation of sir Rutherford Alcock, another expedition consisting of five British, four Dutch, and three French ships, with the small chartered steamer *Takiang*, having on board a gun and a party from the *Jamestown*, representing the United States, arrived Sept. 4 off the batteries, and began the bombardment on the 5th, continuing it for 3 days, when the silenced forts were entered and dismantled. The allied powers demanded from Japan an indemnity of \$3,000,000, of which \$750,000 was paid to the United States. The United States later returned its share to the Japanese government. On April 17, 1895, China and Japan concluded a treaty of peace at Shimonoseki, by the terms of which China acknowledged the independence of Corea, and gave to Japan the southern part of the province of Shingking, as well as the island of

Formosa and the Pescadores islands, opened a number of ports, and agreed to pay a war indemnity of about \$175,000,000.

SHIN, LOCH, in the s. of Sutherlandshire, measures 17 m. by 1 mile. The Shin water, a famous trout-stream, carries the waters of the loch into Oikell water. Loch Shin abounds in trout and salmon.

SHINDLER, MARY S. B. (PALMER), b. S. C., 1810; educated in northern seminaries; became a Unitarian and afterwards an Episcopalian. She published several volumes of poems and novels, among which were, *The Southern Harp*; *The Northern Harp*; *Charles Morton*, or *The Young Patriot*.

SHINER, the name of a small fish, the *stilbvis Americanus*; applied also to other species of the *cyprinidæ* family. The shiner is usually but 3 or 4 in. long, resembles the bream, is found abundantly in the United States, but is not edible.

SHING-KING, or LEAOTONG. See MANTCHURIA.

SHINGLES (probably derived from Lat. *cingulum*, a belt) is the popular name for the variety of *herpes* (q.v.) which is known as *H. zoster*.

SHINGLES, flat pieces of wood used in roofing like slates or tiles. Such roofs are much used in newly-settled countries where timber is plentiful. The wood is chosen from among the kinds which split readily and straightly, and is usually some kind of fir. It is cut into blocks, the longitudinal faces of which are of the size intended for the shingles, which are then regularly split off in thicknesses of about an quarter of an inch.

SHINNECOCK, a settlement of a remnant of the Shinnecock Indians abt. 100 in number, in Suffolk co., Long Island, N. Y., upon Shinnecock bay. The bay is a beautiful sheet of water about 10 m. long and from three to four wide, and is celebrated for its shell-fish. It is separated from the ocean by a narrow sand beach.

SHINPLASTER. During the American civil war it was found necessary for the Government to issue paper currency, owing to the scarcity of specie, which disappeared by being secreted or hoarded, and also in paying for imports. Small bills to the value of three, five, ten, twenty-five, and fifty cents were substituted for the coin of these denominations, and answered the purpose admirably, as they were widely circulated for several years. Comparatively few are still extant, and these are treasured as curiosities. See GREENBACKS.

SHINTOISM, or SINTUISM. See JAPAN.

SHIP (Ger. *Schiff* = *skiff*; from the root *skap-* or *skaph-*, to scoop, dig; Gr. *skaphe*, a trough, a boat) is a term applied with great vagueness to all large vessels; while under *shipping* would be included vessels of all sizes, excepting boats without decks. Among seamen, the expression is said to be limited to vessels carrying three masts, with a royal-mast surmounting each; but the development of steam-navigation, in which the largest vessels have sometimes only a schooner rig, must have gone far toward obliterating this distinction.

SHIP-BROKER—INSURANCE-BROKER. A ship-broker is a person employed in the buying and selling and freighting of ships. His duties include adjusting the terms of charter parties and bills of lading, settling with the master for his salary, collecting freights on goods brought into port, arranging with passengers for the terms of their passage, and generally managing all business transactions occurring between ship-owners and the shippers or consignees of goods. The charges made by ship-brokers are generally about two per cent on their gross receipts. Ship-brokers have been ruled not to be within the acts for the regulation and admission of brokers.

It is not customary in the U. S. for ship-brokers to unite with their business that of marine insurance brokerage. Particularly in the larger sea-ports these occupations become divided into narrower specialties. It is usual for a ship-broker to attend particularly to the buying, selling, and chartering of vessels, etc. The old practice of marine underwriting has given place almost entirely to insurance by stock companies, organized for and limiting themselves to the assumption of marine risks. Frequently, however, marine insurance companies divide their risks with similar companies by reinsurance and otherwise.

SHIP-BUILDING. See NAVIGATION; NAVIES, ANCIENT AND MODERN; NAVIES, MODERN. From crossing a river or lake on a floating log, or on two or more logs fastened together raft-wise, the first steps towards ship-building were probably canoes and currachs (q.v.). The earliest Egyptian drawings show boats constructed of sawn planks, and having sails as well as numerous oars. So far as can be learned from ancient sculptures, the galleys of the Mediterranean at the dawn of civilization appear to have been open, at least in the middle portion; to have been built with keel, ribs and planking, and to have been strengthened cross-wise by the numerous benches on which the rowers sat. Ships continued, however, to be generally of small draught, for they were beached every winter; and Cæsar mentions as a noteworthy circumstance, that some of the long ships with which he invaded Britain could only approach the shore to such a point that the soldiers in disembarking were breast-high in water. The Romans

built their vessels of pine, cedar, and other light woods; but their ships of war were of oak at the bows, clamped strongly with iron or brass, for use as rams—a custom now curiously revived after 2,000 years of disuse. According to Cæsar, the Veneti first built entirely of oak. The speedy oxidation of iron bolts and fastenings led to their supersession by copper and brass about the time of Nero. Before this time, the planks had been calked with flax, and the seams had been pitched. There is evidence to show that in Trajan's reign sheathing of lead fastened on with copper nails had been used as a protection for the timbers from the devastating insects of the Mediterranean. With the decline of Roman greatness came a new era for ship-building. The hardy Norsemen had chopping seas and Atlantic swells to fight with; their ships differed much from the stately galleys and quinqueremes of the empire. Far smaller, they were built more stoutly, with bluff bows, and a lug-sail which could be braced well up to the wind. The Norse ships must have been of considerable power, for there is good evidence that they had visited the coasts of the new world at an early period. We have, however, very little knowledge of the construction of these vessels, except that they had high prows and sterns to resist the waves, and that they were calculated for sailing in opposition to the galleys, which were for rowing. The introduction of galleys by Alfred, pulled by 40 and 60 oars, and twice as long, deep, nimble, and steady as the Danish ships, keep the latter in check; but it also checked the development of ocean-navigation, for the galleys were only fit for shore-service. The ships gradually increased in size. Hardicanute had a galley pulled by 80 oars; and contemporaneously, the Venetians are said to have built ships of 1200 to 2,000 tons. William invaded England in miserably small sailing vessels; but large—indeed very large—vessels appeared to have existed in the time of Richard I. John systematized ship-building by establishing a royal dock-yard at Portsmouth. Large ships constructed for sailing only seem to have come into general use, together with the mariner's compass, in the beginning of the 14th century. One hundred and fifty years later, the addition of the bowsprit added much to the sailing-powers of vessels.

In Ellis's collection of letters there is one, dated 1419 from John Alcêtre to king Henry V., concerning a ship building at Bayonne for that monarch. This letter is curious, as showing how many of the present terms then existed, and also that the "Kynges schyppes" were of considerable dimensions (e.g., "the stemme is in hithe 96 fete; and the post 48 fete; and kele ys yn leynthe 112 fete"). Before this period, ships had been built strong enough to encounter ice in the whale-fishery. From this period the history of ship-building is resolved into the history of individual parts, for the main principles of wooden ships were already established. In Henry VII.'s reign, the cumbersome fourth mast began to be dispensed with; in that of his successors, shifting top-masts came into fashion, the lofty stems and sterns (which must have precluded sailing on a wind) fell gradually into disuse. Port-holes were invented at least as early as 1500. In 1567, there were cutter-rigged vessels in the British seas. In the century ensuing, naval architecture was much improved by Mr. Phineas Pett, his son Peter, and by sir Anthony Deane; but the best naval architects were not in England. Within the present century, the introduction of steam has led to the building of ships with finer lines, both for bow and stern. About 1836, iron was introduced as a material for ship-building, and has now so far superseded wood, that, taking steamers and sailing ships together, 10 iron vessels are built for 1 wooden one.

Adverting now to the actual art and practice of ship-building, the subject is divisible into two distinct portions—the theoretical, known as *naval architecture*; and the practical, called *ship-building*. The naval architect designs the form of a ship with reference to the objects intended in her construction, to the speed required, powers of stowage, etc.; while the ship-builder works from his drawings, and gives practical effect to the theoretical designs.

Naval architecture on a theoretic basis is of recent date, for, as in all cases, practical efforts, more or less in the dark, have preceded by many ages the theorems of the man of science; nor is it at present by any means an exact science: some most successful ships have been but happy experiments. Our present knowledge of naval architecture we owe mostly to the researches of such men as the late Prof. Rankine, Mr. Scott Russell, Mr. Froude, and others. All ships have to possess certain qualities, the principal of which are buoyancy, stability, handiness, and speed; but it is not possible for any ship to possess at the same time the maximum of all these, as to some extent they neutralize each other. The skill of the naval architect is shown in duly proportioning them to one another, ascertaining which are the more important in each particular case, and providing these without unduly impairing the others. In some vessels, it is essential that the greatest possible speed should be attained; while, as they are to work only in smooth water, their degree of stability (or freedom from excessive rolling, and tendency to right themselves when heeled over by a wave) is only secondary. In others, which have to weather long-continued storms in mid-ocean, speed may have to be sacrificed to attain greater steadiness. In sailing-vessels, where the means of propulsion is not under control of the crew as in steamers, handiness—the property of answering quickly to their helms, and of readily performing various maneuvers (such as tacking) under all conditions of weather—is often the quality to which most attention has to be paid. Along with all these things, the ship has to be made so as to have the largest possible amount of cargo

or passenger space consistent with the proper degree of buoyancy. The degree in which a ship possesses the various qualities named depends chiefly upon her external form and dimensions, about which the following general statements may be given:

An increase of length gives an increase of displacement of water, and therefore of carrying power; if this be not desired, it allows of finer lines forward and aft, and consequently greater speed. It also increases the resistance to lee-way. The greater friction of the water on the longer sides does not appear to be material. Against the increase is to be set a diminished power of turning, tacking, and wearing. It also involves a more careful balancing of weights in the fore and after portions of the ship, for the moment of inertia of a small weight may become large in a long vessel, from being such weight multiplied into the square of its distance from the ship's center of gravity.

The increase of breadth gives greater stability to the ship, and by allowing of more sail, indirectly greater speed; but directly, it increases the resistance to the water. Of course, greater breadth enables greater bulk to be carried. Depth is a question dependent on the seas to be navigated, the object for which the ship is intended, and many other reasons. It is to be borne always in mind that the consumption of stores on a long voyage will change the draught of a ship considerably. Practice has proved unequivocally that ships sail better for drawing more water aft than forward.

Passing now to the actual designing of vessels: the architect works on paper only; he has therefore to show on a flat surface, for the builder's guidance, the exact position, curvature, and relief of every line and point in his proposed structure. He accordingly draws three plans, on each of which every point of the ship is traceable; the *sheer-plan*, showing all lines of length and height; the *half-breadth plan*, lines of length and breadth; and the *body-plan*, which shows breadth and height. From these combinations, the exact position of every point is determinable. Figs. 1 to 3 show those plans, called *construction drawings*, on the same scale for the *Great Eastern* steamship. The *sheer-*

plan represents, in its outside line, a vertical plane through the keel. The dotted lines 1, 2, 3, are the edges of supposed horizontal planes drawn at various heights. The curved lines, I, II, III, are the edges, as they would appear on the outer covering of the ship, of vertical planes drawn parallel to the central plane through the keel. The uprights, A, B, etc., A₁, B₁, etc., are the edges of supposed planes drawn at given distances from the line of greatest breadth X, at right angles to the plane through the keel. The half-breadth plan represents one-half of the ship's upper deck, as regards the black outer line; the horizontal, vertical, and cross sections of the sheer-plan appearing again under different conditions. The vertical longitudinal sections become straight lines parallel to the keel; the horizontal sections appear as curves taken at different heights on the vessel's sides. The body-plan is the ship looked at end-on; the outer line being her cross section at the line of greatest breadth, and the horizontal and vertical sectional lines appearing at right angles to each other. The lines on the left side correspond to the cross sections of the after-body (that is, the portion of the ship nearer the stern than the line of greatest width), and the lines on the right side show the curvature up to the bow. Of course, in working-drawings from which ships are to be actually built, the scale employed would be very large; and instead of three or four sectional lines in each direction, a great number would be inserted for the guidance of the builder. With these three plans in hand, the workman has the exact position of every point in the ship's exterior coating exactly defined. Even the unprofessional observer need not strain his imagination greatly to clothe these flat plans with their dimensions of length, breadth, and depth, and to conjure up before his eyes the precise form of the goodly ship represented.

URBANA

ceases, but in most cases the two professions of naval architect and ship-builder are combined in one firm, if not in one man. It is then to be decided of what material the ship shall be constructed. The choice lies between iron, steel, wood, and a combination of wood and iron. Of the many woods employed, oak, teak, and fir are those most commonly used. The building of a wooden and of an iron ship are quite distinct operations, the requisite strength being obtained in a different manner in each case. It is necessary, therefore, to consider separately the principles of wooden ship-building and iron ship building; and as the older and most time-honored process, we will first deal with the art of the ship-wright who forms the vessel of timber.

In addition to the construction drawings which we have described, it is usual also to construct a small wooden model of the ship—upon a scale very often of $\frac{1}{4}$ inch to the foot—which shows the designer what his ship is going to look like better than the flat paper can do. This model is made of a number of horizontal layers of wood, and upon it the whole arrangement of the plating of the ship is marked, with the position of all the joints, etc.

Wooden Ship-building.—The first process is to develop or “lay off,” on the *mold-loft floor*, certain full-size working sections of the required ship. These are taken from the construction drawings and the model, and are built up of planks. The combinations of these pieces of plank show the shape in which the several timbers will have to be cut, to impart the necessary curvature and strength.

The next step in actual construction is to prepare the slipway by raising a number of strong blocks of timber a short distance apart, on which the keel shall rest, and which shall sustain the entire ship when built. These blocks are composed of several pieces, and it is of the utmost importance that their upper surface be in an exact line. That line is made at an inclination of $\frac{1}{8}$ of an inch to a foot; and the keel of the ship, and the ship itself, have consequently that slope to the horizon while building. This inclination is for the facility it affords in launching the completed vessel. On the blocks is laid the keel, which may be called the backbone, and is certainly by far the most important timber in the ship. From it start the ribs, the stem, and the stern-post; so that any serious accident happening to the keel involves the breaking up of the whole structure. It is, therefore, made of great strength, being, in a first-rate, no less than 20 in. square. The material is usually elm, on account of its toughness, its non-liability to split, and the fact that immersion in sea-water preserves it. The pieces of which it is composed are united by the strongest kind of scarf joint (see CARPENTRY).

What the keel is to the bottom, the stem and the stern-post are to the bow and stern of the ship, forming the keys against which the “butts” and all longitudinal supports start. Each is, of necessity, of great strength, and they rise from the respective extremities of the keel. The *stern-post* has to bear the rudder, and is usually made, when possible, of one piece of timber; it is united to the keel by a mortise and tenon joint. In screw-steamers there is a second stern-post, forming the forward support for the screw.

The extreme outlines of the ship being now established, the builder proceeds with the timbers to form the bottom and sides, which together constitute the *frame*, corresponding to the ribs in an animal. The ribs form the sides of the ship, and are placed at from 2 ft. 6 in. to 3 ft. 9 in. from center to center. Up to the water-line the spaces between them are filled in solid with timbers of equal thickness. For this purpose in the midship-body the keel is crossed at right angles, or nearly so, by certain timbers which form the *floor*. The keel is let about three-fourths of an inch into a groove running along the bottom of the floor, while above the floor the *keelson* is a massive timber, parallel to the keel. The keel and keelson are bolted firmly together by long copper bolts,

FIG. 4.—Ribs and Decks in section:

A, keel; B, keelson; C, false keel; D, floor; EE, fut-tocks; F, top-timber; G, lengthening piece; HH, wales; I, diminishing planks; K, bottom planks; L, garboard strakes; M, beam; N, deck; O, shelf; P, waterway; Q, spirketing; R, clamps; S, knees; T, side-keelsons; V, limber strakes; W, rough-tree rail; X, mast.

which pass through the timbers of the floor, and completely fix the latter. As an additional strengthening to the frame in large vessels, *side or sister keelsons* are bolted on to the floor or futtocks, a short distance on each side of the principal keelson. Fig. 4 is a cross section of a three-decked wooden vessel, showing a complete rib, with the principal parts as they are commonly arranged amidships. Near the ends of the ship the frames no longer stand at right angles to the keel, but are necessarily bent or canted round.

After the main skeleton, as it were, of the ship is built, the skin is the only thing remaining to complete its exterior. This is represented by thick wooden planking, fastened on to the ribs, the lowest layer pressing into the rabbet of the keel, and the highest reaching to the uppermost bulwark. The thickest planking is at the bends or wales, marked H in fig. 4, where it varies from 4½ in. in small vessels to 10 in. in ships of the first class. Every complete line of planking from stem to stern is styled a *strake*. Oak and fir are the woods mostly used for the skin, and elm for the planks nearest the keel. The planks are generally fastened to the ribs by copper bolts, but wooden treenails are frequently employed, as less in weight than copper, and less liable to split the wood. The comparative utility of wood and copper fastenings for the strakes is still a disputed point.

In a well-constructed ship the filling in of the timbers to a level above the water-line should be so accurately formed that she would float without her planking; but when the latter has been well calked, it is certain that it adds greatly to the dryness of the ship, while it aids materially in binding her several parts together.

At frequent intervals across the ship, and at the heights of the several decks, are inserted the *beams*, which are solid masses of timber, either in one piece or scarfed. These prevent the ship from collapsing, and at the same time support the decks. The beams and decks are shown at M and N respectively in Fig. 4. The beams are always made convex upward, principally for the sake of preventing water lodging on the decks. When the beams are well established, the hatchways and mast-holes are traced out. This done, the deck is laid down of straight-grained hard wood, and the planks are calked and pitched between, until the deck or platform becomes perfectly water-tight.

Along the inside of the bottom are laid the *sister keelsons* or *side keelsons*, if the ship be large, and all spaces are filled up with planking, except the width of one plank next the keelson on each side, which is left for a drain to carry all refuse-water to the foot of the pumps.

Iron Ship-building.—Iron affords, in many respects, a better material for ships than wood. In the first place, the same strength may be obtained with less weight; secondly, iron plates can be bent to any curve, so that the combinations necessary for strength in wooden vessels can be avoided. The laying off the lines of the vessel full size upon the mold-loft floor is the first process in iron as in wooden ship-building. Rough wooden templates are here made of the cross sections of the ship, one template to every cross section.

The slip-way is prepared in much the same way as in the case of a wooden ship. The keel is generally of flat bar-iron—sometimes in several thicknesses—the different lengths being scarfed at the ends and riveted together, or sometimes welded. In the cross section of a 2,000-ton iron vessel given in Fig. 5, the keel is in five thicknesses; in the middle a center-plate, which is carried upward through the floors, and forms a keelson; on either side of this a thick bar, and outside these again the two lowermost plates of the skin bent downward. The whole five thicknesses are riveted together.

The ribs in an iron ship are called “frames.” They are always made of angle-iron, and are placed from 18 in. to 2 ft. apart. They are bent, while red-hot, upon a large flat cast-iron plate, into the proper curve, fixed by the templates already mentioned. The frames, when thus bent to the right shape, are set up in place upon the keel. To them are fastened at the bottom the *floors*, which are narrow plates running across the ship; and frequently additional stiffness is gained by running “reverse” angle-irons along the top of the floors, throughout at least a considerable portion of the ship’s length. The beams which support the deck are convex upwards as in wooden ships. After the frames, floors, and beams are in place, the plating commences, each particular plate being of a size and shape exactly as determined by the model. The lowest plates of all are called the “garboard strake,”

FIG. 5.—Section of Iron Ship:

a, frames; b, reverse angle-irons; c, floors; d, keelson plate; e, e, decks; f, f, deck beams; g, bulwarks; h, h, stanchions; i, i, bilge keelsons; k, ceiling.

and are usually bent downward and riveted to the sides of the keel, as in fig. 5. The thickness of the plates gradually diminishes upward, till the "sheer strake"—the strake at the level of the main deck—is reached, and this is always made very strong. The deck beams are further secured and stiffened by longitudinal and diagonal plates called "stringers." All the iron-work of a ship is fastened together by rivets. Holes are first punched or drilled in the plates and angle-irons—in most cases before they are put together. The holes having been made exactly to overlap, a red-hot rivet is inserted through them. A man, called a "holder-up," holds the head of the rivet forcibly in its place with an iron tool, while two riveters on the other side of the plate strike its end rapidly with their hammers until it is all hammered down. The contraction of the rivet when it cools causes it to hold the two plates still more tightly together. Iron ships are always divided into a number of compartments by transverse partitions called "bulkheads." These partitions can easily be made water-tight, and then afford great additional security to the vessel, as, in the event of a leak occurring, it will often be possible to confine the water to the space between two bulkheads, and there will be sufficient buoyancy in the other compartments to keep the vessel afloat. The bulkheads are fitted with water-tight doors, and besides being a source of safety, they are also the cause of great additional transverse strength.

By the time that the external plating of the ship is finished, and the beams and bulkheads all in their places, she is ready for launching; much, however, still remains to be done to her. Most frequently, the greater part of the decks has to be laid, and the whole of the cabin fittings to be put up; the rudder and steering gear have to be fitted; the wooden "ceiling" (which lines the hold) to be put in; the masts have to be set, and all the spars, sails, and rigging put up; and lastly, in a steam-vessel, the engines and boilers have to be placed and properly secured on the seatings provided for them.

Steel has till lately been little used in the construction of ships. As it possesses much greater strength than iron, all the various parts of a steel ship may be made much lighter for the same strains than in an iron one. There has been, however, a very widespread distrust of this material among ship-builders, based, to some extent justly, on the difficulty of getting really reliable steel plates and bars. But since 1880 the use of steel has been favored. In the United States there are great ship-building yards at Chester (Pa.), Philadelphia, Baltimore, San Francisco, and even on the lakes, as at Buffalo, that turn out iron and steel ships. In 1890, this country built ships having a total tonnage of 148,000 tons.

Ships of Iron and Wood conjointly, or "composite" vessels.—It was at one time thought that various advantages would be obtained by the use both of iron and of wood in the same ship, the frame and beams being made of the former material, and the skin of the latter. Composite vessels were always more used by the French than among ourselves, but although Lloyd's committee have thought this class of vessels of sufficient importance to publish special rules in reference to it, very few composite ships are now constructed.

In some modern ships of war, chiefly in the English navy, the vessels, after being built of iron in the usual way, and heavily armored, have been covered all over with planking, and copper-sheathed. The object of this has been to insure that the ship's bottom shall not be fouled with weeds and barnacles, which so easily happens with iron vessels, as these frigates are intended for very high speeds. See STEAM NAVIGATION.

Ships of Aluminium.—In December, 1893, the first vessel ever built of aluminium (a pleasure yacht) was launched at St. Denis, near Paris. Many ship-builders expect this light and now cheapening metal to enter largely into the naval construction of the future.

Internal Arrangements of a Ship.—Whether the vessel be of iron or wood, her internal design must follow the purposes for which she may be required. As a general principle, the ship is divided into a greater or less number of platforms, floors, or decks (q. v.), devoted to various purposes. In a ship-of-war a large portion is required for the men, the remainder being occupied by warlike stores, provisions, and coal. In a merchant-vessel far less space is allotted to the crew, and far more to the cargo. In every ship a space must be provided for the carriage of provisions and water proportionate to the number of the crew and the intended duration of voyages. A steamer differs from a sailing vessel in requiring a large compartment amidships to be kept clear for her engines and boilers. In screw-steamers, to the height of the boss of the screw above the keelson, a tunnel, known as the *screw-alley*, has to be kept open for the shaft of the screw from the engine-room to the stern. The heavier portion of a cargo, as coal and water, is carried immediately above the keel, so that the center of gravity may be as low as possible, and for the same reason the engines and boilers are placed as low down as practicable. For various details concerning the formation and arrangement of ships, the reader is referred to detached articles descriptive of the respective portions, as CABLE; CAPSTAN; DECK; HOLD; KEEL; MAST; MASTS; SAIL; SHEATHING, ETC.

Lloyd's.—In order that a ship may be insured by the underwriters, it has to be inspected and surveyed by one of the surveyors of "Lloyd's." According to the reports of their surveyors, the committee of Lloyd's registry classify the vessel, affixing to its name a letter which is intended to be as nearly as possible a correct indication of its real and intrinsic qualities. For wooden vessels, these letters (in order of excellence) are A (in black or red), Æ, E, and I; for iron ships or steamers they are A, A, and A.
A A A
A B C
 Numbers put before these letters indicate the number of years for which they are to

hold the grade indicated by the letter; and numbers (1 or 2) put after the letters refer to the completeness of their general equipment.

SHIP CANAL, INTEROCEANIC. See INTEROCEANIC SHIP CANAL.

SHIPKA PASS, in Bulgaria, near the center of the Balkan mts.; 47 m. n.e. of Philipopolis, and 3 m. n. of the village of Shipka. Elevation, 4270 ft. It was made famous during the Russo-Turkish war, 1877. The pass fortified by the Russians was attacked by the Turks under Suleiman Pasha. For one week it was the scene of fearful conflicts, no less than ten attacks being made, in all of which the Turks were repulsed with great loss. 8000 Turks and 4000 Russians were reported to have fallen about the pass.

SHIP-MONEY, a tax had recourse to in England at various times, but especially in the reign of Charles I., for the equipment of a fleet. In 1607, when the country was threatened by the Danes, a law was made obliging all proprietors of 310 hides of land to equip a vessel for the protection of the coast. Elizabeth, at the time of the threatened Spanish invasion, required the various ports to fit out a certain number of ships at their own charge; and so great anxiety was shown by the public for the national defense, that London and some other ports furnished twice as many vessels as had been demanded. It was in 1626 that Charles first had recourse to an impost of this description, requiring each of the maritime towns, with the assistance of the neighboring counties, to arm a given number of vessels, 20 being required from London. In 1634 the tax was extended over the whole kingdom. A general spirit of resistance was immediately aroused, not so much in consideration of the amount of the tax, as of the objectionable feature, that it was imposed by the arbitrary authority of the king alone, which had come to be regarded as an unwarrantable stretch of the royal prerogative. In 1637 the celebrated John Hampden, a gentleman of property in Buckinghamshire, resolved to confront the power of the government by disputing the legality of this exercise of the prerogative, and resolutely refused payment of the impost, an example in which he was followed by nearly the whole county to which he belonged. He was prosecuted in the exchequer chamber for non-payment, and his trial was watched with great interest and anxiety by the nation on account of the constitutional point involved in it. The judges, four excepted, pronounced in favor of the crown; but the trial had the effect of thoroughly arousing the public mind to the danger of the imposition of taxes by the royal authority alone. The long parliament, shortly after its meeting in 1640, voted ship-money illegal, and the sheriffs and others who had been employed in assessing it or collecting it to be delinquents; and canceled the sentence against Hampden.

SHIPPEN, WILLIAM, 1736-1808; b. Philadelphia; graduated at Princeton college in 1754; studied medicine with his father, afterward at London and Edinburgh; returned to Philadelphia and lectured on anatomy in 1762; became professor of anatomy and surgery in the Philadelphia medical school in 1765; was in the medical department of the army in 1776, and its director-general in 1777-81.

SHIPPING, LAW or, treats of the ownership and employment of ships, the rights and obligations of their owners, masters, and seamen, and of the owners of their cargoes, and all contracts and torts arising from the employment of ships. By the U. S. statutes, the owners, masters, and officers of a vessel must be U. S. citizens to make it a U. S. vessel; it must be built in the United States, and must be duly registered or enrolled. Whenever it is sold, the bill of sale must recite the original certificate of enrollment or registry, or it cannot obtain a new registry. If the vessel is for foreign commerce, the necessary facts are presented on affidavit to the collector of the district, who issues a certificate of registry, which is evidence anywhere of the nationality and character of the vessel, whose name and that of its owners as well as its tonnage, where it belongs, etc., must be recited. If the vessel be less than 20 tons burden, only a license is necessary. If the vessel be over 20 tons burden and designed for fishing or the coasting trade, a certificate of enrollment issues in the same way in addition to a license. The rules of property in ships, unless modified by statute, are the same as those of other chattels. By statute, title to a U. S. vessel can be had only by building, by a judicial sale as a prize or for forfeiture, or by purchase and repair in this country at a cost of at least three-fourths its value, of a wrecked foreign vessel. By statute, also, every conveyance, mortgage, or bill of sale of any vessel or part of a vessel of the United States must be recorded in the office of the collector of the district where the vessel is registered or enrolled; otherwise such conveyance, etc., is valid only against the grantor, etc., his heirs and devisees, and persons having notice in fact. As to persons employed in navigating the ship, only the powers of the master need be considered here; the rights of the seamen, whose claim for wages takes precedence of all other liens upon the vessel, and is enforced in admiralty by a proceeding *in rem*, are protected by comprehensive statutory provisions. But the liability for wages is conditional upon earning freight on the voyage. The master has an absolute authority over the officers and crew, and in the navigation of the ship. He may bind the owners on all ordinary shipping contracts, which are usually executed in his name, and upon which suit may be brought by or against him personally. He may borrow money for repairs, hypothecate ship or cargo, and, in certain cases, even sell or abandon both. It is now held, however, that, before

resorting to any extraordinary step, he must, if within reach of the telegraph, get instruction from his principals. The rights and liabilities of owners of vessels are, unless limited by statute, identical with those of common carriers. See CARRIERS.

The regulation of shipping in the U. S. is solely under the jurisdiction of congress, and is purely a matter of statute law. By an act passed 1884, June 26, various changes were made in the law. It is provided that while, as before, all officers of vessels of the U. S. must be citizens of the U. S., an exception may be made when, on certain foreign voyages, there is a vacancy below the grade of master. Such a vacancy may be filled by an alien until the return to the home port. Where seamen are discharged on account of the unseaworthiness of the vessel when this results from negligence, they are entitled to a month's extra wages; and if the discharge take place in a foreign port, the master must pay the extra money to the U. S. consular officer at that port on behalf of the seaman. The provision to prohibit the payment of advance wages is made stronger in its terms, and a penalty is imposed upon any person paying such wages. There is a proviso, however, which permits such payments to a wife, mother, or other relative of the seaman. The act further limits the individual liability of the ship owner to the amount of his interest in the vessel; and the liability of all the owners is limited to the value of the vessel and freight. For the two principal shipping contracts, see BILL OF LADING and CHARTER PARTY. For the rules of navigation, see NAVIGATION, LAW AS TO. And for so much of the subject as is not treated here, see MERCHANT SHIPPING ACT, PART OWNERS, SHIP'S HUSBAND, DEMURRAGE, STOPPAGE IN TRANSITU, FREIGHT, AVERAGE, BOTTOMRY, RESPONDENTIA, SALVAGE, SEAMEN.

SHIP-RAILWAY. See INTEROCEANIC SHIP-RAILWAY.

SHIP'S HUSBAND, the maritime term for an agent appointed by the owners to attend to all matters connected with the outfit, repairs, and freighting of the ship. Under this capacity his powers have been held to be very large. He must see to it that the ship is seaworthy in all respects, has a proper crew and officers, is fully furnished with provisions, and has proper clearances and registry. He has power to enter into charter-parties (q.v.), and may settle freight-contracts, but has no power to insure the vessel nor to borrow money for her use; nor has he as ship's husband any lien on ship or proceeds. He is usually one of the part owners (q.v.), and his powers may be enlarged by acts of the owners.

SHIPTON, MOTHER, the dates of whose birth and death are currently, but on slight authority, given as 1488-1559, a so-called prophetess who lived at Winslow-cum-Shipton and Clifton, in Yorkshire, Eng., and attained her greatest cotemporary fame during the reign of Henry VIII. Conflicting accounts represent that her first name was Agatha, that it was Ursula, that she had no first name, and that her last name was derived from her husband Toby Shipton, from her father Solomon Shipton, and from her mother Ursula Shipton, a maiden lady who had an intrigue with the devil. But at all events, during her lifetime she seems to have been well known in her own locality and to have been constantly consulted by her neighbors; and after her death her reputation extended over the kingdom, being assisted in its growth by the frequent appearance of chapbooks or pamphlets purporting to be collections of her prophecies. Some of these may have been genuine but the larger number were from time to time invented and attributed to her. The latest edition of Mother Shipton's prophecies was published, 1862, by Charles Hindley who included in it some doggerel verses written by himself which, after describing a number of wonders that had happened, wound up with the declaration that the world would come to an end in 1881. In spite of his subsequent confession of the hoax the advent of that year was looked upon with much alarm by the superstitious in England and America. See Harrison, *Mother Shipton Investigated* (1881).

SHIP-WORM. See TEREDO.

SHIPWRECKS, in ancient times, were deemed the property of the crown, but by a statute of Henry I., the harsh consequences of this law were avoided whenever any person escaped alive out of the ship; and in Henry II.'s charter it was declared that if either man or beast escaped alive, the goods should remain to the owners if claimed within three months; and the courts of law still further refined away all these harsh rules. Many nice distinctions have been made as to what goods constitute wreck, which is distinct from goods floating. See FLOTSAM. By the well-known English shipping act, 1854, which extends to the United Kingdom, the board of trade has the superintendence of all matters relating to wreck, and to jetsam, flotsam, and ligan. Receivers of wreck are appointed for various districts, and have power to summon assistance. When wreck is found by any person, he must give notice to the receiver of wrecks, and if nobody claim the property within a year, it is sold, and the proceeds, after paying salvage and other such expenses, are paid into the exchequer.

SHIRAS, ALEXANDER EAKIN, 1812-75; b. Philadelphia; graduated at West Point, 1833; commissioned in the artillery; 1839-43, was professor at West Point. In the Mexican war he served in the commissary department, and was assistant to the commissary general, 1847-63. In 1874 he was made commissary general with rank of brig.gen. In 1865 he received the brevet ranks of brig. and maj.gen.

SHIRAZ, a celebrated city of Persia, and the capital of the province of Farsistan, in lat. $29^{\circ} 36' \text{ n.}$, long. $52^{\circ} 35' \text{ e.}$, was formerly a very flourishing city, and the ordinary residence of the Persian monarchs, but is now singularly divested of its ancient splendor. It is situated in a wide plain, on one of the limestone ledges which shoot out from the great west-Persian mountain system, 112 m. from the Persian gulf, and 35 s.w. of the ancient Persepolis (q.v.). It is inclosed by walls nearly 4 m. in circumference, and, previous to the great earthquakes which have repeatedly laid it in ruins, contained many splendid mosques, bazars, caravansaries, and other public buildings. The houses, which are mostly built of stone, are superior in appearance to those of most other Persian towns; and the adjoining portion of the plain is of exuberant fertility, and is laid out in vineyards and in rose-gardens of great extent. The principal manufactures are silk, cotton, and woolen goods, rose-water, glass, and inlaid goods. The wine of Shiraz, which is very strong and resembles Tokay, is still famous throughout the east. Rose-water is also still prepared in large quantities. The trade of the town is transacted in the *bazar-i Wukell*, which is about a quarter of a mile long by 40 ft. wide, and affords accommodation to several hundred shop-keepers. Shiraz carries on trade with Yezd, Ispahan, and Bushire, from the last of which towns it receives Indian and European goods. The city was founded in 697 A.D., and from its beautiful situation and charming climate became a favorite resort of the Persian princes; but a destructive earthquake in 1812 laid a large portion of it in ruins, and another in 1824, which cost the lives of 4,000 of the inhabitants, completed the wreck of its prosperity. It was, however, rebuilt, and had attained a pop. of 40,000 (its pop. previous to 1812 having been almost 60,000), when a third and more terrible visitation of this destructive agent, in April, 1853, laid almost the whole town again in ruins, and caused the death of 12,000 people. It has since been partially rebuilt in a somewhat inferior style, and its pop. is now estimated at 30,000. It is celebrated for the number and eminence of the scholars and poets to whom it has given birth; chief of these is Sibuyah, the first of Arab grammarians; Hafiz (q.v.), the "Anacreon" of Persia, whose tomb is half a mile n.e. of the Ispahan gate; and Sadi (q.v.), whose mausoleum is 22 m. to the n.e.—See *History of Persia*, by Clements Markham, 1874.

SHIRE, a river of south-eastern Africa, has its source in lake Nyassa, from which it issues in lat. $14^{\circ} 28' \text{ s.}$, and after a southerly course of 250 m., joins the Zambesi. It flows through a cotton and sugar producing country of vast extent, is 80 to 150 yds. broad, 12 ft. deep, and never varies more than 2 or 3 ft. from the wet to the dry season. Its current travels at the rate of 24 knots an hour. The navigation is obstructed by cataracts over a space of 35 m., in which it falls 1200 feet.

SHIRE (Sax. *sciran*, to divide), a term which seems to have originated in the 8th c., and is applied to the districts, otherwise called counties, into which Great Britain is divided. A considerable number of the counties of England, as Kent, Essex, Surrey, Norfolk, Suffolk, were formed out of the petty kingdoms of the Anglo-Saxons, which, with the advancing tide of centralization, were gradually becoming consolidated into one great kingdom. As early as 800, an entry in the Saxon chronicle relates that kings had ceased to reign among the *Hwiccas* (the inhabitants of the district afterward known as Worcestershire), and that they were governed by an ealdorman acting under Cynwulf, king of Mercia. This substitution of ealdormen (or earls) for kings marks the gradual organization of the counties. It was sometimes found convenient to split up a kingdom into several shires. The civil, military, and judicial head of the shire was the ealdorman, whose office was not necessarily hereditary, though it had sometimes a tendency to become so. Twice a year he held the shire-mote, in which he and the bishop presided with equal jurisdiction. Among other questions which would come before the shire-motes were those that related to the boundaries of the respective shires. As a border thane pushed his occupation toward the frontiers of the shire to which he belonged, and came into collision with the occupants of the neighboring shire, questions necessarily arose which could only be settled by a compromise arranged by the two shire-motes, and these compromises may account for the irregular jagged boundaries which separate shire from shire, and occasional isolation of particular portions. Yorkshire, Durham, Cheshire, and Worcestershire derived their name from their ancient bishoprics. Various shires which had once an existence in the n., as Northamptonshire, Islandshire, Hexhamshire, Hallamshire, Bamboroughshire, have merged into others. The term shire is nearly synonymous with county, yet not quite so, as there are certain counties with whose names the affix "shire" is never used. One explanation which has been given of this usage is, that the object of the addition of the syllable "shire" is to distinguish the county from the town of the same name, and that it is therefore only applicable to counties bearing the same name with their county town. Another explanation is that shire, being a word of Anglo-Saxon origin, is not properly applied to any of the English counties except those which formed part of the larger Anglo-Saxon kingdoms. Neither of these reasons is exactly correspondent with the actual usage by which shire terminates the names of all the English counties except the following: Northumberland, Cumberland, Westmoreland, Durham, Norfolk, Suffolk, Essex, Sussex, Middlesex, Kent, Surrey, and Cornwall. In Cheshire we drop the final syllable of the town of Chester. Berkshire, Shropshire, and Hampshire are never used in their simple form, though sometimes abbreviated into Berks, Salop, and Hants. Shire is applied to all the Welsh counties except Anglesea.

In Scotland, the English tendencies of the sovereigns from the time of Malcolm Can-

more to the war of succession, and the tide of immigration from the s., brought in, among other innovations, the division into shires. Its introduction seems to have begun early in the 12th century. Twenty-five shires or counties are enumerated in a public ordinance of date 1305. Nearly all the counties of Scotland may receive the terminal addition of shire. It is not applied to the island county of Orkney, and seldom to the counties of Bute and Caithness. Kirkcudbright is neither a shire nor a county, but a Stewartry. See STEWARTRY. The Irish counties are not generally called shires.

In England, s. of the Tees, there was a subdivision of the shires into *hundreds*, which originally, in theory at least, seem to have been districts inhabited by 100 or 120 families; and were in some localities called *wapentakes*, these hundreds or wapentakes being further subdivided into *tythings*, inhabited by ten free families; and it became incumbent on every one to be enrolled in a tything and hundred for the purposes of civil government. In some of the larger counties there was an intermediate division to which that into hundreds was subordinate. Yorkshire had and still has its *ridings* (q. v.), Kent had its *lathes*, and Sussex its *rapes*. The division into hundreds and tythings never penetrated into the four northern counties of England, or into Scotland, where the *ward* and *quarter* were the immediate subdivisions of the county.

England possessed three *counties palatine*—Cheshire, Lancashire, and Durham—of which the earls formerly possessed all the judicial and fiscal powers of the crown, all now annexed to the crown (see PALATINE).

SHIRLAW, WALTER, b. Paisley, Scotland, 1838; was brought to the U. S., 1840; studied for some years in Munich, Bavaria, but has spent most of his professional life in New York and Chicago. He was elected a member of the Chicago acad. of Design, 1868, and an associate of the National acad., New York, 1878, academician in 1888, and was made prof. in the Art Students' league. He was first pres. of the soc. of American artists. Among his paintings are, "Good Morning," "Sleep," "Toning of the Bell," and "Sheep-Shearing in the Bavarian Highlands."

SHIRLEY, a town in Piscataquis co., Me.; on the Boston and Albany railroad; 25 miles n.w. of Dover; settled 1825; incorporated, 1834; principal industry, lumbering, Pop. '90, 291.

SHIRLEY, a town in Middlesex co., Mass.: on the Fitchburg railroad; 40 miles n.w. of Boston. It was incorporated in 1753; contains the villages of Shirley, Wood's Village, and North Shirley; it has a high school, Hazen memorial library, saw, planing, and grist mills, and cordage, suspender, and basket works. Pop. '90, 1191.

SHIRLEY (SHERLEY), SIR ANTHONY, a distinguished traveler, navigator, and writer, was born in England in 1565. His first noted expedition was to the court of Shah Abbâs of Persia, who received him with much distinction, and sent him on an embassy to the different courts of Europe with the design of arranging an alliance with Persia against the aggressions of the Turks. He subsequently spent much time in Spain, and entered the Spanish naval service with the title of Admiral of the Levant Seas. He wrote a work entitled *A True Relation of the Voyage Undertaken by Sir Anthony Shirley, Knight, in 1596*, and a second narrative entitled *The Relation of Sir Anthony Shirley's Travels in Persia*. He died in Spain about 1630.

SHIRLEY, EVELYN PHILIP, an English antiquary, scholar, and genealogist was born in England in 1812 and died in 1882.

SHIRLEY, JAMES, 1596-1666; b. London; educated at Oxford and Cambridge, was curate at Hertfordshire, but soon resigned on account of becoming a Roman Catholic; opened a school at St. Albans, but, being unsuccessful, went to London, and became a dramatic writer. He founded a classical academy in London. His *Dramatic Works and Poems* were published in six volumes (1833), and include among other plays *The Lady of Pleasure*, *The Humorous Courtier*, *Bird in a Cage*, *Hyde Park*, *The Traitor*, and *St. Patrick for Ireland*.

SHIRLEY, ROBERT, brother of Sir Anthony Shirley, was born in 1570. He visited Persia with his brother and, like him, was employed in the service of the Shah Abbâs, both in the army and on several missions to the European states. He died in 1628.

SHIRLEY, THOMAS, eldest brother of Sir Anthony Shirley, and, like him, a traveler of distinction. He spent much time in Turkey, and published an account of his observations and adventures there. The date of his death is not known.

SHIRLEY, WILLIAM, 1693-1771; b. England; studied law and emigrated to Boston, 1734; was a commissioner to determine the boundary between Massachusetts and Rhode Island; governor of Massachusetts, 1741-45, and again in 1753, after a sojourn of eight years in England; commander-in-chief of the forces in British North America against the French, 1755; lieut. gen., 1759, afterward governor of the Bahama islands; returned to Massachusetts and built a residence at Roxbury in which he died. He wrote *Electra*, a tragedy, and a *Journal of the Siege of Louisburg*.

SHIS'DRA, or JISDRA, a t. of European Russia, in the government of Kaluga, and 82 m. s.w. from Kaluga, on the Shisdra, a branch of the Oka. It has a number of manufactures. Pop. '93, 13,248.

SHISHAK (in hieroglyphs, Shashank, the Susak or Susakim of the Septuagint, and the Shishak of the Hebrew version, the Sesonchosis or Sesonchis of Manetho), the name of several monarchs of the 23d, or Bubastite Egyptian dynasty, supposed to have descended from foreign settlers in Bubastis, and to have been of Shemitic origin. The kings of this name were Shishak I., the first monarch of the dynasty, whose name is found in the portico built by the Bubastite dynasty at the great temple of Karnak, and on several statues of the goddess Pasht, which probably came from Luxor. Jeroboam fled to Shishak from the pursuit of Solomon, who wished to kill him, and lived there during the lifetime of Solomon. On the death of this monarch, Jeroboam quitted Egypt, and contended with Rehoboam for the possession of the crown. This struggle caused the division of the kingdom of David into two states, that of Israel and Judah. In the fifth year of Rehoboam, Shishak marched to Jerusalem with an army of 12,000 chariots, 60,000 cavalry, and an innumerable number of infantry, composed of Troglodytes, Libyans, and Ethiopians. He took the city, the treasures of the temple, and all the gold bucklers which Solomon had made. The conquest of Jerusalem is found recorded on the monuments of Karnak, on which Shishak I. is represented dragging before the god Ammon three files of prisoners, inscribed with various names of places, among which are Judea, Mageddo, Ajalon, Mahanaim, and other towns taken by Shishak in his line of march.

SHITTIM-WOOD. It is not certain what kind of wood is meant by this name in the Old Testament. The ark of the covenant was made of it, and probably it was a kind of wood distinguished both for beauty and durability. It has generally been supposed to be the wood of the *acacia nilotica*, which, however, is deficient in both these qualities. Another supposition is, that the wood of a species of olive is meant, *olea similis*, which possesses them both, and is particularly remarkable for its durability.

SHIVES, a name used by cork-cutters to designate the small bungs used to close wide-mouthed bottles, in contradistinction to the phial-corks used for narrow-necked bottles.

SHO'A, a district of Abyssinia, in lat. 8° 30' to 10° or 11° n., long. 38° to 40° 30' east. Its boundaries, however, are by no means fixed, that on the w., where Shoa is bordered by the Galla tribes, being especially variable. An extensive tract in the e. of the kingdom, between the capital, Ankobar, and the river Hawash is called Efat. The character of the country, and the condition of the people, are described under Abyssinia (q.v.). The area is about 15,000 sq. m., and the population is estimated at 1,500,000.

SHOCK, COLLAPSE, AND REACTION. It is well known that some forms of injury, as, for example, a blow on the pit of the stomach, may occasion death without leaving any visible trace of their operation in the body; and, indeed, life may occasionally be destroyed even by sudden and powerful mental emotions. In such cases as these death is said to result from shock, the actual cause of death being the sudden arrest of the heart's action, consequent on the violent disturbance given to the nervous system. Instead of actual death, the condition known as *collapse* is more frequently induced, in which the patient lies in a state of utter prostration, and apparently on the verge of dissolution. The face, and even the lips, are pale and bloodless; the skin is cold and clammy, and drops of sweat are often seen on the forehead. The features are contracted, and there is great languor in the general expression. There is extreme muscular debility, and the sphincter muscles sometimes relax, so that there is involuntary discharge of the contents of the bowels and the bladder. The pulse is quick, and so feeble as often to be almost imperceptible, and the respiratory movements are short and weak, or panting and gasping. The patient is in some cases bewildered and incoherent, in others drowsy, and sometimes almost insensible. Nausea and vomiting, with hiccup, are not unfrequent symptoms; and in the case of children, convulsions are often present.

When a person recovers from a state of collapse, he passes into a condition termed *reaction*, which often lasts for several hours. The first symptoms of this favorable change are improvements in the state of the pulse and the respiratory actions, recovery of the power of swallowing, an increased temperature, and an inclination to move from the supine position to one side. A slight degree of feverishness then often ensues, after which the skin becomes moist, the patient falls asleep, and awakes convalescent. As a general rule, the longer the symptoms of reaction are delayed, the greater is the danger, and if several hours pass without any sign of the commencement of reaction, there is little hope of recovery. If the reaction is imperfectly developed, a condition may supervene which is known as "prostration with excitement," which may terminate either fatally or favorably, and into the symptoms of which our limited space will not allow us to enter further than to remark that a peculiar delirium, closely resembling *delirium tremens*, is most commonly present.

The principal causes of collapse (as given by Mr. Savory in his article "Collapse, and the General Effects of Shock upon the System," in Holmes's *System of Surgery*) are:

"Injuries sudden and severe, or extensive, as contused and lacerated wounds, involving a considerable amount of texture—the crushing of a limb, for instance. Burns present familiar and striking examples of extreme collapse, produced by this cause. Under this head, too, come capital operations. Injuries of very important organs, as the liver or other of the viscera, or of the joints, or other organs abundantly supplied with nerves. Pain alone, when intense and protracted, has proved fatal in this way; and it appears in

a case related by sir A. Cooper that sudden relief from great agony was attended by the same untoward result. Certain poisons operate in this manner, depressing the system so suddenly and severely as to produce a state of collapse; tobacco, for example; and drastic purgatives have in some cases induced a similar condition."

The effects of shock are aggravated by loss of blood; and hemorrhage alone, if sudden and profuse, will produce collapse. General debility and old age favor the influence of the shock, and much depends upon the idiosyncrasy of the patient; an injury which will produce no apparent effect on one man, often producing a serious and persistent impression on another.

The following are the most important points in regard to treatment: The patient should be kept in a horizontal position, with the head on the same level as the body, and he should not be raised till decided symptoms of reaction appear. The best stimulus is brandy, given in the form of hot brandy and water. "Its effects," says Mr. Savory, "are most certain and decided, and it suits the stomach best. It will remain when all other stimulants are rejected. The state of the circulation and the temperature are the guide to its use. If no effects are apparent after an ounce or two have been swallowed, it is very questionable if any advantage will be gained from a larger quantity." At the same time heat should be applied to the pit of the stomach and the extremities, by means of hot flannel, hot-water tins, or, in their absence, bottles containing hot water, and other appliances. Nourishment, in the form of beef tea, should closely follow the stimulants; the two may be combined with the greatest advantage, and as the system rallies, the latter may be entirely replaced by the former.

In those cases in which a patient is in a state of extreme collapse from an injury requiring a capital operation, such as the amputation of a limb, the operation should be performed as soon as his condition will admit of it; and although it should not be undertaken while the prostration is extreme, it is not necessary, or even advisable, in Mr. Savory's opinion, to wait for complete reaction; and this is the opinion of most of our best surgeons. Moreover, in these cases, the use of chloroform is not expedient; for, in the first place, it cannot be safely administered to a patient so depressed; and, secondly, the chief reason for its employment is wanting, for a person in a state of collapse is comparatively insensible to pain.

SHODDY formerly meant only the waste arising from the manufacture of wool; it now has a wider and much more important signification, and is almost wholly understood to mean the wool of woven fabrics reduced to the state in which it was before being spun and woven, and thus rendered available for remanufacture. Woolen rags, no matter how old and worn, are now a valuable commodity to the manufacturer; they are sorted into two special kinds, the rags of worsted goods and the rags of woolen goods, the former being made of *combing* or long-staple wools, and the latter of *carding* or short-staple wools. The former are those properly known as *shoddy-rags*, and the latter are called *mungo*. Both are treated in the same way; they are put into a machine called a *willey*, in which a cylinder covered with sharp hooks is revolving, and the rags are so torn by the hooks, that in a short time all traces of spinning and weaving are removed, and the material is again reduced to wool capable of being reworked. It was formerly used as a means of adulteration and cheapening woolen cloths, but it is now found of greater advantage in making a class of light cloths adapted to mild climates and other purposes.

The name is a purely technical one, which has arisen among the Yorkshire spinners, and is derived from *shed*, the term having been formerly applied by the operatives to the *flue* or waste shed thrown off in the process of spinning. During the civil war in the United States, it was discovered by the government, that some of the clothing furnished to the northern armies had been dishonestly made of shoddy, and as a term of reproach the term passed from military to civil circles, to be applied to parvenus whose social pretensions would not bear examination.

SHOEING OF HORSES. In olden times, horses generally went unshod, as they now do in many eastern countries; but our macadamized roads and paved streets, our fast paces and heavy loads, would speedily wear away the stoutest hoofs, and a rim of iron has accordingly been long in use as a protection. In style and pattern, the horse's shoe varies almost as much as his master's boot, and like it, when badly made, or unskillfully fitted, produces serious inconvenience, and even leads to accidents and diseases. When the feet are strong and properly managed, nothing is better than a plain shoe of tolerably uniform breadth and thickness, carefully fashioned to the shape of the foot. But many good authorities prefer what is called a seated shoe, which has a level part for the crust to rest upon, and within that the inner half of the shoe toward the sole surface is beveled off. This seated shoe is thus wider than the plain shoe, and hence affords greater protection for a weak or a flat sole. For faulty or diseased feet, special forms of shoes are suitable. In all healthy feet, the shoe should be fitted to the foot, and not, as is commonly done, the foot cut to fit the shoe. Another frequent error of keeping the shoe short and spare at the heels must be avoided. For roadsters the toe of the fore-shoes should be slightly turned up, which greatly obviates tripping. The hind-shoes are generally thickened, and sometimes turned down at the heels. The number of nails required must vary somewhat with the weight of the shoe and soundness of the horn; five is the minimum, nine the maximum. It is important, however, that the shoes be firmly held on by as few nails as possible. In a saddle-horse with

sound feet, three on the outside, and two on the inside, should suffice to hold a well-fitted shoe. Horses for heavy draught are generally shod in Scotland with tips and heels, which afford increased firmness of tread, and greater power, especially when dragging heavy loads. To preserve the foot in a sound state, the shoes should be removed every month. When the shoe is carefully taken off, the sole-surface on which it has rested should be rasped, to remove any ragged edges and any portions of adhering nails. Having for a month been protected from the wear to which the exposed portions of the foot are subjected, it will probably have grown considerably, and, in a stout hoof, will require to be cut down with a drawing-knife, especially toward the toe. Except in very strong feet, and in farm-horses working on soft land, the surface of the sole uncovered by the shoe seldom requires to be cut. It is the natural protection of the internal delicate parts, and must be preferable to the leather and pads often artificially substituted for it. The bars must likewise remain untouched, for they are of great service in supporting weight; while the tough, elastic frog must be scrupulously preserved from the destructive attacks of the knife, and allowed uninjured to fulfill its functions as an insensible pad, obviating concussion, and supporting weight. When the shoe is put on, and the nails well driven home, they should be broken off about an eighth or even sixteenth in. from the crust, and hammered well down into it. This obviously gives the shoe a much firmer hold than the usual practice of twisting off the projecting nail close to the crust, and afterward rasping down any asperities that still remain. When the shoe is firmly clinched, the rasp may be very lightly run round the lower margin of the crust, just where it meets the shoe, to smooth down any irregularities, but all further use of the rasp must be interdicted. The clinched nails, if touched, will only have their firm hold weakened; nor must the upper portions of the crust, which blacksmiths are so fond of turning out rasped and whitened, be thus senselessly deprived of those external unctuous structures, which render the unrasped foot so tough and sound, and so free from sandcracks. To prevent the hoof becoming too dry and hard, it is advisable, especially in roadsters, and in hot weather, to stop the feet several times a week with a mixture of equal weights of lard, tar, bees-wax, and honey, with about one-fourth part of glycerine, melted together, well stirred, and preserved in pots for use. Fuller details on this subject will be found in a little volume entitled *Notes on the Shoeing of Horses*, by Lieut.col. Fitzwygram, 15th (the king's) hussars; and in a paper on "Horse-shoeing," by Mr. Miles, published in the *Journal of the Royal Agricultural Society of England*, and reprinted in a separate form by Mr. Murray, Albemarle street, London.

SHOES—SHOE-TRADE. Clothing for the feet, whether in the form of sandals or shoes, has been in use in every country aspiring to civilization in ancient and modern times. The rudimentary shoe is a sandal consisting of a sole, held to the foot by straps and thongs. Such were the common Egyptian and Greek shoes, to which the shoes of the peasantry of the Abruzzi, in the s. of Italy, bear a close resemblance. In Egypt, however, the ordinary material for shoes were strips of the papyrus interwoven like a mat. As is seen from paintings on the walls of Thebes, shoe-making formed a distinct trade in the reign of Thothmes III., 1495 B.C., or about the period of the flight of the Israelites. The streets of Rome were encumbered with the stalls of shoe makers in the reign of Domitian. The shoe of the ancient Hebrews was a species of sandal. For ladies, the sandal, translated "shoe," in the Scriptures, was highly ornamental. "How beautiful are the feet with shoes, O prince's daughter" (Cant. vii. 1). Ornamented slippers are still a luxury in the east. The foot-coverings of the Romans were various in character, from the simple sandal and slipper to the boot, which extended up the leg. When the shoe covered the whole foot it was termed *calceus*; the calceus of a particular form and of great strength worn by the Roman soldier was known as *caliga*.

Reference is made in Scripture to different symbolical usages in connection with sandals or shoes. The delivery of a shoe was used as a testimony in transferring a possession: "A man plucked off his shoe, and gave it to his neighbor: and this was a testimony in Israel" (Ruth iv. 7). In cases of this kind, the throwing of a shoe on a property was a symbol of a new proprietorship or occupancy: "Over Edom will I cast my shoe" (Psalm lx. 8). From these ancient practices, in which the shoe was symbolical of contract, perhaps comes the curious old custom in England and Scotland of throwing old shoes for good luck after a bride and bridegroom on departing for their new home.

St. Crispin and his brother Crispinian have long been regarded as the patron saints of shoemakers. According to mediæval legend these personages were natives of Rome, and having become converts to Christianity, traveled into France and Britain to propagate the faith, everywhere supporting themselves by making shoes, which they sold to the poor at a very low price—one part of the legend being that an angel supplied them with leather. It is said that they suffered martyrdom in England toward the end of the 3d century. The memory of St. Crispin, of whom we chiefly hear, has, from time immemorial, been kept up by processions and other festivities in his honor on Oct. 25, which is known as "St. Crispin's day." Under this saintly tutelage, shoemaking has attained to the distinctive appellation of the "gentle craft," and is noted for the number of individuals who have risen from it to eminence. See an amusing but scarce work, *Crispin Anecdotes*; and a trade newspaper called *St. Crispin*. The sedentary and solitary nature of the craft, as hitherto conducted, has possibly had some influence in producing a degree of thoughtfulness, while the act of hammering his leather is calculated, as some

imagine, to stimulate the mental energy of the operative. If there be any real virtue in the sitting attitude of the shoemaker, a corresponding evil attends that method of carrying on his operations. In every profession, sitting at work in a close atmosphere is particularly injurious to health. Statistics assure us that out of 10,000 artisans who sit at their labor, 2,577 fall sick, and 95 die annually; while as regards an equal number of those who alternately sit and stand, only 1713 sicken and 61 die. To remedy this crying evil, a member of the profession, Mr. J. Sparks Hall, London, has invented a simple and inexpensive work-bench, at which shoes may be made standing. A few days practice, we are told, renders the workman as expert with the standing-bench as if he were seated according to the old plan, and he can execute closing with less fatigue and considerably more cleanliness. The only kinds of work at which sitting is more convenient are rounding the soles, lasting, and fitting. This standing-bench is, however, not much adopted by the men, who prefer old usages.

The fashion of shoes, as has occurred with other articles of dress, has undergone innumerable changes. At one time shoes were pointed to an extravagant degree; and in last century, the high heels of ladies' shoes became a monstrosity. Shortly after the beginning of the present century, the most marked improvement was the making of shoes right and left; the substitution of latches for buckles about the same period was also a step in advance. In our own day, the general disuse of the shoe proper, and the introduction of short ankle-boots, are the chief changes of fashion. A proposal for a more perfect adaptation of shoes and boots to the shape of the foot is noticed under Foot. The shoemaking trade, as at present conducted in Britain, is divided into two departments—the bespoke and the ready-made or sale business. The larger department hitherto has been that in which customers bespeak boots and shoes by having them made to measure; but it is generally giving way to the plan of buying articles ready-made. The cause of this is exceedingly obvious. The process of measuring is usually very imperfect, owing, among other reasons, to the want of lasts to suit every variety of feet, as well as the too general indifference to meet individual peculiarities. On this account, and even at the risk of purchasing an inferior class of goods, the public are becoming daily more disposed to encourage the ready-made trade. Accordingly large quantities of boots and shoes in innumerable varieties are now made and supplied wholesale by manufacturers for the retail dealers. Northampton, Stafford, and Leicester are considerable seats of this manufacture in England; and from certain districts in France, there are increasing exportations, chiefly of a cheap kind of ladies' shoes.

The plan of making boots and shoes by isolated workmen at their own homes has been found quite incompatible with the modern necessities of trade. As in the case of the hand-loom weaver, the shoemaker of the old school has had to succumb to machinery. After an unsuccessful struggle to oppose the introduction of sewing-machines, these are now coming generally into use, and men are employed in large numbers together in what may be called shoe-factories. Northampton and Stafford, the two chief of the centers just named, have unquestionably benefited by the introduction of the sewing-machine, although it deranged the relations between the masters and men for a time. An instructive and valuable exhibition of the leather and shoe trades was held at Northampton in 1873, illustrating the high pitch of excellence which these trades have now attained.

This manufacture has long been a staple trade of Massachusetts, in which state the quantity of boots and shoes fabricated annually is numbered by millions of pairs. An ingenious machine has been introduced into the American shoe trade for fixing the soles to the uppers by means of pegs, the inventor being a person in Salem, Mass. A pair of boots or shoes can be pegged in two minutes. These pegged goods are disposed of wholesale in boxes, and may be seen in retail stores all over the United States. As evidence of the important character of the shoe-trade in Massachusetts it may be mentioned that a few years ago there were as many as fifteen members of the "gentle craft" in the legislature of that state. Ingenious machines have also been introduced for fastening the soles to the uppers by means of fine screws. They were shown at the international exhibitions of 1862 and 1867 at work uncoiling lengths of wire, making the end into a screw, cutting off a small piece, piercing a hole in the sole, and screwing the wire therein.

There are no means of determining the extent of this trade in England or the United Kingdom.

The making of boots and shoes was one of the very earliest industries introduced into the American colonies, the town of Lynn, Mass., being noted for its practice from the time of the landing of its settlers. A letter from London, dated in 1629, refers to the sending of "hydes" on board the *Mayflower*, to two shoe-makers, who settled in Lynn. In 1855 there were 4,515 male, and 11,021 female operatives engaged in Lynn in the manufacture of shoes, producing to the value of \$4,000,000, this being prior to the introduction of the use of machinery in the trade. In 1890, with the machinery then in use, the number of employees were males 1,384 and females 607. With this reduction in the number of operatives, the production in 1890 reached \$19,474,500. [The displacement of human labor between 1865 and 1870 in the town of Lynn, by reason of the application of machinery, was 22 per cent in the case of the male, and 80 per cent in the case of the female operatives.] The value of the shoe manufacture in Massachusetts, Maine, and New Hampshire in 1890 was set down at \$138,709,245, that of New York city at \$18,979,259. In 1890, \$95,282,311 were invested in boot and shoe factory

industries in the U. S. There were 2,082 establishments employing 139,333 hands. The business of shoe-making was revolutionized in the ten years between 1861-71; the introduction of machinery which applied to every portion of the manufacture, having occurred within that period. The most important machines in use are the pegging machine; McKay sewing machine; Goodyear welt machine; cable-screw, wire, and wire-tacking machines, etc. The manufacture of shoes was for many years one of the principal employments of convicts in the state prisons, which were consequently made nearly self-supporting. Recently, however, the manufacture of shoes in prisons has been stopped in many states by statute. The principal shoe manufacturing towns in Massachusetts, after Lynn, are Haverhill, Marblehead, Worcester, Marlboro, Milford, Abington, North Abington and South Abington, the Bridgewaters, the Weymouths, Brocton, North Braintree, South Braintree, Brookfield, Medway, Beverly, Stoughton, Randolph, Quincy, and Danvers. In New Hampshire, Dover and Farmington are prominent, and in Maine, Portland, Auburn, and Lewiston. New York state is second to Massachusetts in the production of boots and shoes.

SHOLA, the white pith of the leguminous plant *æschynomene aspera*, a native of the East Indies. With this substance, which is exceedingly light, the natives of India make a great variety of useful articles, especially hats, which, being very light and cool, are in great request. Helmets made of shola are much used by the British troops in India.

SHOMER, JEBEL, a territory of central Arabia; pop. 450,000. It is a flat table-land, much of it desert with a few oases. On the e. border is a long valley called Wally Sirhan or Serhan, the common route for caravans to and from Syria. It contains the lake of Ittra, which supplies many of the adjacent provinces with salt. By means of artificial irrigation crops of grain, vegetables, and fruits are raised. A common article of export is ostrich feathers. There is considerable trade between Hayel and Medina. Horses, mules, and asses are exported. The capital is Hayel. It is in an extensive plain between Adja and Solma, inclosed by high mountains, and approached only by a narrow defile. Abdallah in 1818 made himself master of the whole district, and was succeeded by his son Telal in 1845, under whom it has become an independent sultanate.

SHOOTING STARS. See **AEROLITES**; **METEORS**.

SHORE. See **SEA-SHORE**.

SHORE, in ship-building, is a strong prop or stanchion placed under the bottom or against the side of a ship, to keep her steady on the slip or in dock. Shores are also used to support or prop up a building during alterations.

SHORE, JANE, 1445-1527; b. London; married a goldsmith of the name of William or Matthew Shore; mistress of king Edward IV., 1470, of lord Hastings, 1483. She received the offer of the hand of Thomas Lynom the king's solicitor, but Richard refused his consent. She was accused of witchcraft, and suspected of favoring the cause of the young princes. Openly charged with sorcery, by order of the duke of Gloucester, afterward king Richard III., she was committed to the Tower. Subsequently her property was confiscated, and she was sentenced by the bishop of London to do penance for her crimes. She lived until the accession of Henry VIII., and it is the popular belief that she died in penury and without a shelter.

SHORE, Rev. THOMAS TEIGNMOUTH, M.A., was born at Dublin, Ireland, in 1841; graduated at Trinity College in that city, with high honors in 1861, and subsequently acquired M. A. at Oxford. In 1865 he was ordained a clergyman; was successively curate of Chelsea and Kensington; then became incumbent of St. Mildred's See, and in 1873 was appointed incumbent of Berkeley Chapel, Mayfair. In 1878 he was appointed one of Queen Victoria's chaplains. He published *Some Difficulties of Belief*, and *The Life of the World to Come*; contributed to the New Testament Commentary of the Bishop of Gloucester and Bristol, and edited a series entitled *Helps to Belief*, writing the volume on "Prayer." He was made canon of Worcester in 1891.

SHOREDITCH is a district in London located in the borough of Hackney, which has always borne an immoral reputation. It was probably first named Soersditch after Sir John Soersditch, a lawyer who lived there in the time of Edward III. Tradition, however, is fond of ascribing its name to Jane Shore, a beautiful woman, wife of a prominent goldsmith of that vicinity, and who was greatly beloved by Edward IV. The two theatres of London during Shakespeare's time, were located in Shoreditch. They were looked upon as perfect centres of vice, and were much inveighed against by the writers of that time.

SHOREHAM, NEW, sea-port, and till 1885 a parl. borough of Sussex, on the left bank and at the mouth of the Adur, 6 m. w. of Brighton. The town arose when the harbor of Old Shoreham, now a m. inland, became silted up. Pop. of the parish '91, 3393. Ship building is carried on here on an extensive scale, and the trade of the port is considerable, principally with France and the coast. The harbor is not very good, being inaccessible at low tides. The parliamentary borough included the *Rape* (see **SUSSEX**) of Bramber, and had a pop., in 1881, of 42,442.

SHORT, CHARLES, LL.D., born Mass., 1821, graduated at Harvard college in 1842; assistant teacher in Phillips academy in 1847; master of the Roxbury classical school,

1847-53, and of a private classical school in Philadelphia, 1853-63; professor of mental and moral philosophy in Kenyon college, Ohio, and its president, 1863-67; succeeded Dr. Drisler as professor of Latin in Columbia college in 1868. His publications are *Advanced Latin Exercises* in Schmidt's and Zumpt's classical series; *New Ancient Geography*, revised; an essay on the *Order of Words in Greek*. He translated articles from the German for Herzog's *Real Encyclopædia*, and his contributions to the *Bibliotheca Sacra* and other reviews were numerous. He was one of the American committee of revisers of the English Bible. He d. 1886.

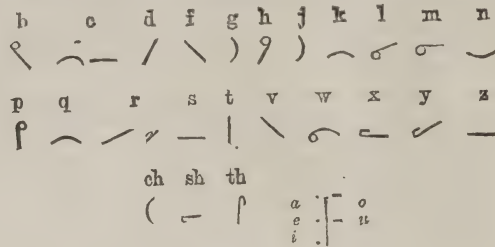

SHORT, WILLIAM, 1759-1849; b. Va.; educated at William and Mary college. In 1784 he was secretary of legation when Jefferson was minister to France. He was successively *chargé d'affaires* at Paris, minister at the Hague, and (1792-95) at Madrid. He was the first American citizen appointed to office under the constitution.

SHORTHAND (TACHYGRAPHY, BRACHYGRAPHY, STENOGRAPHY, PHONOGRAPHY).—The foregoing are names that have been applied to systemic brief writing, a large number of systems or descriptions of which have been invented and practised. Palæographers have expended much study on the subject of the invention and practice of the art among the ancients; the result of their investigations pretty conclusively establishing that the Romans were the first who produced anything to which the name, in the sense in which we now use it, can appropriately be applied. Dr. Zeibig, perhaps the most learned of living writers on the subject, claims (*Geschichte der Geschwindigkeitkunst*) that Kopp (*Palæographica Critica*) has proved that the Roman S. was not borrowed from the Greek; a view, however, still somewhat controverted. The Tironian notes, supposed to have been invented or perfected by Tiro, Cicero's freedman and amanuensis, was a system of abbreviated writing that was employed quite extensively while he lived, and still more so for several generations immediately succeeding. Evidently it was not employed with much success in the reporting of orations or addresses, however well adapted to dictation work. No ms. of Tironian notes supposed to have been written earlier than the 7th or 8th century has been found. Specimens still exist in various European libraries. In the 10th century knowledge of the Roman S. apparently disappeared. The Greek S., of specimens of which Kopp cites two, one in the Vatican library, the other at Paris, has also been the subject of research, but not with important results. Only a very remote relation between it and the Roman is traceable. Both systems employed abbreviated letters, apparently parts of the letters of the Greek and the Roman alphabet—in other words, *majuskeln*. A letter of John of Tilbury, an English monk, written *circa* 1174, indicates that he knew something of the Tironian notes. Bright's *Characterie* (1588), printed posthumously, was the first of a very long list of books and systems which the English mind has produced. Two S. bibliographies in English have been recently published: (1) Julius Ensign Rockwell's *Teaching, Practice, and Literature of Shorthand*, Circular of Information, U. S. Bureau of Education, 1884, the bibliography occupying 88 pp., with engraved reproduction of 88 alphabets; (2) Dr. J. Westby Gibson's *Bibliography of Shorthand*, pp. 246, 12mo (London and Bath, 1887). Reference is made to these; also to Dr. Zeibig's work, before mentioned, which contains an extensive bibliography, not limited to works in English. A translation (Heffley) of the historical part was printed by the New York State Stenographers' Association in their *Proceedings*, 1887. The *Transactions* (London, 1888, pp. about 500) of International Shorthand Congress, Sept., 1887, contain a mass of valuable information, historical, bibliographical, literary, and practical. The International Congress was nominally a tercentenary celebration of the publication of Bright's *Characterie*, 299 years before. The study of the subject in all its aspects and relations has recently greatly broadened.

John Willis, whose 8th ed. (1623) is referred to by Lewis in his *History of Shorthand* (1816), claims that his own art of stenography "was the first that ever gave direction for any form of spelling characterie." His alphabet and those of all known early English systems contained many compound characters or signs for the letters, disregarding the primary requisite of brief writing—the use of the fewest possible marks to represent the respective letters or elementary sounds. Though failing in this, Willis comprehended and applied the phonetic or "writing-by-sound" principle, now so almost universal in S. Mason (1672), Nicholas (1692), Weston (1729), Aulay Macaulay (1747), and Gurney (1750) exhibited various degrees of alphabetical simplicity. The development of Gurney's system, by himself and his successors, has been carried on with much intelligence and ingenuity; it is still the official system in the British parliament; has distinguished practitioners in different English law courts, and several among the legal writers in the U. S. Gurney employed, to a limited degree, what one of the latest of S. inventors calls the "vowel modes"—"taking off the pen and placing the next consonant in a particular [relative] position," to indicate intervening vowel sounds. This Lewis characterizes as "the worst of all methods," a statement which advocates of the Gurney system would dispute, and which writers of the modern Everett system (1877) would stoutly controvert. Byrom (1767) employed simple forms, beginning his signs for ten letters, however, with circles, a device often of advantage, as facilitating joinings. Blanchard (1779) presented an alphabet of simple forms; so also did Taylor (1786), whose alphabet is given below.

It should be said of Taylor's system, that it has been its fortune to undergo adaptation, by various hands, to the representing of several continental languages. Amanti, an

Italian, adapted it to his own language, which adaptation, as modified by Delpino, is now used by the official reportorial corps of the Italian chamber of deputies. In Spain, when Marti's system, the one most practised there, was first presented, it was avowedly as an adaptation of Taylor; so, also, the Guerra system. That of Marti has been much modi-

TAYLOR'S ALPHABET.

fied, and has been adapted to Portuguese. South American peoples speaking that tongue and the Spanish have made considerable use of S. In Mexico the proceedings of both legislative houses are reported stenographically. Adaptations of Taylor's system have been made to French, Dutch, Swedish, German, Roumanian, and Hungarian.

The development of the *phonetic* idea in connection with S. is traceable from John Willis (1602) through various systems. It reached a very complete expression in Nelson (*Parliamentary and Forensic Shorthand Writer*, 1836), who says, p. 22: "In spelling, you must be guided entirely by sound, and not by the orthography of the language in which you write." His system was that of Taylor somewhat modified. But Nelson could not completely carry out this theory; he could only represent the vowel sounds orthographically—e.g., t-h-o, *though*; t-h-a, *they*. Three years before, in 1833, had been published, at Preston, England, a work which its author, Thomas Towndrow, who had recently gone thither from America, called "a new and comprehensive system of representing the *elementary sounds* of the English language in stenographic characters." Towndrow presented signs for the *different sounds* of a, e, i, o, u, which signs were connectible strokes. When Mr. Pitman, a few years later, presented his system, now termed "phonography," he also gave an alphabet of *sounds* instead of letters. For his consonant signs he adopted simple strokes, straight and curved; for the vowel sounds, detached ticks and dots—necessary, however, to be omitted in brief writing, such omission being imperfectly provided for (imperfectly, because without approach to exactness) by writing the consonant strokes in various positions relatively to the line of writing.

This author has written and published a large number of instruction books of various grades, some of which have had sales to the extent of hundreds of thousands of copies. In England the author is the publisher of all instruction books in the system; he maintains his copyright strictly; hence, modifications of it, except such as he approves, are not published there. In the U. S., however, several series of text-books, containing more or less radical variations, have appeared—those of Benn Pitman, Graham, Munson, Osgoodby, Mrs. Burnz, Thornton, Longley, Scott-Browne (not to, at present, mention Bishop's *Exact Phonography*), being the most noteworthy. Among the expert professional parliamentary and law court S. writers in London, those who use the older systems of Gurney, Taylor, and Lewis rather outnumber, together, the disciples of Pitman; but in America nearly all such writers use some form or adaptation of the Pitman phonography. The number of schools in the U. S., and in the United Kingdom and its various colonies, in which this system is taught in some form, is very large. Something has been done in England, Scotland, and Ireland towards introducing it as a branch of higher common school education. It has recently been compelled to compete with the newer Everett and Sloan-Duployan systems, which, however inferior in the brief and easy representation of the *consonant* sounds, claim an advantage over it in their modes of vowel representation. The *consonant* part of the Pitman system embodies principles of abbreviation in great perfection, by its hooks, circles, and loops, all of two sizes, with halving and lengthening. The two engraved lines in part illustrate this:

In the U. S., in which S. is very extensively made use of, not only in the courts and in legislative bodies—in both of which the highest ability is required—but for amanuensis or clerical purposes, this system, in its various forms, has greatly the ascendancy. It is taught in many institutions, more particularly in commercial and business schools, and by teachers who devote themselves wholly to teaching it, by correspondence, in classes, or privately.

The distinguishing features of the principal American adaptations of the Isaac Pitman system may be briefly summarized. The *Graham* aims at greater brevity; it often gives shorter (and at the same time less markedly differentiated) word forms or grammalogues than does the original Pitman; it claims to abbreviate and phrase somewhat more systematically; it introduces an increased number of abbreviated forms that have to be well memorized. The criticism often made upon it is that it is the most difficult to learn; that its writers often, when practitioners, drop its more intense abbreviations, finding the use of them a burden to the memory and a hindrance to legibility. The *Munson*, adopting large and small initial hooks on curved strokes, in accordance with a device invented by Charles E. Wilbour, a former well-known New York city journalist and law stenographer, claims to have much simplified the arrangement of initial hooks, as compared with Graham, and rendered the art easier to be acquired. It contains, however, relatively more heavy or shaded strokes than the Graham. The *Benn Pitman* is very similar to what the works of Isaac Pitman have at times shown his own often-modified system to be, its *initial* hook arrangement being more like the Graham adaptation. The *Burns* quite closely resembles the Munson as to the hooks, but varies some diphthongal signs, and contains additional devices to show whether first indicated vowel sounds precede, or follow, those of initial consonant strokes. The *Longley* claims to be "eclectic;" appropriating and incorporating whatever the author thought best in all the others. It is a serious question whether such incorporations have always been judiciously or consistently made. The *Osgoodby* makes important changes in the signification of the *final* hooks, the advantage of which is far from generally conceded. The *Thornton* emphasizes the desirability of avoiding, where not absolutely necessary, all shading of strokes, i.e., it is, so far as practicable, a "light-line" system. The above are the most characteristic adaptations that retain the old vowel representation by detached signs and by "position."

In the U. S. it is said that in 1882 there were 276 educational institutions in which S. was taught, such teaching being mainly of the above-mentioned adaptations, and the Isaac Pitman (excepting the Osgoodby, which is more recent). A few use J. George Cross's *Eclectic* (an orthographic, not a phonographic, system), Takigraphy, the Scovill, the Gabelsberger, Pernin-Duployé, and two or three others less known. Similar statistics as to the United Kingdom and its colonies are not accessible. Of works on S. known to the Stenographic Institute, Dresden, the number, in 1883, was reported to have been 3295; Latin, 91; English, 780 (later report, 923)—370 of them Pitman, or modifications of that system; Welsh, 8; French, 490; Spanish, 71; Portuguese, 16; Italian, 151; Roumanian, 6; Slavonian, 3; Bohemian, 33; Russian, 52; Polish, 22; Slovenian, 3; Croatian, 7; Bulgarian, 4; Hungarian, 75; Finnish, 1; Danish, 7; Norwegian, 1; Swedish, 22; Greek, 3; Turkish, 1; Dutch, 14; German, 1434—684 relating to the one system of Gabelsberger, 482 to that of Stolze. Rockwell's bibliography or list, of systems and text-books in English alone, gives nearly 500. There are many S. societies and associations in these countries—many in the English speaking, including a considerable number in the U. S. Germany stands at the head, however, in this, having had, in 1887, about 1000, with a membership of 23,000—11,210 members writing Gabelsberger, 7798 Stolze, 1140 Arends, 1206 Roller. In Austria and Switzerland the number is very much smaller, but showing an aggregate, in both, of 94 societies, with nearly 2000 members.

In France several systems are in use, the modifications of Taylor by De Prépean—which has also been adapted to Latin by Bossuyt and to Dutch by Steger—apparently being the most generally used. Prevost, Senocq, and Duployé are also well-known names. The earliest known French stenographic author was Jacques Cossard (1651), a copy of whose work the writer of this article has examined.

In Germany the principal systems are the Gabelsberger, the Stolze, the Arends, and the Roller. The two first mentioned are far the most used. They are what are known as *script* systems—the strokes not being struck in all practicable directions, as are those of the English systems, but conformed, as far as possible, to the inclination or slant of the ordinary script—the strokes being much varied in length, variously shaded, and otherwise variously treated to secure the needed differentiation of form. Since the introduction of these systems, the growth of the art in Germany has been very rapid. It is a subject of lectures in, e.g., the University of Berlin.

The *Sloan-Duployan* system, now coming into use in England and somewhat in the U. S., is one of the new systems that aims at greater exactness. It seems to be a simple system to learn, and to attain, to a good degree, the object it aims at. A few of the angles and combinations seem to be too difficult of execution to be practicable for the most rapid work. The *Pernin* is also demanding recognition and receiving attention.

The *Everett* system (1877) is also one of the new ones, constructed with special reference to the attainment of exactness of vowel representation, as well as consonant. In addition to introducing a system of connectible vowel strokes, it introduces an elaborate system of vowel *indication*, called the "vowel modes," *implying* intervening vowel sounds, instead of writing the signs for them; doing this by varying the length of the preceding consonant stroke, or writing the succeeding one at different distances from, or touching or intersecting the preceding, or placing it in such relations to the beginning, the middle, or the end, of the preceding one. Its author claims for it great legibility;

the main question concerning it arises in connection with its disconnectedness, and as to whether it possesses sufficient brevity for rapid *verbatim* work.

The system of *Legible Shorthand*, the work of Mr. Edward Pocknell, London, also aims at securing a more certain vowel *indication* than the Pitman secures. Mr. Pocknell's strokes are of different lengths (and hence cannot be half- or double-lengthened), and are curved in different ways to secure particular indications. It apparently merely lessens, without entirely overcoming, the Pitman ambiguity as to vowel sounds.

The newest and perhaps most revolutionary work that has appeared is *Exact Phonography* (1887), by George R. Bishop, of New York City. He claims to have introduced a system of perfectly distinguished *vowel strokes*, and to have treated them in analogy with the well-known unambiguous Pitman treatment of the *consonant* strokes; that thereby a system of vowel representation, as exact as the consonant, is secured, the possibility of representing any vowel, as well as any consonant, sound with a similarly treatable connectible sign, also conducing to an equally rapid representation of the vowel sounds; that such treatment renders the writing of S. more a matter of constant application of well-known principles to easily manageable material, than of memorizing many semi-arbitrary forms; that this harmonization of vowel and consonant treatment greatly simplifies the science, renders it easier of acquisition, and more useful when acquired, because languages other than English can readily be phonetically represented by it; that by this extension of the consonant treatment to the vowel strokes, the necessity for an extra or additional mode of vowel representation, such as are the Pitman device of "position," the Everett of the "modes," is avoided. The system adopts, with a few changes, the Pitman consonant signs, and introduces a complete set of connectible strokes for both the vowel and the consonant sounds of ordinary speech.

In England, where modern S. was invented and first put to practical use, it was apparently first brought into requisition prominently in connection with legal proceedings; this long before it was used in parliament, and while a daily press was unknown. Its greatest use, for the producing of *verbatim* records, in that country, is still as incident to legal proceedings or quasi-legal—committee hearings, investigations, etc. In America it was quite early employed in reporting debates in congress, where it is still used in the making of elaborate and nearly *verbatim* records, a practice that also obtains in the legislatures of some of the individual states. But the largest field of practice that the thoroughly expert writers of S. find, in the U. S., is the legal; most of the states and territories having now, by legislation, provided for the appointment of official writers for rapid taking of testimony and judges' charges. In the courts of the various states, of both superior and inferior jurisdiction, the number of such official appointees must be two or three hundred. In the principal British colonies, probably the official *legal* reporting by stenographers exceeds in magnitude all other kinds—e.g., in Ontario, province of Quebec, other parts of British N. America, Australia, India, New Zealand. In the Dominion of Canada, the debates in parliament at Ottawa are carefully reported by men who are skilled and competent, provision being also made for reporting the few speeches that are made there in French. In continental countries there has been a much stronger relative tendency to utilize the art for legislative and assembly reporting. In France, Germany, Holland, Italy, Belgium, the Scandinavian countries, Bulgaria, this has been so, though in the last-named country some of the more important proceedings in the law courts are stenographically reported. In the German empire little progress seems to have been made in this direction.

SHORTHOUSE. JOSEPH HENRY, author, b. Birmingham, Eng., 1834; educated at private schools. He is author of *John Inglesant*, a remarkable historical romance (1881); *The Platonism of Wordsworth* (1881); an edition, with prefatory memoir, of George Herbert's *Temple* (1882); *The Little Schoolmaster Mark* (1883); *Sir Percival* (1886); *A Teacher of the Violin* (1888); *The Countess Eve* (1889); *Blanche, Lady Falaise* (1891).

SHORT-SIGHT. See SIGHT, DEFECTS OF.

SHOSHONE, a co. in n. Idaho, having the Bitter Root mountains for its e. and n. boundary, separating it from Montana; 4400 sq.m.; pop. 1890, 5382. Co. seat, Murray.

SHOSHONE, or SNAKE, RIVER. See IDAHO.

SHOSHONES, or SNAKES, a family of North American Indians, inhabiting the territory between the Sierra Nevada and the Rocky mountains, the s. part of Idaho, and the n. of Utah. They are divided into the Shoshones proper, the Utes, Comanches, and six other tribes. The Shoshones proper include the Bannacks. They came from the s., and gradually drifted towards the Rocky mountains. The Salt Lake Diggers were nearly exterminated in a battle on Bear river in 1862. In 1863 peace was made with most of the tribes, after years of open war, by Gen. Augur at fort Bridger. All but the Comanches, who have been settled in Indian territory, are on reservations, in Idaho, Wyoming, Nevada, and Utah.

SHOT is the term applied to all solid balls fired from any sort of firearms; those for cannon and carronades being of iron, those for small-arms, of lead. The latter are known as bullets and small-shot. The shot used for guns at present vary from the

3-pounder, for boat and mountain artillery, to the 13-in. shot, which weighs about 300 lbs. as a shell, or 700 lbs. as an elongated bolt. Generally, shot are cast. There are simple practical rules for calculating the weight of *spherical* shot from the diameter, and *vice versa*, which are often useful in reading of artillery actions. Given the diameter in inches, to find the weight in pounds: Cube the diameter, and multiply the result by 14; reject the two right-hand figures; those remaining give the weight in pounds.—Given the weight in pounds, to find the diameter in inches: Multiply the cube-root of the weight by 1.923, and the result is the diameter of the shot in inches.

Small-shot is of various sizes, from swan-shot, nearly as large as peas, to dust-shot. It is made by dropping molten lead through a colander in rapid motion from a considerable height into water. The lead falls in small globular drops. The holes in the colanders vary in size according to the denomination of the shot, No. 0 requiring holes $\frac{7}{16}$ in. in diameter, No. 9, $\frac{3}{32}$ inch. The colanders are iron hemispheres, 10 in. in diameter, and are coated within with the *cream* or scum which is taken off the molten metal. A small portion of arsenic is melted with the lead, and the fusion in the colanders is maintained by those vessels being surrounded by burning charcoal. The discovery of the advantage attending a long fall was made in England toward the end of last century. Previously the shot had dropped from the colanders at once into the water. The lead was then so soft that the shot were flattened by the water. The fall through the air enables the lead to cool and harden before taking its plunge. The smaller sizes require less fall than the larger—100 ft. suffices for sizes Nos. 4 to 9—the larger sorts demand 150 feet. The highest shot tower is at Villach, in Carinthia, where there is a fall of 249 feet. After cooling, shot is sifted in successive sieves to separate the sizes. Misshapen shot are found by their inability to roll; and finally, the whole are polished by rotary motion in small octagonal boxes, in which a little plumbago has been thrown. See also CASE-SHOT or CANISTER-SHOT, GRAPE SHOT, and BAR SHOT.

SHOTTS, a small and ancient village of Lanarkshire, close to the Kirk of Shotts, about 16 m. e. of Glasgow. About 3 m. to the s.e. of the Kirk, modern Shotts, or Shotts proper, began to rise at the close of the last century, when the Shotts Iron company erected their extensive iron-works there. Shotts may be said to consist of three villages—viz., Stane, Shotts Iron-works, and Dykehead, of which the united population in 1881 was 2,985. In the same year the population of the civil parish of Shotts was 11,214. Valuable coal and ironstone, peculiarly suited for the manufacture of iron abound in the district, and a large number of workmen are employed in iron-making and molding. Until recently there was no railway communication from and to Shotts for passengers; but since the opening of the Clelland and Midcaldor branch of the Caledonian railway, Shotts forms the half-way station between Edinburgh and Glasgow on that line.

SHOULDER-JOINT, **THE**, is a ball-and-socket joint. The bones entering into its composition are the humerus or arm-bone, and the scapula or shoulder-blade, the large globular head of the former being received into the shallow glenoid cavity of the latter, an arrangement by which extreme freedom of motion is obtained, while the apparent insecurity of the joint is guarded against by the strong ligaments and tendons which surround it, and above by the arched vault formed by the under surface of the acromion and coracoid processes. See **SCAPULA**. As in movable joints generally, the articular surfaces are covered with cartilage, and there is a synovial membrane which lines the interior of the joint. The most important connecting medium between the two bones is the capsular ligament, which is a fibrinous expansion embracing the margin of the glenoid cavity above, while it is prolonged upon the tuberosities of the humerus below. From its relations with the surrounding muscles, the ligament derives much of its strength. Accordingly, in paralysis of the arm, one or two fingers can often be pressed into the joint toward the head of the glenoid cavity, from which the head of the humerus is now separated.

The shoulder-joint exhibits the following varieties of motion: 1. Flexion, to a great extent; 2. Extension, in a much more limited degree; 3. Adduction, in an oblique direction, forward and inward; 4. Abduction, very freely; 5. Circumduction; and 6. Rotation slightly.

The morbid affections of the shoulder-joint may be divided into (1) those arising from disease, and (2) those dependent on an accident. The most common diseases are acute and chronic inflammation of the joint, which often terminate in its ankylosis or immobility. The principal accidents are fractures and dislocations. There may be fracture (1) of the acromion process, or (2) of the coracoid process, or (3) of the neck of the scapula, or (4) of the superior extremity of the humerus; or two or more of these accidents may be associated. Again, the head of the humerus may be dislocated from the glenoid cavity as the result of accident in three different directions—viz. (1) Downward and inward into the axilla, which is by far the most common form; (2) Forward and inward; and (3) Backward on the infra-spinous fossa, or the dorsum of the scapula. The first of these varieties is of such common occurrence that persons of ordinary intelligence should know how to recognize, and even (in an emergency) to treat it. The following are the most prominent symptoms: "The arm is lengthened; a hollow may be felt under the acromion, where the head of the bone ought to be; the shoulder seems flattened, the

elbow sticks out from the side, and cannot be made to touch the ribs; and the head of the bone can be felt if the limb be raised, although such an attempt causes great pain and weakness from the pressure exerted on the axillary plexus of nerves."—Druitt's *Surgeon's Vade-mecum*, 8th ed. p. 282. There are at least five methods of treating this form of dislocation. It is sufficient to notice two of them. 1. Reduction by the heel in the axilla. The patient lies on a couch, and the operator sits at the edge and puts his heel (the shoe or boot being previously removed) into the axilla, to press the head of the bone upward and outward, and at the same time pulls the limb downward by means of a towel fastened above the elbow. 2. Reduction by the knee in the axilla. The patient being seated in a chair, the surgeon places one of his knees in the axilla, resting his foot on the chair. He then puts one hand on the shoulder to fix the scapula, and with the other depresses the elbow over his knee.—For a description of the symptoms and mode of treatment of the other forms of dislocation, see any systematic treatise on surgery. See *illus.*, ANATOMY, vol. I.

SHOVELER, *Rhynchaspis*, a genus of ducks of the section having no lobe or pendent membrane on the hind toe, and remarkable for the expansion of the end of the mandibles in adult birds, particularly of the upper mandible. The lamellæ of the mandibles are long and very delicate. The legs are placed near the center of the body, so that these birds walk much more easily than many of the ducks. The common shoveler (*R. clypeata*) is smaller than the wild duck, but rather larger than the widgeon. The shoveler is a winter visitant of Britain, but not very common. A few remain all the year. It is widely distributed over Europe, Asia, and North America. Its flesh is very highly esteemed. A species of shoveler is found in Australia.

SHOW-BREAD. See SHEW-BREAD.

SHOWERS OF FISHES have occasionally fallen in different parts of the world, exciting great astonishment. Instances of this kind have occurred in Britain. A few years since, a shower of small three-spined stickle-backs fell near Merthyr-Tydvil in Wales, sprinkling the ground and house-tops over an area of at least several square miles. They were alive when they fell; yet if caught up by a whirlwind from any of the brackish ponds near the sea, in which this species of fish abounds, they must have been conveyed through the air a distance of almost thirty miles. Another similar instance occurred at Torrens, in the isle of Mull, in which herrings were found strewed on a hill five hundred yards from the sea, and 100 ft. above it.

Showers of fishes occur much more frequently in those tropical countries where violent storms, sudden gusts of wind, and whirlwinds are most common. In India, a shower of fishes varying from a pound and a half to three pounds in weight has been known to fall. Sometimes the fishes are living, more frequently they are dead, and sometimes dry or putrefying. They are always of kinds abundant in the sea or fresh waters of the neighborhood; and it cannot be doubted that they are carried up into the air by violent winds or whirlwinds; although they sometimes fall at a considerable distance from any water which could supply them. The sudden reappearance of freshwater fishes in ponds which have been dried up for months in tropical countries, is often popularly ascribed to their falling from the clouds; but the truth is, that they have been buried in the mud below, existing probably in a state analogous to that of animals in cold climates during hibernation. A pool, the bottom of which has long been dry, and on which grass has grown and cattle have walked, is again filled with fishes in a few hours after it is filled with water.

SHRAPNELL SHELL. See SHELLS.

SHREVE, HENRY MILLER, 1785-1854; b. N. J. Capt. Shreve was one of the first to engage in steam navigation in the west, and for nearly 40 years was connected with the river commerce of that section. He was the inventor of the steam "snag-boat," and for several years held the position of U. S. inspector of western river improvements. In the war of 1812 he had charge of various fortifications on the Mississippi, and in the battle of New Orleans did effective service as capt. of artillery.

SHREVEPORT, city and judicial seat of Caddo parish, La.; on the Red River and the Houston and Shreveport, the Queen and Crescent route, the St. Louis Southwestern, the Texarkana and Fort Smith, and the Texas and Pacific railroads; 326 miles n.w. of New Orleans. It is one of the most important interior cities of Louisiana, being in the midst of a great cotton-growing and stock-raising section, and besides its railroad advantages, having water communications of great value. There are a U. S. government building, high school, Thatcher institute, state charity and U. S. marine hospitals, cotton exchange, board of trade, national, state, and private banks, gas and electric lights, electric street railroads, improved sewerage, fine waterworks, and daily and weekly newspapers. The site of the city was given to Larkin Edwards by the Caddo Indians, who had been befriended by him, in 1835, and he sold it to a syndicate who obtained a city charter in 1839. For many years its principal interests were those connected with the cotton industry; but, while holding its own in this respect, it has become an important cattle, sheep, manufacturing, and general trade center. It has cotton compresses, cotton seed oil mills, cotton gins, manufactories of cotton machinery and ice, and an extensive trade in cotton, livestock, wool, and hides. Pop. '90, 11,979.

SHREW, *Sorex*, a genus of small quadrupeds of the family *soricidæ*. They are often popularly confounded with mice and rats, but are really very different, having insectivorous and not rodent teeth. The head is very long; the snout elongated, attenuated, and capable of being moved about; the eyes small; the tail long; both body and tail covered with fine short hair; the feet have a broad sole and 5 toes. The genus has recently been sub-divided, and the British species belong to more than one of the subdivisions. The COMMON SHREW of Britain (*S. or corsia vulgaris*) was, until recently, confounded with *S. araneus*, a species common in continental Europe. It is nearly $2\frac{1}{2}$ in. in length from the snout to the root of the tail, the length of which is about $1\frac{1}{2}$ inches. It abounds in dry fields, gardens, and hedge-banks; feeding chiefly on insects and worms, for which it grubs with its long snout among the roots of the herbage. It burrows, and makes long runs just under the surface of the ground. It is an excessively pugnacious little animal, and the males have fierce combats in spring, in which many are killed. Cats kill the shrew, but do not often eat it, probably on account of its strong musky smell; but it is the prey of weasels, hawks, owls, and shrikes. Harmless and inoffensive as it is, it has long been very generally regarded with dread and aversion by the vulgar. (See White's *Natural History of Selborne*.)—Another and even smaller species, *S. pygmaeus*, is found in Ireland, where it is called the shrew mole.—The WATER SHREW (*S. fodiens* or *crossopus fodiens*) is larger than the common shrew, being fully 3 in. long, and the tail 2 inches. It is of a blackish-brown color, gray or white on the underparts. It burrows in the banks of streams, and is very aquatic in its habits. It is found in many parts of Britain.—Some of the Indian species of shrew attain a much larger size, as that called the musk rat (q.v.). There is an Italian species which is the smallest of all known mammalia. It is only about $1\frac{1}{2}$ in. in length, exclusive of the tail, which measures about 1 inch. See illus., BATS, ETC., vol. II.

SHREW-MOLE, *Scalops*, a genus of insectivorous mammalia of the family *talpidæ*, and very nearly allied to the moles. There are 6 incisors, 2 canine teeth, 8 false molars, and 6 true molars in each jaw. The ear is destitute of auricle; the eyes are very small, and much concealed; the feet are 5-toed, the fore-feet large, as in the mole. The whole figure, and also the habits, resemble those of the mole.—There are several species, all natives of North America.

SHREWSBURY, a town in Monmouth co., N. J.; on the Shrewsbury river and branches of the Central of New Jersey railroad; 35 miles s. of New York. It was settled in 1664, and contains the ancient Anglican church with the crown of England on the vane, a public library, electric railroad, and a noted tomato catsup factory. Pop. '90, 8367.

SHREWSBURY, a parliamentary and municipal borough and market t., the capital of Shropshire, stands on the Severn, by which it is nearly surrounded, 163 m. n.n.w. of London by the London and Northwestern railway. It is irregular in plan, contains many inferior houses, partly built of timber, but often of very picturesque appearance. In the modern quarters the houses are handsome and regular. St. Mary's church was founded in the 10th century. There are a market house (1595), the shire hall (rebuilt 1883), and the new market hall (1868). The town contains interesting remains of the ancient walls, the castle, two monasteries, and a Benedictine abbey. The remains of the abbey church now form the church of Holy Cross. There are other ecclesiastical edifices, a free school, which is considered one of the seven great public schools of England; a number of other important schools, institutes, hospitals, etc. There are manufactures of agricultural implements and linen thread, iron foundries, and works for glass staining and malting. Shrewsbury returns one member to parliament. Pop. '91, 29,967.

Shrewsbury, called by the Welsh Pengwern, was named by the Anglo-Saxons *Scrobbes Byrig*, and of this the modern name is a corruption. The town connects itself intimately with the history of the country from the 12th to the 17th century. It was taken by Llewellyn the Great, Prince of North Wales, in 1215, during the disturbances between king John and the barons; and in 1403 Henry IV. here defeated the insurgent Percies and their allies with great slaughter. It was taken by the parliamentarians in 1645.

SHRIKE, or BUTCHER-BIRD, *Lanius*, a genus of birds of the family *laniadæ*, approaching more nearly in character to the *falconidæ* than any other of that family; having a short, thick, and compressed bill, the upper mandible curved, hooked at the tip, and furnished with a prominent tooth, the base of the bill beset with hairs, which point forward. The species are numerous, most of them natives of warm climates, although some occur in the more northern parts of the world. They prey on insects and small birds, and have a remarkable habit of impaling their prey on thorns; so that the nest of a shrike may be discovered by the numerous insects impaled in the neighborhood of it. Shrikes kill and impale many insects which they never eat, leaving them to dry in the sun; and in confinement they make use for this purpose of a nail, if provided with it, or stick portions of their food between the wires of the cage. They can imitate in some degree the notes of many birds, particularly those which are the utterance of distress, and they seem to make use of this power in order to attract birds within their reach. The most common British species, rarely seen, however, except in the s. of Eng-

land, is the **RED-BACKED SHRIKE** (*L. collaris*), a bird only about $7\frac{1}{2}$ in. in length, about a third of the length being formed by the tail, which is square at the end. Insects are the chief food of this bird, but it also preys on small birds, young frogs, and even young pheasants.—The **GREAT GRAY SHRIKE**, or **SENTINEL SHRIKE** (*L. excubitor*), is about the size of a thrush. It is a rare bird in Britain, but common in some parts of Europe, and is found also in Asia and North America. It was formerly used by falconers in catching hawks, of which it is greatly afraid, screaming loudly on their approach; the falconer waited in concealment, after fastening some pigeons and a shrike to the ground, until the scream of the shrike gave him notice to pull the string of his net.

SHRIMP, *Crangon*, a genus of crustaceans, of the order *decapoda*, suborder *macrouræ*, and family *crangonidae*, allied to lobsters, crayfish, and prawns. The form is elongated, tapering, and arched as if hunch-backed. The claws are not large, the fixed finger merely a small tooth, the movable finger hook-shaped. The beak is very short, affording a ready distinction from prawns. The whole structure is very delicate, almost translucent; and the colors are such that the creature may readily escape observation, whether resting on a sandy bottom or swimming through the water. The quick darting movements of shrimps, like short leaps, however, betray them to any one who looks attentively into a pool left by the retiring tide on a sandy shore. When alarmed, they bury themselves in the sand, by a peculiar movement of their fanlike tail fin.—The **COMMON SHRIMP** (*C. vulgaris*) is very abundant on the British coasts, and very generally elsewhere on those of Europe, wherever the shore is sandy. It is about 2 in. long, of a greenish-gray color, dotted with brown. It is in great esteem as an article of food, and is generally taken by nets in the form of a wide-mouthed bag, stretched by means of a short cross-beam at the end of a pole, and pushed along by the shrimper wading to the knees. Sometimes a net of larger size is dragged along by two boats. The supply of the market with shrimps affords employment to a great number of people.—The other species of shrimp seem to be equally fit for the table. Several are occasionally taken on the British coasts, but belong rather to more southern climates. See illus., **CRUSTACEANS, ETC.**, vol. IV.

SHROPSHIRE, or **SALOP**, a frontier county in the w. of England, bounded on the w. by north Wales, and on the e. by the counties of Stafford and Worcester. Area, 1343 sq. m.; pop. '91, 236,339. The Severn, the principal river, enters the county from Montgomeryshire, about 12 m. w. of Shrewsbury. It pursues a generally s.e. course of 70 m. across the county, is navigable throughout, and is joined by two considerable tributaries, the Tern and Teme. To the n. and n.e. of the Severn, the county is generally level, and is under tillage; to the s. and s.e., it is hilly and mountainous in the Cleve hills, rising to an altitude of 1800 ft., and here cattle-breeding is extensively carried on. A breed of horned sheep is peculiar to this county. The soil is generally fertile and well cultivated, though there are still extensive tracts of waste land. Shropshire is remarkable for its mineral wealth. The coal, iron, copper, and lead fields of Coalbrookdale, Snedshill, Ketly, etc., are very productive. Several thousand persons are employed in raising coal, iron, stone, and lime, and in the iron manufacture. The county returns four members to the house of commons. Capital, Shrewsbury.

SHROUDS are very strong ropes passing from the heads of the lower masts in a ship to the chains or channels on her sides, for the purpose of affording lateral support. They are crossed by thinner ropes, called ratlines, to form steps or ladders. The top-mast shrouds in ship rigged vessels are similar, except that they terminate in a row of dead-eyes on the outside of the tops.

SHROVETIDE (Anglo-Saxon *scrifan*, to shrive, to confess), literally means "confession-time," and is the name given to the days immediately preceding Ash-Wednesday, which, as indeed the whole period after Septuagesima Sunday appears to have been, were anciently days of preparation for the penitential time of Lent; the chief part of which preparation consisted in receiving the sacrament of penance, i.e., in "being shriven," or confessing. In the modern discipline of the Roman Catholic church a trace of this is still preserved, as, in many countries, the time of the confession, which precedes the paschal or Easter communion, commences from Shrovetide. These days were sometimes called fasting-tide or fast-mass, names which are still retained among the population in some parts of Great Britain. The name of Shrovetide was retained in England after the reformation, although the practice of "shriving," in which it had its origin, was abandoned. The precept of "shriving" having been fulfilled, the faithful, upon the eve of entering upon the Lent, were indulged with permission to give themselves up to amusements, and to festive celebrations, of which the counterpart is still seen in the continental carnival. In England the pastimes of foot-ball, cock-fighting, bull-baiting, etc., were, down to a late period, recognized usages of Shrovetide; and the festive banquets of the day are still represented by the pancakes and fritters from which Pancake Tuesday took its name, and by the "collops" which gave its title to Collop Monday. These usages are gradually disappearing.

SHRUB (see **SYRUP**), a kind of liqueur made chiefly in the West Indies. It consists of lime or lemon-juice and syrup, to which a small portion of rum is added; other flavoring materials are used occasionally.

SHRUBS are plants with woody stem and branches like trees, but of smaller size, not generally exceeding 20 ft. in height, and branching near the root, so as to have no main stem of considerable height. When a shrub is of small size and much branched, it is often called a *bush*. There is no more important botanical distinction between trees and shrubs, and the same genus very often includes species of both kinds. Many shrubs, as honeysuckle, are climbers.

In point of law, whoever plants a shrub thereby makes it a part of the soil, and it becomes a kind of fixture, incapable of being removed by tenants. But if the tenant is a nurseryman, who makes a business of planting and removing shrubs, it is otherwise.

SHUBRICK, WILLIAM BRANFORD, 1790-1874; b. S. C.; studied at Harvard, but left to enter the navy, 1806. He served in the war of 1812, on the *Hornet*, on the frigate *Constellation*, and on the *Constitution*, of which he became second in command in 1815. He was promoted commander in 1820, and capt. in 1831; was in command at the Norfolk, Va., navy-yard, 1840-43, and was appointed chief of the bureau of provisions in 1844. He commanded the Pacific squadron during the Mexican war, was made chairman of the bureau of construction in 1853, and commanded the Brazil squadron in 1858. Returning in 1859, he again became chairman of the light-house board, to which he had been appointed in 1852. He was made senior member of the advisory board, and rear-admiral in 1862.

SHUFELDT, ROBERT W., b. N. Y., 1822; entered the navy as midshipman, 1839. At the beginning of the civil war, he was a 1st lieutenant, but was then consul-gen. to Cuba; in 1862 he was made commander. He was prominent in the defenses of Charleston and had command of several ships. After the close of the war he was with the East Indian fleet, 1865-66; with that of the Mediterranean, 1871-73; in 1875 was made chief of the bureau of equipment and recruiting; rear admiral, 1883; retired 1884.

SHUGSHUT, a small t. of Turkey in Asia, in Anatolia, on the left bank of the Sakaria, 95 m. in direct line s.e. of Constantinople. On an adjacent hill is the tomb of Othman (q.v.), founder of the Ottoman dynasty. The tomb, resembling the handsomest and most ancient of the Turkish sepulchers at Constantinople, stands amid a grove of cypresses and evergreen oaks. Pop. estimated at about 8,000.

SHUMALA'RI or **CHUMALARI**. See **HIMÂLAYA**.

SHUMLA, a city of Bulgaria, about half-way along the line of railway which connects Rustchuk and Varna, and 50 m. w. of Varna. It is bounded on the n. and w. by mountains, and on the s. and e. by an undulating plain furrowed by valleys that extend n. to the Danube. Its situation is pleasing, and the character and distribution of its buildings give it a picturesque appearance. The roads from the former Turkish fortresses on the lower Danube and in the Dobrudscha on the n., and from the passes of the eastern Balkan on the s., converge upon Shumla, and from this reason it is an important strategic position. Under the Turkish sway, Shumla was one of their most important strongholds, with very strong and extensive fortifications, and possessed a citadel, arsenal, capacious magazines, large and numerous barracks, and a military hospital. The plain around was also studded with detached forts. In Shumla are nearly 40 mosques. Wine and silk are largely produced; there are manufactures of copper, cloth, and leather. The inhabitants during the Turkish supremacy were estimated at about 20,000, and were for the most part Turks or Mohammedans. Shumla was attacked in vain by the Russians in 1774, in 1810, and in 1828. The congress of Berlin, which established Bulgaria as an autonomous principality in 1878, resolved that the fortifications of Shumla and other Bulgarian towns should be destroyed. Pop. '93, 23,517.

SHUNT, a wire arranged to carry off a definite portion of an electric current—a by-path around an instrument. They are very much used in electrical engineering to protect a piece of apparatus from injury by being overcharged, to permit its removal for repairs, or to regulate the amount of current which passes through it.

SHUNT SYSTEM OF RIFLING is a very ingenious arrangement for securing the accurate centering of a projectile discharged from a rifled cannon. To obtain precision of aim and range, it is absolutely essential that the axis of a projectile should, at the moment of discharge, coincide exactly with the axis of the bore. This can scarcely be obtained unless the shot fits with extreme tightness into the gun; and if it does so, and the gun is a muzzle-loader, it is scarcely possible to load it. The ordinary principle has the projectile smaller than the bore, so as to pass readily into the gun, resting, of course, on the bottom of the bore. The projectile is covered with a soft metal, as lead, which expands with the pressure behind, and fits the shot tight into the grooves; but from the fact that it rested (at the commencement of the expansion) on the bottom of the bore, the axis of the shot is always below the axis of the bore. To obviate this, sir William Armstrong designed the "shunt" system, which in practice has been found admirably effective. In rifling the gun, the groove for 14 in. from the muzzle consists of a wide, deep indentation (*b* in figure), and at the side of it a narrow indentation of less depth, *a*; from 14 in. to 22 in. from the muzzle, this narrow groove gradually deepens, till it

attains the level of the broad groove, after which they run together for a short distance, until a shunt at *c* narrows the whole groove on the same side as *a* to the original width of *b*. Projecting from the shell is an iron flange too high to pass the narrow groove, and still higher by its side, a narrow band of zinc or of brass studs. Each of these passes freely along the broad deep groove of the bore. As the shot is rammed home, the twist of the rifling brings the iron flange against the edge *d* of the broad deep groove, which enables both the flange and zinc band to pass freely until past *f*, where the inclined plane ends. At *c*, however, where the groove becomes narrowed to only the width of the flange and band together, the shot is shunted over to the left. In this position it is rammed home. In coming out, of course, the pressure of the twist is reversed, and the zinc band presses against the straight edge *e*; on reaching *f*, the force of the exploded powder behind drives the shot on, while the inclined groove from *f* to *g* flattens down the zinc band, so that the projectile ceases to lie on the bottom of the bore, and is firmly centered by its several bands on the shallow grooves (whatever their number may be) round the bore's circumference. The lead fitting at the back of the shot has been meanwhile driven by the explosion into the deep wide grooves, so as to stop windage.

The Russians have a shunt system borrowed from sir W. Armstrong's, but differing in details. American guns, on similar principles, have been made experimentally. The invention does not appear to have been yet applied to small arms.

As the shunt system is complicated, it has been superseded by the Woolwich. See RIFLED ARMS.

SHURTLEFF, NATHANIEL BRADSTREET, 1810-74; born Boston, Mass.; son of Dr. Benjamin; graduate of Harvard university, 1831; of the medical school, 1834; commenced practice at Boston; mayor of Boston, 1868-70. He was learned in the sciences, an accurate genealogist, and a close and careful student of history. Notwithstanding that he claimed descent from 11 of the pilgrims of Plymouth, he was a devoted Roman Catholic. He was a contributor to the *Genealogical Register*, and edited the *Records of the Governor and Company of Massachusetts bay*, 1628-86, 6 vols.; and, with David Pulsifer, a publication from the MSS. of Nathaniel Morton, called the *Records of the Colony of New Plymouth*, 12 vols. He was author of several historical works.

SHUSHA, or SCHUSCHA, a fortified t. of Russian Transcaucasia, in the government of Elizabetpol, and 70 m. s.s.e. of Elizabetpol. It has manufactures of silk and cotton and there is some horse breeding. Pop. '91, 26,806.

SHUSTER, a city of Persia, in Khuzistan, on the Karun, 30 m. e.s.e. of Dizful, at the foot of a range of sandstone hills. In the early part of the present century, it was an important town and the capital of the province; but it was nearly depopulated by an epidemic in 1832, and was much damaged by an inundation in 1840. On a height stands the castle, commanded however, by a loftier elevation. The walls have been allowed to fall, and a fourth part of the town is in ruins. Customs are collected here, but the trade is not extensive. Pop. about 15,000.

SHUSHWAPS. See KOOTENAI.

SHUTE, SAMUEL, 1653-1742; b. London; educated at Leyden. He served under Marlborough in Flanders, and was governor of Massachusetts, 1716-23. During his term he had a dispute with the legislature, who refused to fix his salary and denied his right to negative the speaker.

SHUTTLE, the instrument used to carry the weft-thread in weaving. The original method of throwing the shuttle by the hand is still in use among weavers. The fly-shuttle, invented as early as 1733, is pointed at the ends with steel. The weft-bobbin is inserted in the center; and the necessary tension of the thread, is caused by two wire springs attached to this bobbin. The shuttle is made to allow the weft-bobbin to pass out at its side. The fly-shuttle is straight and is usually made of box-wood. The hand-thrown shuttles are occasionally carved, for convenience. See LOOM.

SIALOGOGUES are substances which, by local stimulating action, increase the secretion of saliva. Among the substances which thus act as direct stimulants to the salivary glands (q.v.), we may especially mention horse-radish root, mezereon bark, and pellitory root. Horse-radish root when chewed, produces a copious flow of saliva, and has been found useful in aiding deglutition in cases of paralysis of the tongue. If mezereon bark is used in the same way, the saliva should be frequently ejected, in consequence of the acrid properties which it absorbs from the drug. Pellitory root is the best of this class of remedies. Fragments weighing from half a dram to a dram may be frequently chewed when we wish to increase the flow of saliva in cases of facial neuralgia, rheumatism of the muscles of mastication, and paralysis of the tongue.

SIAM' (native name *Thái* = the free, or *Muang Thái* = the kingdom of the free), the chief state of Indo-China, is bounded on the s. by the gulf of Siam and the Malay peninsula. On the w., n., and e., the frontier-line is ill-defined and fluctuating, owing to many tribes being only partially under subjection, and to the constant wars of aggrandizement between Siam and the Malayan and Burmese races on the w., and the Cambodian and Cochinchinese races on the east. According to a recent account, the country lies in lat. 4° to 21° n., long. 98° to 106° e.; is 1200 m. in length, and about 350 m. in extreme breadth. Area estimated at 300,000 sq. m., including 60,000 sq. m. in the Malay peninsula; population estimated at 8,000,000. But the French have acquired a large part of the territory included in this estimate. Great Britain had transferred a considerable territory on Upper Mekong to China, but, in 1895, the Chinese government gave the French the right to this region, and, in 1896, the British government recognized the French claim, but entered into an arrangement with France guaranteeing to Siam the integrity of the lands in the basins of the Menam, Mekong, Bangpakong, and Pechaburi rivers, together with certain other districts. The territory taken by the French between the years 1893 and 1896, covers about 100,000 sq. miles, leaving to Siam only about 200,000. The population of these reduced limits of Siam is estimated at 5,000,000. The capital, and the only city of great importance to foreigners, is Bangkok (q. v.). The kingdom consists of 41 provinces, each governed by a phraya, or functionary of the highest rank.

Surface, Hydrography, Coast-line, Soil, and Climate.—The mountains which cover the northern districts of the country, and form natural barriers along its e. and w. frontiers, are branches of the great system of the Himalaya. Though the northern dependencies of Siam are mountainous, the kingdom proper is a vast plain, which only becomes hilly on its northern frontier. The great river of the country, the Nile of Siam, is called by foreigners Menam, or more commonly Meinam; but the Siamese call all rivers by this name, and distinguish the river by adding to the name Menam the name of the chief town or village on its banks; thus Menam Bangkok is the river of Bangkok, that is, the great river of the country, which Europeans and other foreigners have agreed to call Meinam. This river, the great life-sustaining artery of the country, rises among the mountains of the Chinese province of Yunnan, whence it flows s., and after a course of more than 800 m. in this direction, throws itself by three mouths, which are from 6 to 8 fathoms deep, into the gulf of Siam, about 30 m. (18 m. in direct line) below Bangkok. It receives a number of important affluents, notably the river Phitsalok, which joins it in lat. about $17^{\circ} 35'$ n. The annual inundation of the Meinam, the occasional non-occurrence of which entails failure on a great portion of the rice crops, commences in June and ends in November. Impregnated with the rich soil which it brings from the interior, its waters in August overflow the banks to a height sometime exceeding 6 ft. above the ordinary level. The tract of country within the direct influence of the inundations is estimated at 12,000 sq. m.; but, properly speaking, the actual valley of the Meinam, commencing 450 m. above the mouth of that river, and with an average breadth of 50 m., has an area of upward of 22,000 sq. m., and forms a tract of country the fertility of which is not exceeded in any other quarter of the globe. Of the other great rivers, the chief is the Mei-kong, which flows through the eastern districts of the empire, and is said to be 1600 m. long. The coast-line fringing the edge of the gulf of Siam may be roughly estimated at 1100 m., exclusive of minor windings. The breadth of the Malayan peninsula, in lat. 11° n., is only 50 m., and here two streams, the one flowing w. to the bay of Bengal, and the other e. to the gulf of Siam, offer great facilities for the construction of a ship-canal, for, their sources being near each other, a few miles of canalization are all that would be required to connect them, and thus form a sea-way across the peninsula, which would shorten the voyage between India and eastern Asia by many days, and often by weeks.—The climate of Siam is, for a tropical region, salubrious; the resident missionaries speak highly in its favor. The mean temperature at Bangkok for a series of eight years was 81.14° ; the maximum heat within the same space was 97° , and the minimum 54° . The warmest month was April and the coldest December. Hurricanes and typhoons are almost unknown in Siam, though it is visited every year by the s.w. and n.e. monsoons—the former bringing clouds, thunder-storms, and rain, the latter bringing refreshing weather.

Agriculture, Flora, and Fauna.—Rice and sugar are the principal crops. Of the other products, the chief are *agula*, or eagle-wood, renowned for its perfume, and extensively used on that account at funerals, marriages, and other ceremonies in Eastern Asia; gutta-percha, cardamoms, gamboge, bamboo, the rattan, valuable palms, the guava, mango; daurien, esteemed the king of fruits in Siam; the mangosteen, and many other fruits and other trees, including teak and a variety of valuable ship and house timbers. Among the animals, the most famous is the elephant, which abounds in the forests. It is against the law of Siam to kill elephants, as these animals are considered the property of the king; but many of them are nevertheless slain for the sake of their tusks. A variety of this animal, said to be peculiar to Siam, is the white elephant, which is not really white, but of a light mahogany color. This animal is held in the highest veneration, the cause of which is that he is "supposed to be the incarnation of some future Buddha, and will therefore bring blessings on the country which possesses so great a treasure."

He is fed upon fresh grass, and sugar-canes and plantains, served in rich dishes, is covered with ornaments, inhabits a building attached to the palace, enjoys the rank of nobility, and is tended by a staff of officers, guards, valets, etc. Tigers abound, especially in the Laos country in the n.; tiger-cats, rhinoceroses, boars, wild pigs, elks, and deer of many kinds, tenant the woods. Crocodiles, lizards, and serpents of various kinds are numerous. Excellent fish are found on the coasts and in the rivers. Great improvements have been made in Siam in recent years by extending the system of irrigating canals. Siam is eminently a country of water-ways and the great rivers are connected by numerous canals, which fulfil the double office of irrigating the land and affording means of communication.

Minerals.—Gold is found among the mountains, and silver in combination with other metals; copper, tin, lead, and iron are abundant, and are extensively worked by the Chinese. Precious stones are found in great number and variety.

Manufactures.—Vases, urns, and other vessels, in the manufacture of which gold is embossed upon silver, are made here in great numbers, and have an oriental celebrity. Gold-beating, iron-founding, and manufactures of fine cloth, glass wares, and pottery are carried on.

Commerce, Exports, and Imports.—The trade is in the hands of the foreigners, the British having the greatest share. The center of foreign commerce is Bangkok, which is a cosmopolitan city containing large numbers of Europeans and foreign Asiatics. Next to the British, the Germans enjoy the largest share of the Siamese trade, and there are some Danish, Dutch, Italian, and French houses in Bangkok. Of the Asiatics, the Chinese are the most active in commerce in Siam. The natives are unenterprising and leave to the foreigners, especially to the Chinese, a large share even of the petty retail trades. The means of living are easily secured and hard work seems unnecessary. The Siamese treat foreigners with respect, and afford no obstacles either to travel in the interior or to trade. The duties on foreign merchandise are low, not exceeding an average of 3%. Bangkok is connected by regular steamship lines with Hong Kong and Singapore, and in passing from the Pacific coast of the United States to Siam but one change is required, at Hong Kong. The country is a member of the International Postal Union. There are large banking agencies in Bangkok, with representatives in the leading European and American cities. The chief article of export is rice, which made up 66% of the total in 1894. Most of it found a market in Hong Kong and Singapore. Next in importance is teak-wood, purchased for shipbuilding and largely consumed in Great Britain. Other exports are various kinds of gums, seeds, animal products and minerals. Of the imports, the most important class of articles is textile fabrics, but there is a considerable importation of food products, including sugar, wines, liquors, tea, molasses, and flour. Kerosene oil, hardware, crockery, jewelry and paper have also been important articles of import. As to the condition of labor, the natives are liable to forced labor during a certain portion of each year. Domestic slavery was formerly general, but has gradually been abolished. Slavery for debt is still practiced. There is a dearth of free labor, and dependence is placed in some parts of the country chiefly on the Chinese coolies, and in others on the Burmese, Karens and Khamus. A railway connecting Bangkok with the seaport Paknam was opened in 1893 and a survey for a line from the former city to the northern and eastern provinces was begun in 1888. In 1896 a railway from Bangkok to Korat, a distance of 165 miles, was in process of construction. The mileage of telegraph lines has also increased in recent years.

Inhabitants and Government.—The Siamese proper, that is, the Thai race, form about a third of the entire population. "They are gentle, timid, careless, and almost passionless." They differ in several respects from many eastern nations. Lying, though frequently resorted to as a protection against injustice and oppression, is not a national characteristic. The Siamese are inclined to be idle, inconstant, and exacting; but they are sincere, very affectionate in their domestic relations, witty in conversation, and, like the Chinese, expert in mimicry. The population of the entire region comprised within Siam before the French annexation was estimated to contain 2,500,000 Siamese, 2,000,000 Laotians, 1,000,000 Chinese, 1,000,000 Malays, and about 1,500,000 Burmese, Indians and Cambodians, but the estimates of the population are unreliable. Their diversity is illustrated by the reports in regard to Bangkok, whose population, according to estimates, ranges anywhere from 200,000 to 1,000,000. The Laos people (see SHAN STATES) are also very numerous in the country, and there are considerable numbers of Malays and Cambodians. The religion of the Siamese is Buddhism (q.v.), which inculcates the highest veneration for life in whatever form. A Siamese will not kill vermin or serpents; and the tameness of many creatures that in Europe flee from the presence of man is observed by all strangers. The use of betel (q.v.) is almost universal in Siam. All the belles of Siam stain their teeth black. The Siamese are extremely ceremonious in their intercourse one with another. An inferior crouches and crawls on the ground before a dignitary, and speaks of himself as "your slave—a hair—a little beast." They are a small well-proportioned race, with olive-colored skin, and black hair, of which all that they allow to grow is a tuft about two inches long on the top of the head, the rest being shaven off. They are remarkably fond of jewelry and ornaments, and the dresses of the higher functionaries and nobles are splendid and beautiful. They are fond of music; have a number of good native instruments, as well as the common European ones, and are skillful performers.

The government is an absolute and hereditary monarchy, although the hereditary principle is not necessarily observed, each king having the right of nominating his successor. There is a cabinet consisting of departments of foreign affairs, interior, justice, finance, public instruction, public works, war, marine, etc. By royal decree in 1895 a legislative council was created, whose object is to revise and perfect the legislation of the kingdom. In case of any temporary disability on the part of the crown, the legislative council has power to promulgate laws. In the same year the administration of the country was consolidated under a single head, Prince Damrong, minister of the interior, having it in charge. The portfolios are held by the king's half-brothers.

History.—The annals of the Siamese begin about five centuries B.C. But nothing authentic is known of the history of the country till 1350, in which year Ayuthia, the former capital, was founded. Cambodia was first conquered in 1532, and in this century the Siamese dominion extended to Singapore. The present dynasty ascended the throne in 1782. There have been Protestant and Roman Catholic missionaries in the country since 1828, and they are usually regarded with favor by the natives. King Khulalongkorn I., born in 1853, succeeded to the throne in 1868. He has been a progressive ruler, and during his time many material improvements have been effected. In 1897 he made an extended tour in Europe. See Maxwell Sommerville, *Siam* (1897).

SIAM, GULF OF, an important arm of the Pacific ocean, is bounded on the n. and w. by Siam, on the s.w. by the Malay peninsula, and on the n.e. by Cambodia. At its entrance between Cambodia point and the peninsula of Patani on the Malay peninsula, it is 235 m. wide, and from the line drawn between these two points it extends inland in a n.w. direction to the mouth of the Meinam, a distance of 470 miles. Four great rivers, navigable to a considerable distance from their mouths, and the chief of which is the Meinam (see SIAM), fall into the gulf. It is unvisited by hurricanes of any kind, and shipwrecks here are very rare.

SIAMESE TWINS, a name given to two youths, Eng and Chang, born of Chinese parents in Siam, in 1811, having their bodies united by a band of flesh, stretching from the end of one breast-bone to the same place in the opposite twin. The survival to advanced life of such a *lusus nature* makes this one of the most remarkable cases on record. A union of the bodies of twins by various parts is not an unusual occurrence (see MONSTROSITY). Ambrose Paré has depicted instances of union by the back, belly, and forehead. The last occurred in two girls, who lived to the age of ten years, when one of them dying, a separation was made; the wound of the living girl assumed a bad character, and soon proved fatal. The Hungarian sisters, who lived about a century since, were united by the back, had one passage from the intestines, and each had one from the urinary organs. They died when they were 22 years of age. The Siamese twins were purchased of their mother at Meklong, a city of Siam, and were brought to America by Capt. Coffin and Mr. Hunter in 1829. On examination, the connecting band seemed to have united them at first face to face, but constant traction had so changed its direction, that they stood partially side by side. Its length above was about two in.; below, nearly four; from above downward, it measured three in.; and its greatest thickness was one and a half inches. It was covered with skin, and when the center was touched, both felt it; but on touching either side of the median line, only the nearest individual was sensible of it. The connection between the Siamese twins presented many interesting points in regard to physiology and pathology, for although they formed two perfectly distinct beings, they appeared most frequently to think, act, and move as one individual.

After realizing a competence by the exhibition of themselves in the various countries of Europe, the Siamese twins settled in one of the southern states of America, where they were married to two sisters, and had offspring. Owing to domestic quarrels, however, two houses were found necessary, each living with his wife a week at a time alternately. Ruined by the civil war in America, the Siamese twins again made the tour of Europe and exhibited themselves to the public. They died in 1874, the one surviving the other an hour or two only.

For a full account of the structural peculiarities of such cases, see St. Hilaire's *Histoire des Anomalies de l'Organisation d'Homme et des Animaux*.

SIARA, properly, Ceara (q.v.).

SIBBALD, Sir ROBERT, an eminent Scottish naturalist, b. at Edinburgh, April 15, 1641, of a good family (the Sibbalds of Balgonie, in Fife), studied at the high-school and university of Edinburgh, and afterward pursued his medical studies at Leyden, Paris, and Angers; settled as a physician in Edinburgh in 1662, devoted much time to botany and zoology, and aided sir Andrew Balfour in establishing a botanic garden in Edinburgh. Having inherited an estate, he retired from medical practice, but continued his scientific pursuits; was appointed by Charles II. his majesty's geographer for Scotland, and was encouraged to prepare a work on the geography and natural history of his native country. His death is supposed to have taken place in 1712. He published many pamphlets on medical subjects, natural history, Scottish history, antiquities, etc. The work for which he is now chiefly remembered is his *Scotia Illustrata, sive Prodrromus Historiæ Naturalis*, etc. (fol. Edin. 1684), a work of great merit for its time, but his *Collection of Several Treatises in Folio Concerning Scotland, as It was of Old, and also in Later Times* (Edin. 1739), is not without value.

SIBERIA, a vast territory in northern Asia, belonging to Russia. In England the name is generally applied to all the Russian possessions in Asia, with the exception of the Transcaucasian and Armenian provinces. Siberia so defined is bounded on the n. by the Arctic ocean; on the e. by the seas of Kamchatka, Okhotsk, and Japan, all of them arms of the Pacific ocean; on the w. by the Ural mountains, Ural river, and Caspian sea. The southern boundary is made to include the recent Russian acquisitions in Turkestan, runs from lake Issyk Kul, n.n.e., then eastward by Kiahta to the Argun river, which it follows to the Amur; the latter it follows to long. 135° e., where it trends in a s.s.w. direction, ascending the Ussuri tributary for 200 m., and then runs straight to the sea at the northern frontier of Corea. In the official language of Russia, however, Siberia is not of so wide extent. The Russian possessions in Turkestan form a separate division under the name of CENTRAL ASIA, and to this portion of the empire the governments of Akmollinsk, Semipalatinsk, Turgai, and Uralsk are now attached. Geographically speaking, these governments belong to Siberia; as do also considerable areas e. of the Ural mountains, which for administrative purposes, form part of the European governments of Perm and Orenburg. The following article deals mainly with the region officially termed Siberia; for the Russian possessions in the Turkestan territory, see ASIA, CENTRAL. The following are the subdivisions or governments of Siberia:

	DIVISIONS AND PROVINCES.	
	Surface in Eng. Sq. Miles.	Population 1892-94.
Yakutsk.....	1,533,397	245,368
Transbaikalia.....	236,868	611,686
Irkutsk.....	287,061	460,275
Yeneseisk.....	987,186	480,546
Tomsk.....	331,159	1,422,681
Tobolsk.....	539,659	1,411,475
Amur Region.....	888,830	242,004
Sakhalin.....	29,336	26,590
Total.....	4,833,496	4,874,335

According to the enumeration of 1897 (see RUSSIA) the population of the whole of Asiatic Russia, including the trans-Ural districts of Perm and Orenburg was 15,300,000. In Siberia there is about one inhabitant to a square mile. The northern and eastern shores are very irregular in form, jutting out frequently into bold peninsulas and promontories and being indented with numerous immense inlets, chief of which are the estuaries of the Obi (575 m. in length) and of the Yenesei; the gulf of Anadir, and the sea of Okhotsk. All the island groups to the n. of Siberia, and since 1875 the whole of Sakhalin or Saghalien on the e. coast, belong to Siberia; whereas, since 1875, all the Kurile islands are Japanese. The Liakhoff group, near the mouth of the Lena, consists of three islands from 60 to 100 m. long by 20 to 40 broad, and of numberless islets: they are completely barren, and present in their soil and subsoil alternate layers of sand and ice, in which are imbedded the fossil remains of numerous animals. The greatest length of Siberia is 5,600 m. from n.e. to s.w., and the greatest breadth 2,170 m. from n. to south. A country of such vast extent (greatly larger than Europe) must necessarily exhibit great varieties of climate; and we accordingly find in the northern regions, much of which lie far within the Arctic circle (cape Chelyuskin, which is the most northerly promontory of Siberia, and of the old world, being in lat. 78° 25' n.), an extensive tract bordering on the ocean, composed of swamp, moorland, and mossy flats, covered with snow and ice for one-half of the year, and even during the greatest heats of summer, released from its icy bonds only to the depth of a few inches below the surface of the soil. The ocean, its northern boundary, is frozen for miles seaward during more than half the year, and during the remaining months, the numberless icebergs and flocs which crowd the sea, and continually come into collision, render the navigation so dangerous that no complete hydrographic survey of the coast has yet been made. On the southern boundary of this semi-barren zone, stunted misshapen bushes and trees are found; and as we advance southward, vegetation appears in the form of extensive forests of birch, fir, and larch, which clothe the plains and hill-sides, and are interspersed with stretches of pasture of moderate quality. After crossing the parallel of lat. 64° n. in west Siberia, and that of lat. 61° n. in east Siberia, the more hardy cereals, barley, oats, and rye, begin to appear, and the soil increases in fertility, sometimes to an extraordinary extent, thick woods of Siberia cedar and other trees clothe the mountain sides, and the valleys, especially along the banks of rivers, are in a state of continuous cultivation. The whole of western Siberia is one great plain, sloping from its southern boundary, where the average elevation is 2,000 ft., northward to the Arctic ocean; with the exception of the small corner in the s.w., which is drained into the Caspian and Aral seas. The fertility of a great portion of the governments of Tobolsk and Tomsk, especially of the *Baraba* and *Ishim* steppes, is proverbial, and they are the great granaries of Russia and northern Europe. But the warmest and perhaps most fertile part of western Siberia is the valley of the Yenesei, n. of the Sayansk mountains. Eastern Siberia is more hilly and less fertile than the western portion, but the valleys and hill-sides afford good pasture. Four-fifths of Siberia is drained by the three immense rivers Obi, Yenesei (q.v.), and Lena (q.v.), and by a number of smaller rivers, all of which flow to the Arctic ocean. Siberia has a large number of lakes, some of which are little else than

LIBRARY
UNIVERSITY OF ILLINOIS
URBANA

salt marshes; the largest of them are lake Baikal (q.v.) and lake Balkash (q.v.). The chief mountain range of Siberia is the Altai chain, which forms the southern boundary toward Mongolia, and ramifies eastward and northward from the region of lake Baikal, covering a large portion of the surface of eastern Siberia. The Stanovoi hills stretch from the Amur n.e. along the shores of the sea of Okhotsk. The Yablonnoi mountains, which long found a place in books of geography, were shown by the Russian exploring commission (1863) to have no existence, the place where they were supposed to be situated being an undulating plateau, which connects the basin of the Indigirka and the sea of Okhotsk. Lofty mountain-chains traverse the island of Saghalien and the peninsula of Kamtchatka, in which there are 21 active volcanoes, the loftiest of which is Kliutshewsker; elevation 15,000 feet. Among the wild animals of Siberia are the reindeer in the northern flats, and on the high mountains of the s.; the arctic or black fox, and white bear in the n.; the sable, ermine, marmot, marten, squirrel, Caspian antelope, and wild sheep—all in the s.; and the lynx, wolf, wild-boar, and glutton are generally diffused. Camels are found among the Kirghiz, along with the broad-tailed sheep, the Russian sheep being also domesticated in Siberia; and horses of good quality, an inferior sort of cattle of the Russian breed, and a large wolfish-looking dog, used chiefly to draw sledges, complete the list of domestic animals. Fresh and salt water fish abound, and feathered game is plentiful in the south. The mineral wealth of Siberia is great: gold, silver, copper, and lead are found in all the mountainous districts on the w. and s.; platinum, iron, and precious stones, including diamonds, are found on the eastern slopes of the Ural; zinc, antimony, arsenic, plumbago, and valuable emerald and topaz mines are worked in the districts n. of the Amur; and porphyry, malachite, jasper, and salt (from the steppes) are common. More than half of the inhabitants of the central and western provinces are Russians and Poles, or of Russian and Polish descent, and these have been sent to the country either as exiles, on account of political or criminal offenses, or as government colonies. The most abandoned class of exiles are kept to hard labor in the mines; others are put to less laborious, but still compulsory work; and a third portion are settled in specified districts, under surveillance of the police, and allowed to employ themselves as they choose. This last class chiefly employs itself in trapping those animals whose skins and furs form valuable articles of trade. In the north-west are found the Samoieds, and adjoining them the Ostiaks, both of whom live by hunting and fishing alone. In the s. are the nomad tribes of the Kirghis (q.v.) and Kalmuks (q.v.), both cattle-breeding peoples, though the latter have now partially adopted a settled mode of life, and manufacture iron and gunpowder. Next to them, on the borders of Manchooria, are the Buriats, a people of Mongol origin, and the most numerous tribe in Siberia; to the n. of whom are the Yakuts and Tunguses, of Tartar origin, who are spread over the whole of eastern Siberia, from the town of Irkutsk to the Stanovoi range, and live mostly by hunting. The Tchuktchis, an Esquimaux race, and the Koriaks inhabit the n.e. corner, and the Manchus are the population of the Amoor territory. Manufactures are unimportant, and are confined to the principal towns; the barter trade in European goods is carried on at Obdorsk, Ostrovnoe, Yakutsk, and Petropavlovsk; and the transit-trade with China through Kiahta (q.v.), the imports from China being tea of the finest quality, sugar, silk, cotton, wool, grain, fruits, etc.; and the exports to that country, cotton and woollen cloths, linen, furs and skins, leather, and articles of gold and silver. The exports to Russia are the natural produce of the country, and are transported westward to the frontier by alternate land and river carriage, to Tobolsk, thence over the Ural mountains to Perm. Reindeer sledges are the usual means of transport in winter. Fairs are held at stated periods in certain localities, and much of the trade of the country is there transacted. The chief towns in Siberia proper are Tobolsk, pop. 20,175; Tjumen, 13,000; Tomsk, 36,742; Irkutsk, 43,962. Siberia seems to have been first made known to the Russians by a merchant named Anika Stroganoff; and soon after, the conquest of western Siberia was effected by the Cossack Vassili Yermak, an absconded criminal, at the head of a numerous band of wild followers. After Yermak's death in 1584, the Russians pursued their conquests eastward, founding Tomsk in 1604, and though they often experienced serious reverses, their progress was rapid, the sea of Okhotsk being reached in 1639, and Irkutsk founded in 1661. Frequent disturbances have occurred between the Russians and the Chinese and Tartars, which have resulted in the extension southward of the Siberian boundary into Manchooria and Turkistan (q.v.). In 1845 the left bank of the Amoor became Russian. In 1858 the frontier was extended along the sea-board s. of the river to the frontier of Corea. The Russians have now a large number of steam-vessels on the Amoor. Recent voyages of exploration point to the practicability of opening direct and extensive commerce between Archangel and the rivers Obi and Yenesei. The Lena is also navigable for a great distance from its mouth. See Atkinson's *Siberia*, Lansdell's *Through Siberia* (1882), Eden's *Frozen Asia* (1880), and Kennan's articles in the *Century Magazine* on the Siberian exile system. For an account of the Trans-Siberian railway, see RUSSIA.

SIBLEY, a co. in central Minnesota, bordered on the e. by Minnesota river; 588 sq. m.; pop. '90, 15,199. The surface is undulating, and is partly covered with forests. It contains lake Minnetonka, 30 m. in length, and other lakes of smaller size. The soil is fertile. Co. seat, Henderson.

SIBLEY, HENRY HASTINGS, b. Detroit, Mich., 1811; son of judge Solomon Sibley, lived for many years at Mackinaw and fort Snelling, employed by the American Fur co. He was delegate from the territory of Minnesota, 1849-53; first governor of the state, 1858; during the late war brig. gen. of vols. He took charge of an expedition against the Indians on the Minnesota frontier, 1863; brevetted maj. gen. of volunteers;

SIBLEY, HIRAM, b. Mass., 1807; in early life he was a manufacturer of machinery, but became interested in telegraph corporations, and by his exertions about twenty weak companies were united in one, the Western Union, thus establishing the business on a strong foundation. He was prominent in securing the building of the Pacific telegraph line, and was intending to carry a line to Europe by way of Behring strait had the Atlantic cable failed. Mr. Sibley contributed \$100,000 each to the universities of Cornell and Rochester. He d. 1888.

SIBLEY, JOHN LANGDON, b. Me., 1804; educated at Harvard college, of which he was librarian, 1825-26, 1841-56, and 1856-77. Mr. S. wrote a history of *Union, Maine*; *Notices of the Triennial Catalogues of Harvard University*, and *Harvard Graduates*. His rank among librarians was high. He d. 1885.

SIBYL (Gr. *sibulla*, according to the old derivation from *dios boule*; Doric, *sios bolla*—the “will or counsel of God”), the name anciently given to several prophetic women, whose history, in so far as they have any, has come down to us in a wholly mythical form, if, indeed, such beings ever existed at all. Their number is differently given; some writers (Ælian, for example) mention only four—the Erythræan, the Samian, the Egyptian, and the Sardinian; but in general ten are reckoned, viz., the Babylonian, the Libyan, the Delphian, the Cimmerian, the Erythræan, the Samian, the Cumæan, the Trojan or Hellespontian, the Phrygian, and the Tiburtine. Of these, by far the most celebrated is the Cumæan, identified by Aristotle with the Erythræan, and personally known by the names of Herophile, Demo, Phemonoë, Deiphobe, Demophile, and Amalthæa. She figures prominently in the 6th book of Virgil’s *Æneid*, as the conductor of the poet into the realm of the shades. The Roman legend concerning her (as recorded by Livy) is, that she came from the east, and appearing before king Tarquin the proud, offered him nine books for sale. The price demanded appeared to the monarch exorbitant, and he refused to purchase them. She then went away, destroyed three, and returning, asked as much for the remaining six as for the nine. This was again refused, whereupon she destroyed other three, and once more offered to sell him the rest, but without any abatement of the original price. Tarquin was struck by her pertinacity, and bought the books, which were found to contain advices regarding the religion and policy of the Romans. They were preserved in a subterranean chamber of the temple of Jupiter on the Capitoline, and were originally intrusted to two officials (*duumviri sacrorum*), appointed by the senate, who alone had the right to inspect them. The number of keepers was afterward increased to 10 (*decemviri*), and finally, by Sulla, to 15 (*quindecimviri*). In the year 84 B.C., the temple of Jupiter having been consumed by fire, the original sibylline books or leaves were destroyed, whereupon a special embassy was dispatched by the senate to all the cities of Greece, Italy, and Asia Minor, to collect such as were current in these regions. This being done, the new collection was deposited in the temple of Jupiter after it had been rebuilt. Spurious sibylline prophecies—or what were regarded as such—accumulated greatly in private hands toward the close of the republic; and Augustus, fearing, perhaps, that they might be turned to political uses, ordered them all to be given up to the city-prætor, and burned them. More than 2,000 were destroyed on this occasion. The remainder were kept in the temple of Apollo, on the Palatine, under lock and key; but the whole perished during the burning of Rome in the time of Nero. Other collections were made; and as late as the 6th c., when the city was besieged by the Goths, there were not wanting some who pretended to predict the issue from a consultation of these venerable oracles. It is, however, beyond doubt, that as early, at least, as the 2d c. A.D., when enthusiastic men sprang up in the Christian church, prophesying in a poetic-oracular style (whence they were sometimes called *sibyllists*), the sibylline books were much interpolated and falsified to assist the progress of the new faith. The utterances of these Christian sibyllists form a special department of early ecclesiastical literature, and are a mixture of Jewish, pagan, and Christian ingredients. The collections of them also bear the name of “sibylline books.” An edition was published by Gallæus, at Amsterdam, in 1689, and was entitled *Oracula Sibyllina*; fragments have also been edited by Angelo Mai (Milan, 1817) and Struve Königsberg, 1818).—Consult Bleek, *Ueber die Entstehung und Zusammensetzung der uns in acht Büchern erhaltenen Sammlung Sibyllinischer Orakel* (in Schleiermacher’s *Theologische Zeitschrift*, Berl. 1819) and Thorlacius, *Libri Sibyllistarum Veteris Ecclesiæ* (1822); Ewald, *Ueber Entstehung, Inhalt und Werth der Sibyllinischer Bücher* (Gött. 1858); and Volkman.

SICILIAN VESPERS, the name given to the massacre of the French in Sicily, on the day after Easter (March 30), 1283, the signal for the commencement of which was to be the first stroke of the vesper-bell. In the articles NAPLES, KONRADIN, MANFRED, etc., it is related how Charles of Anjou, the brother of Louis IX. of France, had deprived the Hohenstaufen dynasty of Naples and Sicily, and parceled out these kingdoms into domains for his French followers; but his cruelty toward the adherents of the dispossessed race, his tyranny, oppressive taxation, and the brutality of his followers, excited

among the vindictive Sicilians the deadliest animosity. The aged Giovanni da Procida, a steady partisan of the Hohenstaufen family, took the lead in directing and systematizing a conspiracy against Charles and his followers; and after a visit to Pedro of Aragon (the husband of Constance the cousin of Konradin, and the next heir to Naples and Sicily), whom he found willing to undertake the conquest of Sicily, he returned to his self-imposed duty in the island. On the evening of Easter-Monday the inhabitants of Palermo, enraged (according to the common story) at a gross outrage which was perpetrated by a French soldier on a young Sicilian bride, precipitated the accomplishment of the scheme by suddenly rising upon their oppressors, putting to the sword every man, woman, and child of them, not sparing even those Italians and Sicilians who had married Frenchmen. This example was followed, after a brief interval, by Messina and the other towns, and the massacre soon became general over the island: the French were hunted like wild beasts, and dragged even from the churches, where they vainly thought themselves secure. More than 8,000 of them were slain by the Palermitans alone. Only one instance of mercy shown to a Frenchman is on record, the fortunate subject being a Provençal gentleman, Guillaume des Porcellets, who was much esteemed for his probity and virtue. The governor of Messina also succeeded in passing the strait with his garrison before it was too late.—See Amari, *La Guerra del Vespro Siciliano* (Palermo, 1841; 6th ed. Flor. 1859), and Possien and Chantrel's *Les Vêpres Siciliennes* (Paris, 1843).

SICILIANA, in music, a name given to a slow, soothing, pastoral description of air, in $\frac{3}{4}$ time; so called because the dance peculiar to the peasantry of Sicily possesses this character.

SICILY, the largest, most fertile, and most populous island in the Mediterranean sea, lies between lat. $36^{\circ} 41'$ and $38^{\circ} 18'$ n., and between long. $12^{\circ} 30'$ and $15^{\circ} 40'$ e., and is separated from the main-land of Italy by the strait of Messina. Its shape roughly resembles a triangle (whence the early Greek navigators gave it the name of *Trinacria*, the "Three-cornered")—the eastern coast, from Capo del Faro in the n. to Capo Passaro in the s., forming the base; and the northern and south-western coasts the sides, which gradually approach each other toward the n.w. The length of the base is 145 m.; of the northern side 215 m.; and of the south-western 190 m.: the circumference of the island, including the sinuosities of the coast, is estimated at 624 miles. Area about 9936 sq. miles. Pop. according to an estimate of Dec. 31, 1895, 3,494,125. Capo Passaro, at the south-eastern extremity, is only 56 m. from Malta; and Capo Boco, near Marsala, at the north-western, only 80 m. from cape Bon on the African coast.

Physical Geography.—The island of Sicily, like the main-land of Italy, is traversed throughout its entire length by a chain of mountains, which may be looked upon as a continuation of the Apennines (q.v.). This chain, beginning at Capo del Faro on the strait of Messina, runs in a south-south-western direction as far as Taormina, where it turns off to the w., and stretches across the whole island, keeping, however, much nearer to the northern than to the south-western coast. The first part of the chain, from Capo del Faro to Taormina, is called the Peloric range (anc. *Neptunius Mons*), which in Monte Dinamare attains the height of 3,260 ft.; the second and much the longer part is called the Madonian range (anc. *Nebrodes Montes*), which, in the Pizzo di Case, rises to an elevation of 6478 feet. It forms the great watershed of the island. Toward the north-western coast the chain breaks up into irregular and often detached masses, such as Monte Pellegrino (1903 ft.) and Monte San Giuliano (2460 ft.). About the center of the chain a range branches off through the heart of the island to the s.e.; at first wild and rugged, but afterward smoothing down into table-lands, which in turn slope away tamely to the sea. There are innumerable other spurs to the s. from the great Madonian chain, of inferior length and elevation, but none of these require special mention. The volcano of Etna, which rises in solitary grandeur on the eastern coast, is separately described. See **ETNA**. Sicily is not, on the whole, a well-wooded country, but forests of considerable size are found here and there as, for example, the royal forests near Caronia and Mezzojuso, the forest-zone of Etna, etc. In the interior of the island there is not much level land, but on several parts of the coast there are extensive plains, generally of great fertility. The principal of these are the great plain of Catania (anc. *Campi Leontini*), out of which rises Etna; the plains of Palermo, termed the *Conca d'Orò*, or "Golden Shell," of Castellamare, of Licata, and Terranova.—Although rivers are numerous, none are navigable. The largest are the Simeto or Giarretta, the Cantara, the Salso, the Platani, and the Belici.

Climate.—The climate of Sicily is very warm, but salubrious, except in low-lying places where there is a mephitic atmosphere. The best health is enjoyed in the lower regions of Etna, which is very densely peopled, although exposed to eruptions and violent earthquakes. The heat is intense in summer when the sirocco blows. After the autumnal equinox violent winds are prevalent, torrents of rain fall, and all along the coasts the atmosphere is charged with moisture and fogs. The earthquakes begin about the end of winter, and do great damage. Snow and ice are rarely to be seen except on Etna, and the highest points of the other mountains.

Geology and Mineralogy.—The primary rocks in the mountainous districts are chiefly quartz, granite, and mica. In some parts these are overlaid by limestone rocks. Most

of the lower ranges of hills are of calcareous formation, and are rich in metallic ores. Sulphur forms the chief mineral wealth of Sicily. Immense beds of it are found in the central and northern parts of the island. In 1895, 347,113 tons of sulphur were exported, and the mines are worked by Cornish miners and their descendants; other minerals found are rock salt, copper, silver, lead, antimony, marbles, jaspers and agates.

Soil, Agriculture, etc.—The soil of the island is so fertile that very little labor is required to raise the crops. In many valleys there is rich soil to the depth even of 40 feet. In Catania decomposed lava is spread over the ground, greatly increasing its fertility. The crops of grain are large, and might be prodigious if agriculture were better understood. The papyrus, sugar cane, date palm, and other tropical plants flourish. The harvests are such that they recall to mind the words of Livy, in speaking of Sicily, "*Populorum Romano, pace ac bello, fidissimum annonæ subsidium*" (lib. xxvii. 5). In more recent times the restrictions on the exportation of grain served not only to keep agriculture from making any progress, but also to put a drag upon the commerce of the country; which, on every attempt made to raise itself, was met by fresh obstacles in the shape of new taxes. The Italian government has greatly alleviated the obstacles to agriculture, and the salutary effects of the change of system are already apparent. The soil produces corn, maize, flax, hemp; excellent cotton near Mazzara and in Catania; sugar, equal to that of the East Indies, along the southern coast; grapes, olives, saffron, oranges, lemons, citrons, potatoes, pomegranates, figs, pistachios, dates, castor-oil, mulberry, sumach, tobacco, and manna. The vine has been cultivated with the greatest care at Marsala since 1789, when an English firm, settled there, began to export it. In 1894 135,000,000 gallons of wine were produced.—Sicily possesses the best tunny-fisheries in the Mediterranean. The fisheries for coral at different places on the coast are also industriously carried on.

Manufactures, Commerce, etc.—The manufactures of Sicily are insignificant, and are nearly altogether confined to silk, cotton, and leather.—The most important articles of export are sulphur, sumach, fruits, and wine; of import, cottons, woollens, silks, linens, earthenware, hardware. Great Britain, France, and the United States are the countries with which the Sicilians chiefly carry on commerce. The statistics of exports and imports are untrustworthy, but the latter considerably exceed the former. In 1894, 633 miles of railways were in operation.

Religion, Education, etc.—With the exception of a comparatively small number of Greeks, and Jews, the inhabitants are all Roman Catholics; but though equally ignorant, they are not so superstitious as the Neapolitans; at least their superstition has not destroyed their love of political freedom, as has repeatedly been evinced in their history—most recently in the ardor with which they responded to the summons of Garibaldi to liberate themselves from the tyranny of the Bourbons. There are three universities—at Palermo, Catania, and Messina; and there were in 1892 66 high schools, 6 technical institutes, and 41 technical schools, besides a large number of elementary and primary schools.

Political Divisions.—Sicily is divided into 7 provinces or prefectures—viz., Palermo, Messina, Catania, Noto or Siracusa, Caltanissetta, Girgenti, and Trapani. Each province is subdivided into 3 or 4 districts, and these again into numerous *communi*, or "townships." Over the province is placed an *intendente*, or, as he is now called, a "prefect;" over the district a sub-prefect; and over the commune a *sindaco* ("syndic," or "mayor"). The prefect presides over every department of the provincial administration, and also over the provincial council—a body composed of from 15 to 20 land-holders, who meet once a year, and sit for 20 days, examining the accounts of the province, and framing the provincial budget. The two subordinate divisions have also their "councils;" and the members of all three are appointed either by the king, or by the prefect. Of course this insular self-government does not supersede the necessity of sending Sicilian deputies to the national parliament at Rome.

History.—Sicily, was inhabited, in prehistoric times, by a people who bore the name of *Siculi* or *Sicani*, and who, according to a universally received tradition—crossed over into the island from the southern extremity of the mainland. Their names and every fact that we can ascertain about them, lead to the supposition that they were members of the great Latino-Italian family that, entering Italy from the n., gradually pushed its way across the Apennines to the peninsula of Bruttium (see article *ROME*). Beyond this rational conjecture, however, we cannot proceed, and the actual history of Sicily only begins to emerge out of utter darkness with the establishment of Greek and Phœnician colonies. The earliest Greek colony, that of Naxos, was founded 735 B.C.; the latest, that of Agrigentum, 580 B.C. During the intervening century and a half, numerous important colonies were established (either directly from Greece or as offshoots from the older Greek settlements in the island); Syracuse (734 B.C.), Leontini and Catana (730 B.C.), Megara Hyblæa (728 B.C.), Gela (690 B.C.), Zancle, later Messina (date of origin uncertain), Acraë (664 B.C.), Himera (648 B.C.), Mylæ (date of origin uncertain), Casmenæ (644 B.C.), Selinus (628 B.C.), Camarina (599 B.C.), Agrigentum (580 B.C.). The earlier history of these cities is almost unknown. What is recorded is vague and general. We read that they attained great commercial prosperity, that they subjugated or wrested from the Siculi, Elymi, and other "native" tribes, large portions of neighboring territory; and that their governments (like those of the republics in the mother-country) were

at first oligarchical, and latterly democracies or "tyrannies;" but it is not till the period of the "despots" that we have detailed accounts. Then the cities of Agrigentum and Gela acquire prominence—the former, under the rule of Phalaris (q.v.), becoming, for a short time, probably the most powerful state in Sicily; and the latter, under a succession of able tyrants, Cleander, Hippocrates, and Gelon (q.v.), forcing into subjection most of the other Greek cities. Gelon, however, transferred his government to Syracuse (one of his conquests), which now became the principal Greek city of Sicily—a dignity it ever after retained. Contemporary with Gelon, and possessed of the same high capacity for governing, were Theron, "tyrant" of Agrigentum, and Anaxilaus, tyrant of Rhegium, and conqueror of Zancle, to which he gave the name of Messana. Meanwhile, the Carthaginians—a people wholly different from the Greeks, in language, religion, origin, and civilization—had obtained possession of the Phenician settlements in Sicily. The first appearance of the Carthaginians in the island dates from 536 B.C.; but the steady growth of the Greek cities in wealth and power, long confined their rivals to the north-western part, where their principal colonies were Panormus, Motya, and Soloeis. The first open trial of strength took place in the great battle of Himera, where the Carthaginian army was utterly routed by Gelon, and its leader, Hamilcar, slain. The Gelonian dynasty at Syracuse fell 466 B.C., after experiencing various fortunes. During the next 50 years the island had peace. In 410 B.C., however, the war between the Carthaginians and Greeks for the possession of the island was renewed. The successes of the former were great and permanent. Selinus, Himera, Agrigentum, Gela, and Camarina, fell into their hands in less than five years; and it was not till Syracuse had got a new "tyrant," the famous Dionysius (q.v.) the elder, that fortune again began to smile on the Greeks. Even he, however, could not wrest from the Carthaginians what they had already won; and after the war of 383 B.C., a peace was concluded, which left Dionysius in possession of the eastern, and the Carthaginians of the western, half of the island. The dissensions and tumults that followed the decease of Dionysius, illustrate forcibly the peculiar dangers to which the Greek republics, either at home or abroad, were prone; but we can only afford to notice the triumph of the popular party under Timoleon (343 B.C.), and the splendid victory of the latter over the Carthaginian generals, Hasdrubal and Hamilcar, at the river Crimisis, 340 B.C. Once more Greek influence was in the ascendant, but the rule of the bold and ambitious tyrant Agathocles (317–289 B.C.) proved in the main disastrous to Greek supremacy. After his death Syracuse lost her hold over many of the Greek cities, which established a weak and perilous independence, that only rendered the preponderance of the Carthaginians more certain. Finally, Pyrrhus (q.v.), king of Epirus, was invited over to help his countrymen, and in 278 B.C. he landed in the island. The brilliant adventurer—one of the most romantic figures in classic history—for a time swept everything before him. Panormus, Ercte, and Eryx were captured; and though he failed to make himself master of Lilybæum, he might probably have forced the Carthaginians to surrender it, had he not been thwarted in his designs by the miserable discords and jealousies of the people whom he came to save. As it was, Pyrrhus left Sicily in about two years; and in all likelihood the island would have sunk into a Carthaginian possession, had not a new power appeared on the stage—viz., the Roman. The struggle for supremacy between Rome and Carthage—the most tremendous struggle in ancient history—is sketched in the article *ROME*, and in the biographies of the leading generals, and, therefore, need not be narrated here. Suffice it to say, that in 246 B.C., Carthaginian Sicily, and in 210 B.C., the whole island became a Roman "province"—the first Rome ever held. Henceforth it shared the fortunes of the great state to which it was annexed, and its special history need only be rapidly glanced at. In 135–132 B.C., and again in 103–100 B.C., it was the scene of two formidable slave-insurrections, during which it was frightfully devastated. Its fertility, and the wealth of its citizens and landholders, were also powerful temptations to greedy and unscrupulous governors, of whom we have a specimen in Verres (pretor 73–70 B.C.), "damned to everlasting fame" in the orations of Cicero. Augustus visited Sicily after the close of the civil wars, and established some colonies; but it does not seem to have prospered under the empire; and in 440 A.D. it was conquered by the Vandals under Genseric. The Vandals, in their turn, were compelled to cede it (480 A.D.) to Theodoric king of the Ostrogoths, in whose hands it remained till 535 A.D., when Belisarius conquered and annexed it to the Byzantine empire. In this condition it remained till 827, when the Saracens invaded the island, and after a protracted struggle, lasting for 114 years, expelled the Byzantine Greeks, and made themselves masters of Sicily. They kept possession of it for upward of a century, but after a contest of 30 years, were driven out by Robert Guiscard (q.v.) and Roger de Hauteville, at the head of a body of Normans, aided by the "native" inhabitants, whom we conjecture to have been much the same as they were in the old classic times—for the successive waves of barbaric and Saracenic invasion that swept over the island, appear to have left little trace of their action. Even to this day it is highly probable that the people of Sicily are largely the descendants of the early Siculi. The Normans held rule in the island from 1072 to 1194; and the Norman "kingdom of Sicily and Naples," or "kingdom of the two Sicilies," dates from 1130, when Roger II. obtaining possession of most of the continental dominions of his uncle, Robert Guiscard, assumed the title of king. During the rule of the Swabian dynasty (see *HOHENSTAUFEN*, *HOUSE OF*), 1194–1258, the political

history of Sicily is the same as that of Naples; but in 1282, after the dreadful massacre of the French, known as the Sicilian Vespers (q. v.), it again became independent, chose for its king Pedro III. of Aragon, who was the sole representative by marriage of the house of Hohenstaufen, and remained in the possession of the Aragonese sovereigns till 1505, when the union of the crowns of Castile and Aragon—in other words, the rise of the Spanish monarchy in the persons of Ferdinand and Isabella—placed it under the dominion of Spain. The fortune of war also gave Ferdinand the possession of Naples; and the Spanish kings retained both countries until the war of the Spanish succession, 1700–13 (see SUCCESSION WARS). By the treaty of Utrecht (1713), Sicily was separated from Naples, and handed over to Victor Amadeus, duke of Savoy, who, however, restored it to the crown of Naples by the treaty of Paris, seven years after, receiving in exchange the island of Sardinia. From 1720 the two countries continued under the same dynasty, the house of Austria, 1720–34; and the Spanish Bourbons, 1734–1860 (if we accept the brief rule of the French in Naples, 1806–15, when Joseph Bonaparte, and afterward Joachim Murat, were kings), down to the period of Garibaldi's invasion (see ITALY, and GARIBALDI), which resulted in the annexation of both to the new kingdom of Italy under Victor Emmanuel.

SICKINGEN, FRANZ VON, 1481–1523; b. in the duchy of Baden; became a distinguished soldier, and ably supported the cause of the emperors Maximilian and Charles V. He was noted as the champion of the oppressed, resisting the despotism of princes and the arrogance of the clergy; supported Lutheranism in the Rhenish provinces, and as the patron of learning protected Reuchlin, Æcolampadius, and Ulrich von Hutten. Involved in a feud with Hesse and the Palatinate, he was mortally wounded while defending his castle.

SICKLES, DANIEL EDGAR, b. N. Y., 1825; educated at the university of New York; studied law and began to practice in 1844. He soon became a politician, served in several offices, was secretary to the English legation in 1853, and was member of congress, 1856–62. In 1859 he shot and killed Philip B. Key for alleged intimacy with his wife, and was tried for murder, but acquitted. In 1861 he raised and became col. of the Excelsior (New York) brigade. He commanded a brigade under Hooker, and at Antietam and Fredericksburg was at the head of Hooker's old division. At Chancellorsville and Gettysburg he commanded the 3d corps. In 1869 he became minister to Spain, resigning in 1874. From 1893 to 1895 he was a member of congress.

SICULIA'NA, a city of Sicily, province of Girgenti, and 9 m. n.w. of the city of that name. It stands on the sea, and has a small harbor. Pop. about 6,000.

SICYON, the principal city of a very small but exceedingly fertile state of ancient Greece, Sicyonia, situated in the n. of the Peloponnesus, having the Corinthian gulf for its northern boundary, with Achaia on the w., Phlius on the s., and Corinth on the east. The territory was level toward the sea, somewhat mountainous in the interior, and well watered by the two rivers Asopus and Helisson, between which on a triangular plateau was situated Sicyon, about 2 m. s. of the Corinthian gulf, and 10 n.w. of Corinth. Round the three sides of the plateau ran a wall, which combined with the precipitous nature of the heights that surrounded it rendered the position of Sicyon one of great strength. It is supposed that at one time it had, like Athens, a double wall reaching from the city to the port on the sea of Corinth. Sicyon was anciently celebrated as a chief seat of painting and statuary (tradition asserting that the former was invented there), it having given its name to a school of painting which included among its disciples Pamphilus and Apelles, both natives of Sicyon. It was also the native city of Aratus (q. v.), the gen. of the Achaean league. There exist at the present day a few remains of the ancient city, as well as of the more modern buildings erected by the Roman conquerors of Greece, near which stands a small modern village named *Vasilika*.

SIDA, a genus of plants of the natural order *malvaceae*, containing a large number of species, annual and perennial herbaceous plants and shrubs, mostly natives of warm climates and widely diffused. They generally abound in mucilage, and some of them are used in medicine in India, as the mallow and marsh-mallow are in Europe. They have also strong pliable fibers, which are employed for cordage and for textile purposes. —*S. tiliifolia*, an annual, has long been cultivated in China, where it is called *king-ma*, for the sake of its fiber, which is used like that of hemp. It is too tender for the climate of Britain, but its cultivation has been introduced into Italy and France.

SIDDONS, MRS. SARAH, was the daughter of Mr. Roger Kemble, a provincial actor, and was born at Brecon, in South Wales, on July 5, 1755. As a mere child she was brought on the stage on the occasion of a benefit of her father's, and from that time up to her 15th year she continued to act as a regular member of his company. An attachment having sprung up between her and a young Mr. Siddons, an actor, with the somewhat reluctant consent of her parents, she was married to him at Trinity church, Coventry, on Nov. 26, 1773, and in company with her husband went to act at the Cheltenham theater. Here she speedily drew great attention; and Garrick, hearing her praises in London, sent to Cheltenham a trusty emissary to report upon her. The result was an engagement offered her at the London Drury Lane theater, where, Dec. 29, 1775, she made her first appearance, acting Portia in *The Merchant of Venice* to the

Shylock of Mr. Garrick. Her beauty and fine person pleased the audience, but as an actress she made no great impression, and at the close of the season she failed to secure a re-engagement. It was considered that this was to some extent due to her having vexed the irritable vanity of Garrick by an unintentional error in stage business, which made him act with his back to the public in one of his pet passages, a mortification which the great man was little enough to remember and resent.

Leaving London thus in failure in 1776, in 1782 she returned to it to run a career of triumph as indisputably the greatest actress of her time. The intervening years she had passed in the exercise of her art on the stages successively of Birmingham, Manchester, York, and Bath, till the growth of her provincial reputation determined her recall to the metropolis. In 1784 her popularity was temporarily obscured by a calumny industriously circulated, which charged her with ungenerous and illiberal conduct toward certain of her fellow-performers; but with this trivial exception, till on June 29, 1812, in her great character of Lady Macbeth, she took her leave of the public, her course was one long series of successes. Subsequently she occasionally consented to reappear on the stage for charitable ends, or to promote a stage "benefit" in which she had a kindly interest. Her death took place in London on June 8, 1831.

As a tragic actress Mrs. Siddons has probably never been equaled in Great Britain; as a woman she was of unblemished reputation, and enjoyed the respect of all who knew her. She was the ornament of every society into which she went, and such was the estimation in which she was held, that she had access at will to almost any. Her genius is said to have been strictly a *stage* genius; elsewhere she seems to have been a woman of no extraordinary parts. But she had a certain way of making her mediocrities imposing. She carried her tragedy manners with her to the drawing-room or the dinner-table: Scott has recorded the amusement with which at Abbotsford he heard her stately blank verse to the domestic:

"I asked for water, boy! you've brought me beer;"

and Sidney Smith used to say it was never without a certain awe that he saw her "*stab the potatoes.*"

SIDE-BONES are enlargements situated above a horse's heels, resulting from the conversion into bone of the elastic lateral cartilages. They occur mostly in heavy draught horses with upright pasterns, causing much stiffness, but, unless when of rapid growth, little lameness. They are treated at first by cold applied continually, until heat and tenderness are removed, when blistering or firing must be resorted to.

SIDEREAL CLOCK, a clock so regulated as to indicate *sidereal time*. See **DAY**. The sidereal clock is a most important aid to the practical astronomer, and is one of the indispensable instruments of an observatory.

SIDEROGRAPHY (Gr. *sideros*, iron). The name applied by the inventor, Mr. Dyer, to a process of printing with compound iron (or rather steel plates, for they are case-hardened after engraving) plates, instead of plain plates of copper or steel. It is the plan now usually employed in printing bank-notes in which more than one color is given. The colored parts of the design are cut out of the main plates, and movable pieces are exactly fitted in, so that they can be retracted or pushed forward at will. They are withdrawn while the main plate is receiving its ink, and they are pushed forward beyond while receiving their supply of ink. This being done they are brought to one plane, and form a complete plate for printing from.

SIDEROX YLON, a genus of trees of the natural order *sapotacea*, having evergreen leaves and axillary clusters of flowers, natives of warm climates, and very widely distributed. They are remarkable for the hardness of their wood, which is sometimes called iron-wood, and is at least in some species so heavy as to sink in water.

SIDGWICK, HENRY, M.A., was born at Skipton, in Yorkshire, in 1838, and was educated at Rugby and Trinity College, Cambridge. He was Fellow of Trinity College from 1859 to 1869; and Lecturer from 1859 to 1875, when he was appointed Prælector of Moral and Political Philosophy; and in 1883 he was appointed Knightbridge Professor of Moral Philosophy. Mr. Sidgwick is the author of works on *The Methods of Ethics* and the *Principles of Political Economy, Elements of Politics* (1891). He took a prominent part in the promotion of the higher education of women at Cambridge, and was one of the founders of Newnham college.

SIDI MOHAMMED, 1803-73; b. Morocco; son of Abderrahman, whom he succeeded in 1859 as emperor of Morocco. He was soon involved in a war with Spain, caused by the robberies of the Rif pirates, was defeated by the Spanish under Prim and O'Donnell, and obliged to pay Spain an indemnity of 20,000,000 piasters. His introduction of reforms and the commercial concessions which he granted to foreigners caused several insurrections, in quelling one of which he lost his life.

SID/LAW HILLS. See **FORFARSHIRE** and **BIRNAM**.

SIDMOUTH, a market t. and watering place on the s. coast of Devonshire, at the mouth of the little river Sid. Sidmouth was a borough and market-town, governed by a port-reeve, as early as the 13th century. It was anciently a place of some importance as a fishing-town and seaport, but the fishery has declined, and the harbor is in great measure filled up with sand and shingle, so that it is now accessible to small boats only. The town has for many years past been a favorite watering-place, remarkable for the

mildness and salubrity of its climate. The hills on each side of the valley of the Sid rise to a considerable height, and, where they terminate on the sea coast, form bold and lofty cliffs, e. and w. of the town, known respectively as Salcombe hill and High peak, about 500 ft. above the sea. Owing to the narrowness of the valley, the town presents no large frontage toward the sea; but the esplanade, protected by a sea wall 1700 ft. in length, built in 1838 to stop the encroachment of the sea, forms an excellent promenade. Villas and detached houses extend for some distance inland up the valley of the Sid on both sides of the stream. The town is neatly though irregularly built, lighted with gas, and paved, and contains baths, public rooms, etc. Pop. '80, 3,501. Some Roman remains have been found here. Sidmouth gives the title of viscount to the Addington family.

SIDNEY, ALGERNON, grand-nephew of the famous sir Philip Sidney, was b. in the year 1622. He received a careful education, and accompanied his father, the earl of Leicester, to Denmark and France, whither the latter had been sent on embassies. In 1641 he served with some distinction against the rebels in Ireland, of which country his father was then lord-lieut. for the king. Subsequently, in 1643, along with his elder brother, the viscount Lisle, he crossed to England, ostensibly to take service under the king, then at war with his parliament. The two brothers, however, on their arrival, joined the parliamentary forces. At the battle of Long Marston Moor, in which he was sharply wounded, Algernon's courage and capacity were conspicuous; and in evidence of the estimation in which he came to be held by his party, we find him, in 1646, lieut. gen. of the horse in Ireland, and governor of Dublin; and, subsequently, in 1647, after receiving the thanks of the house of commons for his services, appointed governor of Dover. The year before, he had been returned to parliament as member for Cardiff. In 1648 he was one of the judges at the king's trial, and though, for some reason not explained, he neither was present at the passing of sentence, nor signed the warrant of execution, his general approval of the proceedings is not doubted. He is reported to have afterward spoken of the execution as "the justest and bravest action that ever was done in England or anywhere else." In principle a severe republican, he resented the usurpation of power by Cromwell, and during the protectorate lived in retirement at the family seat of Penshurst, in Kent. In 1659, on the meeting of the restored parliament, Sidney was again in his place. He was nominated one of the council of state, and shortly after dispatched to Denmark on a political mission. After the restoration, he lived precariously on the continent, flitting about from place to place, but in 1677, a pardon was procured him from Charles II., and he returned to his native country. Nevertheless, he was still obdurately republican in his opinions, and it is undoubted that he schemed for the overthrow of the monarchy, and the establishment of a republic in its stead; for this end he solicited the aid of the French monarch, and there is evidence of his having been supplied with money by Barillon, the French ambassador. Obscurely his designs were suspected, and in June, 1683, when the Rye house plot was announced, the opportunity was seized to get rid of a man felt to be dangerous. Along with his friend lord Russell and others, he was arrested, and committed to the tower. On Nov. 21 he was tried for high treason before the brutal Jefferies, and on the merest mockery of evidence, found guilty, and condemned to die. On Dec. 7 he was beheaded on Tower hill. He met his death with heroic firmness, amid general sympathy and indignation. He has ever since enjoyed a sort of canonized reputation as a patriot hero and martyr, and it cannot be held undeserved, narrow and impracticable as we must admit his views to have been. In the history and theory of government, Sidney was more deeply learned than any man of his time. His *Discourses concerning Government* were first published in 1698; in 1704 another edition was issued, a third appeared in 1751, and the fourth in 1772. Sidney's life has been written by S. W. Meadley (Lond. 1813). See also Blencow's *Sidney Papers* (Lond. 1813).

SIDNEY, Sir PHILIP, the son of sir Henry Sidney, and Mary, sister to Robert Dudley, the favorite of queen Elizabeth, was b. at Penshurst, in Kent, on Nov. 29, 1554. When 10 years old, he was sent to school at Shrewsbury, whence, in 1569, he went to Christ church, Oxford. From Oxford he passed to Cambridge, which he left with a high reputation for scholarship and general ability. In 1572, as the custom then was for young men of rank, he went abroad on his travels. He was in Paris when the massacre of St. Bartholomew took place, and narrowly escaped being one of its victims. Thereafter, he visited Belgium, Germany, Hungary, and Italy; and in 1575 he returned home, perfected in all manly accomplishments. His uncle, Dudley, earl of Leicester, was at this time in the zenith of his fortunes, and for Sidney a court-career lay temptingly open. As a courtier, his success was great; and with queen Elizabeth he became, and continued while he lived, a special favorite. In 1576, as a mark of her approval, he was sent on an embassy to the court of Vienna, from which he returned in the course of the year following. Shortly after, he had the boldness to address to the queen a "remonstrance" against her proposed marriage with Henry duke of Anjou, a union to which she seemed herself not indisposed. It is significant of the high favor in which he was held by her, that Elizabeth, imperious as she was in temper, and little inclined to brook such interference, seems scarcely at all to have in this instance resented it. About this time, a quarrel with the earl of Oxford led to Sidney's

temporary retirement from court, during which, at Wilton, the seat of his brother-in-law, the earl of Pembroke, he wrote his celebrated *Arcadia*. In 1583 he consoled himself for the marriage of Lady Penelope Devereux, to whom he had been ardently attached, and who figures as the Stella of his poems, by himself marrying Frances, the daughter of sir Francis Walsingham. By this lady he had one daughter, who survived him. In the spring of 1585 he is said to have meditated sailing with sir Francis Drake in an expedition against the Spaniards in the West Indies, but to have been expressly forbidden by Elizabeth, on a ground of anxiety "lest she should lose the jewel of her dominions." It does not seem nicely consistent with this pretty story, that later in the same year she appointed him governor of Flushing, whither he went to take part in the war then being waged between her allies, the Hollanders, and the Spanish. As it proved, she thus sent him to his death. At the battle of Zutphen, in Gelderland, after behaving with conspicuous gallantry, and having a horse killed under him, he received a musket-shot in the thigh, and after lingering for some days in great suffering, he died at Arnheim on Oct. 7, 1586, in the 33d year of his age. A beautiful trait of humanity is recorded of him as he was being borne wounded from the field. He complained grievously of thirst, and a bottle of water was procured for him, from which, as he was about to drink, he was touched by the wistful look up at it of a mortally wounded soldier, who lay close by, and taking it untasted from his lips, he handed it to his fellow in need, with the words: "Thy necessity is yet greater than mine." The estimation in which Sidney was held by his countrymen was shown in the passion of grief with which the news of his death was received. His body was brought to England, and after lying for some time in state, was buried with great solemnity in the old cathedral of St. Paul's, a general mourning on the occasion being observed throughout the country. The universities issued three volumes of elegies on his death, and Spenser, in his *Astrophel*, mourned for the loss of one who as a friend had been dear to him.

The love and admiration which Sidney won from his contemporaries was mainly a tribute to the singular beauty of his character. His short life was illustrated by no brilliant achievement; and his literary genius, though true and exquisite in its kind, would scarcely of itself have sufficed to account for the fervor of regard he inspired. But the purity and nobility of his nature, and the winning courtesies in which its gentle magnanimity expressed itself, took captive all hearts while he lived, and have since kept sweet his memory. "Sublimely mild, a spirit without spot," he lives in the history of his country as a rare and finished type of English character, in which the antique honor of chivalry is seen shading into the graces of the modern gentleman. His *Arcadia*, overrun as it is with the fantastic affectations of the time, may still be recognized by the reader who has patience to peruse it, as a work of indisputable genius, flushed with the lights of a fine imagination, and in its purity and tenderness of sentiment, giving an authentic reflex of the lovely moral nature of the writer. His other chief work, the *Defense of Poesie*, published in 1595, after all that has since been written in the way of philosophical exposition on this and cognate subjects, will even now be found to repay the attention of the reader. Many of his shorter poems, more especially some of his sonnets, are also of rare merit. See Fulke Greville's biography of Sidney, Zouch's memoirs of Sidney (1808), and H. R. Fox Bourne's *Memoirs of Sir Philip Sidney* (1862).

SIDNEY SUSSEX COLLEGE, Cambridge, was founded in 1598 by lady Frances Sidney, countess of Essex, or rather by her executors, in obedience to the instructions of her will. They obtained of queen Elizabeth a mortmain for the purpose, and purchased of Trinity college the site of the ancient convent of Franciscans, or Gray friars. There are 10 fellowships.

SIDON (Hebr. Zidon, perhaps "fishing-place"), anciently, a city of Phenicia, situated on the e. coast of the Mediterranean, in lat. 33° 34' 5" n., 45 m. s. of Berytus. It was built on a rising mound, protected by the sea on the n. and w; while the bed of a river formed a natural fosse to the s., and the high hills shielded it to the e.; a double harbor gave shelter to its ships both in summer and winter. It soon rose, both by its exceptional position and the daring and enterprising character of its inhabitants, to the highest rank among the cities of Phenicia (q. v.), so that the whole country is sometimes designated by the name of Sidon, "the great," "the metropolis." The extensive commerce of Sidon is well known from ancient authorities. Its colonies extended over the coast of Asia Minor and the adjacent islands, the coast of Thrace and Eubœa, and even some parts of Sicily, Sardinia, Spain, the coast of Cornwall and the Baltic shores, the northern parts of Africa, and, in fact, nearly the whole of the ancient world. Their manufactures of glass and linen, purple dye and perfumes, were sources of unbounded wealth: and, whether they were the skillful workers, or merely the exporters and traders of those "divine" works in gold and silver, ivory and bronze, which were the marvel of both Greeks and Hebrews, so much seems certain, that they managed to be considered unanimously the most skillful workmen of their time. Although one of the cities assigned to the Israelites by Joshua, it never in reality belonged to them, but, on the contrary, was every now and then in arms against them, either singly, or in league with some of their deadliest enemies, and even subjugated them for a time. After being conquered itself by Tyre, the daughter-city, it attempted to throw off the

yoke at the invasion of Phœnicia by Shalmanezzer, to which king it surrendered. Under Assyrian, Chaldean, and Persian domination, it retained a kind of independence for its internal affairs, and under the Persians, actually reached its highest prosperity. But an unsuccessful revolt against that power, under Oechus, ended in its temporary ruin (351 B.C.). Speedily rebuilt and repeopled, it opened its gates to Alexander the Great (333 B.C.), and from that time forth it fell successively into the hands of Syrian, Greek, and Roman rulers. During part of the 17th and 18th centuries, it again became an important place of commerce; but misrule and violence put an end to its rising prosperity, and the number of its inhabitants has sunk to about 10,000. There is still some trade in silk, goatskins, oil rags, tobacco, and fruit. It is now called Saida, occupies a place somewhat to the w. of the ancient city, and belongs to the Turkish pashalic of Acre. In 1887, 22 sarcophagi of magnificent workmanship were discovered in the neighborhood. See PHœNICIA.

SIEBENBÜRGEN (Seven Castles), the German name of the Austrian principality of Transylvania (q.v.).

SIEBENGEIRGE, a collection of conical heights in Rhenish Prussia, on the right bank of the Rhine, about 22 m. above Cologne. The highest of the peaks is the Drachenfels (q.v.), 1065 ft. high.

SIEBOLD, KARL THEODOR ERNST VON, a distinguished physiologist and zoologist, b. in Würzburg, Feb. 16, 1804. He was educated at Göttingen and Berlin, became, in 1835, director of the lying-in-hospital at Dantsic, in 1840 professor of physiology at Erlangen, in 1845 at Freiburg, in 1850 at Breslau, and in 1853 professor of physiology and comparative anatomy, and later of zoology, at Munich. His researches in the field of *protozoa*, the development of *medusæ*, and natural history of tape-worms, are particularly valuable. His writings include: *Observationes de Salamandris et Tritonibus* (1828); *Lehrbuch der vergleichenden Anatomie der wirbellosen Tiere* (1848); *Über die Band- und Blasenwürmer* (1854); *Die Süßwasserfische von Mitteleuropa* (1863); and many others. Siebold died at Munich, April 7, 1885.

SIEBOLD, PHILIPP FRANZ VON, a noted German naturalist; b. in Würzburg, Feb. 17, 1796. After studying medicine and natural sciences at Würzburg, he went, in 1822, to Batavia as Dutch sanitary officer, and the following year to Japan, as attaché. In 1826 he was at Yeddo, but was forced to leave, owing to an infringement of court etiquette, and in 1830 returned to Holland. During the years 1859-62, he was again in Japan, after which he returned to his birthplace, and died in Munich, Oct. 18, 1866. His valuable collections in the fields of ethnography and natural history are preserved in the museum at Leyden. His published works include: *Nippon; Archiv zur Beschreibung von Japan* (1832-51); *Fauna Japonica* (1833-51); *Flora Japonica* (1835-70); *Bibliotheca Japonica* (1833-41); and many other works relating to Japan.

SIEDL'CE, a government in w. Russian Poland, bounded on the n.e. and e. by the Bug river; 5535 sq. m.; pop. '94, 752,152.

SIEGE (Fr. a seat, a sitting down) is the sitting of an army before a hostile town or fortress with the intention of capturing it. If a fortress of great strength has to be reduced, and if the force of the enemy in the vicinity has been either subdued or held in check by a covering army, the place is at once invested on all sides by rapid movements. This step constitutes merely a blockade; and if time be of little importance, is a sufficient operation, for hunger must sooner or later cause the fortress to surrender; but if more energetic measures are required, the actual siege must be prosecuted. Advantage is taken of any hidden ground to establish the park of artillery and the engineers' park; or if there be none, these parks have to be placed out of range. The besieging force is now encamped just beyond the reach of the guns of the fortress; and their object is to get over the intervening ground and into the works without being torn to pieces by the concentrated fire of the numerous pieces which the defenders can bring to bear on every part. With this view, the place is approached by a series of zigzag trenches so pointed that they cannot be enfiladed by any guns in the fortress. In order to accommodate the forces necessary to protect the workers, the trenches at certain intervals are cut laterally for a great length, partly encircling the place, and affording safe room for a large force with ample battering material. These are called *parallels*, and they are generally three in number. The distance of the first parallel will increase as small-arms become more deadly; but with the old smooth-bore muskets it was usual to break ground at 600 yards from the covered way of the fortress, while at Sevastopol ground was broken at 2,000 yards, and in the siege of Paris by the Germans the lines were begun at least 4 m. from the city. The locality of the parallel being decided on, a strong body of men is sent to the spot soon after nightfall. The attention of the garrison is distracted by false alarms in other directions. Half the men are armed cap-à-pie, and lie down before the proposed parallel; while the other half, bearing each pick and shovel, and two empty gabions, prepare for work. Each man deposits the gabions where the parapet of the trench should be. He then digs down behind them, filling the gabions with the earth dug out; and, after they are filled, throwing it over them, to widen and heighten the parapet. Before daylight the working-party is expected to have formed sufficient cover to conceal themselves and the troops protecting them. During the day, they—being concealed from the garrison—widen and complete their parallel, making it of dimensions sufficient to allow of wagons and bodies of troops with guns passing along. During the same night, other parties will have been at work at zigzags of approach from the depots

out of range to the first parallel, which zigzags will be probably not less than 1000 yards in length. As a rule the defenders will not expend ammunition on the first parallel, for

FIG. 1.—Siege Works.

bodies of cavalry, who are kept at hand to resist sorties from the garrison. The length of the parallel is usually made sufficient to embrace all the works of two bastions at least. Sites are then chosen for batteries, C,C, which are built up of fascines, gabions, sandbags, and earth. They are placed at points in the parallel formed by the prolongation of the several faces of the bastions, ravelins, and other works of the fortress, which faces the batteries are severally intended to enfilade by a ricochet fire. Other batteries will be formed for a vertical fire of mortars and shell-guns. By these means it is hoped that the traverses on the hostile ramparts will be destroyed, the guns dismounted, and the defenders dispersed, before the final approaches bring the assailants to the covered way. The sappers will now commence their advance toward the points, or salient angles, of the two bastions to be attacked. If, however, the trench were cut straight toward the fortress, its guns could easily destroy the workmen and enfilade the approach. To prevent this, it is cut in short zigzags—as at D—the direction always being to a point a few yards beyond the outmost flanking works of the garrison. The side of each trench nearest the fortress is protected by gabions and sandbags, as in the case of the parallel. At intervals, short spurs of trench, incipient parallels, are cut, as at E, to contain small-arms-men, to act as guards to the sappers. The second parallel is about 300 yards from the enemy's works and has to be more strongly formed than the first. It often terminates in a rebout, F, to hold some light artillery and a strong force of infantry, who could assail any sortie in flank; or it may run into the first parallel, as G, giving easier access for troops than through the zigzags. The second parallel is revetted with sandbags, in which loopholes are left for musketry. After passing the second parallel, the angles of the zigzags become more acute, to prevent enfilading. At about 150 yards, certain demi-parallel, H, are cut, and armed with howitzer batteries, to clear the covered-way, while riflemen also act from it. The third parallel is at the foot of the glacis. Thence the place, after being sufficiently battered, is taken by a storming-party, who make their way over the glacis, or the covered-way is topped by the double sap, which is a safer plan for the army generally, though much more deadly to the sappers. When the crest of the covered-way has thus been reached, batteries of heavy artillery will be there established, for the purpose of breaching the walls of the ravelin and bastion; while at the same time miners will first seek to destroy the defenders' counter-mines (which would otherwise be likely to send these batteries into the air), and then will excavate a tunnel to the ditch, at the foot of the counterscarp. If the branch becomes practicable, a storming-party will emerge from this tunnel or gallery, and seek to carry the opposite work by hard fighting. If inner works still subsist, which would tear assailants to pieces, the double sap may be continued across the ditch, if a dry ditch, right up the breach, that counter-batteries may be formed. If the ditch be wet, means must be adopted for a causeway or a bridge. By these means, however obstinate may be the defense, if the besieging force be sufficiently strong, and aid do not arrive from without, the ultimate success of the attack becomes certain. Vauban raised attack to a superiority above defense, first, by the introduction of ricochet fire, which sweeps a whole line; and secondly, by originating parallels. Before his time the whole attack was conducted by zigzag approaches; in which the troops actually in front could be but few, and were therefore unable to withstand strong sorties of the garrison, who, in consequence, frequently broke out and destroyed the works of the besiegers, rendering a siege an operation of a most uncertain character. During the civil war, the following important siege operations occurred: the investment of Yorktown by the army and Gen. McClellan, which occupied the month of April, 1862, the position being evacuated May 3; the siege of Charleston, S. C., which continued at intervals during the war, until its evacuation by the confederates in Feb., 1865, after the capture of Columbia by Gen. Sherman.

its extent (often several miles) will render the probability of doing material damage extremely small. For this reason also, the dimensions of the parapet and its solidity are of far less importance in the first parallel than in the more advanced works of attack. The first parallel, AAA, fig. 1, being completed, the engineers select points near its extremities, at which they erect breast-

the movement against, and siege of, Corinth, Miss., April 15–May 30, 1861; siege of Knoxville, Tenn., by Gen. Longstreet in Dec., 1861; siege of Atlanta, Ga., July 22–Sept. 1, 1864, by Gen. Sherman; operations against Vicksburg, May–July, 1863, by Gen. Grant, resulting in its surrender July 4; siege of Petersburg, Va., June, 1864–April, 1865.

SIEGE-ARTILLERY is heavy ordnance used for battering purposes, and of too weighty a character to take the field.

SIEGEN, a manufacturing t. of Prussia, in Westphalia, stands on the Sieg, 47 m. s.e. of Cologne. In 1895 it had 19,303 inhabitants, who are engaged in manufacturing leather, cotton, and woolen goods. Siegen is also said to produce the best iron in the w. of Germany. In the vicinity are numerous iron mines and smelting furnaces. Its iron and steel wares are noted. There are iron, copper, and sulphuret of lead and zinc mines in the vicinity.

SIEGFRIED. See **NIBELUNGENLIED**.

SIEMENS, ERNST WERNER VON, b. at Lenthe, near Hanover, in 1816. He was educated in the gymnasium of Lübeck and in the school of artillery and engineering of Berlin, and entered the Prussian army as an artillery officer in 1838. He studied chemistry and electro-magnetism, and invented a process for electro-plating in 1841. He was the first to explode a submarine mine by electricity (1848). After 1849 he was engaged in the establishment of telegraph lines, particularly through Russia, Brazil, Spain, and northern Germany. His researches in electricity resulted in discoveries and improvements of great value, one of which was the determining of the locations of injuries in submerged cables, and also of charging them in order to reduce the disturbing influence of induced currents. He d. in 1892.

SIEMENS, KARL WILHELM (Sir Charles William), physicist, brother of the preceding, b. at Lenthe, near Hanover, 1823. He was educated at Göttingen; went to London in 1843, and founded there in 1853 a branch of the Berlin establishment, making telegraph instruments at Woolwich, and having steel works at Landore in Wales. He was the author of numerous inventions, of which the principal are a process of "anastatic printing;" a chronometric governor for controlling the motion of astronomical instruments; a regenerator for recovering the heat emitted at the exhaust port of caloric engines; a water-meter extensively used in Europe; (in connection with his brother Frederick) a regenerating gas furnace for the production of high-quality steel, and a rotary furnace for making iron and steel direct from the ore. He was also connected with telegraph engineering, from 1848. He was author of *On a Regenerative Condenser* (1850); *On the Conversion of Heat into Mechanical Effects* (1853); *On a Regenerative Steam-Engine* (1856); and *On the Increase of Electrical Resistance in Conductors, with Rise of Temperature, and its application to the Measure of Ordinary and Furnace Temperature* (1871). He was D.C.L. of Oxford, a fellow of the Royal society, and a member of all the great technological and scientific bodies of England and the continent of Europe. He d. 1883.

SIENKIEWICZ, HENRYK. The greatest living Polish novelist, born in 1846, at Vola Orkzeiska, in Russian Poland, and educated at the university of Warsaw. In 1872 he published his first story, *No one is a Prophet in his own Country*, which was favorably received. Four years later he visited America and his American letters published in the Warsaw *Gazeta Polska*, under the pseudonym of "Litvos," were widely read. He has since written a long series of novels, which have given him an international reputation, and have been widely translated. The following have appeared in English: *With Fire and Sword*; *The Deluge*; *Pan Michael*; *Without Dogma*; *Quo Vadis?*; *Lillian Morris*, and other Stories; *Yanko the Musician*, and other Stories.

SIENNA, a city of central Italy, 60 m. s. of Florence by railway. Pop. '95, 29,800. It is situated on three little hills, separated from each other by three valleys, and higher than the other hills surrounding them. Its climate is on this account very salubrious, notwithstanding the deficiency of water caused by its elevated position; to remedy which, subterranean aqueducts had been excavated, 5 m. in length, some of them dating as far back as the Roman dominion. Its environs are not beautiful, consisting of naked clay hills, capped with sandstone, but the city is surrounded by trees and avenues, which have a fine effect. The handsome square, Piazza del Campo, is one of the finest in Italy. Eleven streets lead out of it, and it is surrounded by handsome buildings. In this square there is also the famous tower called the *Mangia*, 635 ft. high; there are also other towers here and there, seen from a great distance—remnants of the inhabitants of the feudal lords. The streets are narrow, some paved with tessellated bricks, and others flagged. There are many ancient Gothic palaces, not remarkably handsome. In the Piazza del Campo stands the Palazzo Pubblico, built in the 13th c., in which there are magnificent rooms, and paintings by eminent artists. Sienna has a fine cathedral, erected, it is said, on the foundations of the temple of Minerva, begun in 1059; the façade built in the 13th century. It is faced with red, black and white marble, and is covered with ornaments and sculptures. The pavement is of marble tessellated, representing many biblical subjects. In the different chapels, and in the baptistery, there are frescoes, paintings, and statues, by a number of distinguished

masters. The other churches are also rich in works of art. Many fine paintings are to be seen in the church of St. Augustine and other churches, and in many private palaces. Sienna is an archiepiscopal see. The Siennese are singularly industrious, and have numerous manufactories of cloth and woolen, silk and linen stuffs, of felt and straw hats, and of furniture. There are marble quarries in the neighborhood. There is a university, founded in 1321, famous especially as a school of medicine, which has upward of 100 students. The Italian spoken at Sienna is reckoned among the purest.

Sienna was founded as a Roman colony in the time of Julius Cæsar, under the name of Sena, or Sena Julia. There are no remains of antiquity; and it does not appear to have been a place of any consequence until the middle ages, when it became one of the powerful city republics of Italy. It embraced the Ghibelline cause, and in conjunction with the forces of Pisa, defeated the Tuscan Guelphs, in the memorable battle of Monte Aperto (1260). At the height of its greatness it is said to have contained 200,000 inhabitants. Sienna produced a "school" of artists, of whom the most distinguished names are Guido da Siena, Simone Memmi, Sodoma, Beccafumi, and Baldassare Peruzzi.

SIENNA EARTH. See BURNT SIENNA.

SIERRA, a name applied in Spain, and in countries in which the Spanish language has prevailed, to a ridge of mountains. The word means *saw*, and is descriptive of the notched or saw-like sky-line of certain mountain-ranges.

SIERRA, a co in n.e. California, adjoining Nevada on the e.; drained by the forks of the Yuba river; 900 sq.m.; pop. '90, 5051, chiefly of American birth; inclu. Chinese. The surface is mountainous, as the county lies among the peaks of the Sierra Nevada, of which some are from 6,000 to 8,000 ft. high. The climate is severe; and but a small part of the surface suited for agriculture. Gold is found in large quantities, and there are 6 quartz-mills. Co. seat, Downieville.

SIERRA LEONE (Mountain of the Lion), a British colonial settlement on the Sierra Leone coast, western Africa. The settlement consists chiefly of a peninsula, about 25 m. long, from n. to s., and 12 m. broad; but several islets, as the isles de Loss and the Banana islands belong to it. Area, according to latest returns, 15,000 sq.m.; population, '91, 180,000, but of Sierra Leone proper in that year, the population was reported to be 74,835, of whom 224 were whites, chiefly of English birth. In 1883 Great Britain annexed an additional strip of territory, extending from Sherboro to near the Liberian borders. Along the coast stretches a belt of rich low-lying land, and elsewhere in the colony there are fertile tracts; but the interior is a mass of rugged mountains, with a generally barren soil. The climate is humid and unhealthy—the wet season, lasting from May to November, being specially pestilential. Tropical fruits and plants grow luxuriantly in the more favorable regions, and coffee, sugar, indigo, and cotton have been introduced by the British. In 1895 the exports amounted to £452,604, the chief articles being gold, benni seed, ground-nuts, palm-oil, hides, palm-nuts, kola nuts, india-rubber and copal. In the same year the imports amounted to £427,337, and the chief articles were cotton goods (nearly one-half of the whole value), gunpowder, ready-made apparel, hardware, tobacco, and rum. The revenue in 1895 amounted to £97,851, and the expenditure to £96,690. The public debt of Sierra Leone (1895) was a loan of £50,000, payable 1896-98. The colony is ruled by a crown-appointed governor, assisted by a council. In 1866 Sierra Leone, the Gambia, the Gold Coast, and Lagos were placed under one general government, to be called the "government of the west African settlements."

The settlement of Sierra Leone was established in 1787, when 470 destitute negroes were removed to it from London by a body of philanthropists; and 1196 negroes were sent to it from Nova Scotia—the climate of which had proved too severe for them—in 1790. The population was also increased by other bands of people of color; and after the abolition of the slave trade in 1807, the slaves captured by British cruisers were put ashore, and settled here. In 1820 the settlement contained only 12,000 inhabitants, or less than a sixth of its present population. Capital, Freetown; pop. '91, 30,033.

SIERRA MA'DRÉ, a name given to central portions of the great chain of Cordilleras or Rocky mountains, in Mexico, from lat. 19° to 25° n., and in New Mexico, to the great western range, from lat. 34° to 38° north. These ranges, but partially explored, contain some of the richest silver mines in the world.

SIERRA MORENA, a mountain-range in Spain, on the southern border of New Castile, and between the modern provinces of Ciudad Real and Jaen. It separates the upper portions of the basins of the Guadiana on the n., and of the Guadalquivir on the s., and rises in its highest point to 5,500 ft. above the sea. It is frequently mentioned in *Don Quixote*, and is the scene of many of the incidents therein described.

SIERRA NEVA'DA (*Snowy Range*), a mountain range of Spain in Andalusia, extending e. from Padul, 12 m. s. of Granada, to the frontiers of the modern province of Almeria, is 75 m. in length, from 20 to 30 m. in breadth, and covers an area of upward of 1000 sq. miles. It is continued on the n.e. by the Sierra de la Filabras, and

forms a portion of the watershed between the streams that flow into the Mediterranean and those that flow into the Atlantic. The peak of Mulhacen reaches a height of 11,420 ft., and is the highest summit not only of the Spanish peninsula, but of the whole of Europe w. of the Alps. The peak of Veleta is 11,387 ft. high. The range receives its name from the perpetual snow which covers the highest summits.

SIERRA NEVADA, a range of mountains in California, forming a portion of its eastern boundary, is the source of a multitude of rivers, which swell the Sacramento and San Joaquin. The range extends from n.w. to s.e. 450 miles, and is united to the Coast range, which runs parallel with the Pacific, by mount San Bernardino. Among the higher peaks of the Sierra Nevada are mounts Whitney, 14,898 ft.: Brewer, 13,886; Lyell, 13,042; and Dana, 12,992. Here are immense deposits of gold quartz, with steam and water power crushing-mills; deep tunnels and mines, increasing with their depth their yearly product.

SIESTA is a Spanish word meaning literally "a sitting down," and is used in speaking of the rest taken within doors during the heat of the day.

SIEYÈS, EMMANUEL JOSEPH, Comte, who, as the abbé Sicypès, prominently figures in the history of the French revolution, was born at Fréjus, May 3, 1748. He was educated at the university of Paris with a view to his entering the church; and on the completion of his studies he obtained the appointment at Treguier, in Bretagne (1775), whence, in 1780 he was transferred to the cathedral of Chartres, of the diocese of which he became chancellor and vicar-general. He had early imbibed the extreme liberal opinions on all matters social and political which were preparing the French revolution; and when, in 1789, the states-general were summoned, he issued his famous pamphlet, entitled *Qu'est-ce que le Tiers État?* This work, which claimed for the people political recognition, naturally enough obtained an immense popularity for its author, and procured his election as one of the deputies for Paris. Mainly through his urgency and influence it was that, on June 16, 1789, the representatives of the people took the decisive step of constituting themselves into an independent body, and became the national assembly. Of this body he continued for some time to be one of the most prominent and leading figures. In 1791 he was elected to the legislative assembly, then convened, as member for the department of Paris. By this time, however, he had sunk somewhat from his first pre-eminence; bolder and fiercer spirits had passed him in the race for power and popularity, and where he had once led, he now reluctantly followed. In the convention of 1792, to which he was elected as deputy of the department of La Sarthe, he prudently refrained from any active participation in the debates, and on the occasion of the king's trial he recorded a silent vote. While Robespierre and his party were in power, he consulted his safety by retiring from Paris. When afterward asked what he had done during the reign of terror, he quietly replied: *J'ai vécu* ("I have lived"). On the fall of Robespierre he returned to his post in the convention, and resumed his active interest in affairs, becoming a member of the new committee of public safety. He was engaged chiefly in the department of foreign policy, and he went as ambassador to Holland and Berlin successively to negotiate treaties of alliance. He became a member of the directory in 1799, and among other reactionary measures, he succeeded in closing the celebrated Jacobin club. Perceiving that a stable government was on no other terms possible, he became anxious to secure the co-operation of some powerful military leader, the more particularly as he was ambitious above all things of giving France a "constitution" (of which he had drawn up one or several); and on the return of Bonaparte from Egypt, he entered into a league with him, the result of which was the revolution of the 18th Brumaire (Nov. 9, 1799), and the institution of the consulate. Sicypès, Napoleon, and Roger Ducos being the three first consuls. Speedily, however, Sicypès discovered in his new ally his master. As to the distribution of power in the new constitution to be formed, he and Napoleon differed irreconcilably; the man of bayonets was the stronger; his political nostrums never got beyond the paper on which they were written; and finally, in disgust at the subordinate position into which he found himself about to sink, Sicypès threw up his place in the government. As a reward of his services, he received on his retirement a sum of 600,000 francs and the estate of Crosne; afterward exchanged for the equivalent of a splendid hotel in Paris and the lands of Fainanderie, in the park of Versailles. Also the title of count was conferred upon him. Subsequently the presidency of the senate was offered him, but he declined it, and never afterward concerned himself in public affairs. Banished at the restoration, he did not return to France till after the revolution of 1830; and in Paris, on June 20, 1836, he died. During the revolution Sicypès drew up a good many papers of one kind and another; but he is chiefly remembered for his plan of a new constitution, which, however, is very little known. Mignet's *Histoire de la Révolution* contains a description of it; and under the title of *Théorie Constitutionnelle* of Sicypès, and *Constitution de l'An VIII.*, M. Boulay (de la Meurthe) published (Par., 1836) from Sicypès own *Mémoires Inédits* a more detailed account.

SIGEL, FRANZ, b. Zinsheim, Baden, 1824; educated at the military school at Carlsruhe; adjt. in the army of the grand-duke of Baden, 1847. Resigning his commis-

sion in the army he participated in the revolution of 1848, and was appointed minister of war by revolutionary leaders in the same year. He fought against the Prussians, carried the remnant of his forces into Switzerland, and, expelled from thence, took passage for this country, where he taught mathematics in Dr. Rudolph Dalon's academy in New York, and married his daughter. He joined the state militia; commissioned maj. of the 5th regiment. He was a professor in a college in St. Louis, Mo., 1858. At the beginning of the war against the South he entered the union army as col. of the 3d Missouri volunteers, assisting in the capture of Camp Jackson, at the battle of Carthage, and at Wilson's Creek second in command under Gen. Lyon. In charge of a brigade he went through the s. Missouri campaign; was prominent in the battle of Pea Ridge; resigned in 1862; accepted a commission as maj. gen. a month later, and was placed in command of Harper's Ferry. A few months after, he took command of Fremont's army corps, served through the Virginia campaign and the second battle of Bull Run; commanded the dept. of West Virginia, 1864, was register of New York city 1871, and was prominent in politics in 1876; U. S. pension agent for N. Y., 1886-9.

SIGHING, THE ACT OF, is nothing more than a very long-drawn inspiration, in which a larger quantity of air than usual is made to enter the lungs. This is continually taking place to a moderate degree, and Dr. Carpenter remarks that it particularly occurs when the attention is released, after having been fixed upon an object which has strongly excited it, and which has prevented our feeling the insufficiency of the ordinary movements of respiration. Hence this action is often a simple result of deficient aëration; while in other cases, as is universally known, it is excited by a depressed state of the feelings.

SIGHT, DEFECTS OF. Under this head we shall consider such affections of the eye-sight as are due to some known or unknown peculiarity of the optical apparatus (including the optic nerve) not dependent on disease—viz., *short-sight, long-sight, double vision, color-blindness, and night-blindness.*

Short-sight, near-sight, or myopia (derived from the Greek words *myo*, I close, *ops*, the eye), is often popularly confounded with dim or weak sight; but in reality short-sight applies exclusively to the *range* and not to the *power* of sight, and a short-sighted person may possess the acutest power of vision for near objects. In this affection the rays which ought to come to a focus upon the retina converge to a point more or less in front of it. The cause of this defect probably differs in different persons. It may arise from over-convexity of the cornea or the lens, from undue density or abundance of the humors of the eye, from elongation of the globe in its antero-posterior diameter, or from an imperfect power of the eye to adjust itself to objects at various distances. The distance at which objects are perceived most distinctly by the perfectly normal eye ranges from 16 to 20 in.; an eye which cannot perceive objects distinctly beyond 10 in. may fairly be regarded as short-sighted; and in extreme cases the point of distinct vision may be 3, 2, or even only 1 in. from the eye. Short-sight is frequently hereditary in families. As a general rule the inhabitants of towns are much more liable to it than persons living in the country, and students and literary men are the most liable of all. While in the foot-guards, consisting of nearly 10,000 men, "not half a dozen men have been discharged, nor have a dozen recruits been rejected on account of this imperfection, in a space of 20 years, in one college at Oxford no less than 32 short-sighted men (or *myopes*, as they are termed by some oculists) were met with out of 127" (Donders, *On the Accommodation and Refraction of the Eye*, Lond. 1864, p. 342). The frequency of this affection in the cultivated ranks points directly to its principal cause—tension of the eyes for near objects. The myopia depending, as Donders believes, upon prolongation of the visual axis, this eminent physiologist inquires: "How is this prolongation to be explained? Three factors may here come under observation: 1. Pressure of the muscles on the eye-ball in strong convergence of the visual axis; 2. Increased pressure of the fluids resulting from accumulation of blood in the eyes in the stooping position; 3. Congestive processes in the base of the eye, which, leading to softening give rise to extension of the membranes. That in increased pressure the extension occurs principally at the posterior pole is explained by the want of support from the muscles of the eye at that part. Now, in connection with the causes mentioned, the injurious effect of fine work is, by imperfect illumination, still more increased; for thus it is rendered necessary that the work be brought closer to the eyes, and that the stooping position of the head, particularly in reading and writing, is also increased. Hence it is that in schools where, by bad light, the pupils read bad print in the evening, or write with pale ink, the foundation of myopia is mainly laid. On the contrary, in watchmakers, although they sit the whole day with a magnifying-glass in one eye, we observe no development of myopia, undoubtedly because they fix their work only with one eye, and therefore converge but little, and because they usually avoid a very stooping position."—*Op. cit.* pp. 343, 344.

So far from short-sightedness improving in advanced life, as is popularly believed, it is too frequently a progressive affection; and every progressive myopia is threatening with respect to the future. "If," says Donders, "it continues progressive, the eye will soon, with troublesome symptoms, become less available, and not unfrequently, at the

age of 50 or 60, if not much earlier, the power of vision is irrevocably lost, whether through separation of the retina from the choroid, from effusion of blood, or from atrophy and degeneration of the yellow spot."

In the treatment of myopia the principal objects are: 1. To prevent its further development and the occurrence of secondary disturbances; and 2. By means of suitable glasses, to render the use of the myopic eye easier and safer.

1. To effect, if possible, the first object, the patient must look much at a distance, but as we cannot absolutely forbid him looking at near objects, spectacles must be provided which render vision distinct at from 16 to 18 inches. Moreover, it is desirable that at intervals of a half hour work should be discontinued for a couple of minutes, and no working in a stooping position should be permitted. The patient should read with the book in the hand, and in writing should use a high and sloping desk.

2. The optical remedy for short-sight obviously consists in concave glasses of a focus suited to the individual case. At first sight it might be supposed that glasses with a concavity exactly sufficient to neutralize the defect in the eye would always suffice; and when the glasses are used exclusively for distant vision (for example, in the double eye-glass, which is only at intervals held before the eye), or when the affection is slight, and the eye is otherwise healthy, perfect neutralization is admissible; but so many circumstances forbid the complete neutralization of the myopia that an oculist of reputation should always, if possible, be consulted as to the choice of spectacles. Glasses, if injudiciously selected, usually aggravate the evil they are intended to remedy; and in connection with this subject may be mentioned the prevalent habit in foreign countries, of employing a single eye-glass; it is most prejudicial to the eye which is left unemploied, and often leads to its permanent injury.

Long-sight and presbyopia (derived from the Greek words *presbys*, an aged person, and *ops*, the eye) are usually considered by English writers as synonymous terms. Donders, who is now universally accepted as the highest authority on this department of eye-affections, maintains that "the term presbyopia is to be restricted to the condition in which, as the result of the increase of years, the range of accommodation is diminished, and the vision of near objects is interfered with." As from youth up to extreme old age, the vision of near objects becomes progressively more and more difficult, it is impossible to fix any limit as the commencement of presbyopia. In practice, however, a word is required which indicates the condition in which the eye, at an advanced period of life, and sometimes sooner, requires convex spectacles for distinct near vision, as, for example, for reading, and this word is *presbyopia*. In this state, the nearest point of distinct binocular vision is found to lie about 8 in. (or double the ordinary distance) from the eye, and at this point Donders arbitrarily places the commencement of presbyopia. This condition, which is as natural a concomitant of advanced life as gray hairs or wrinkles, is occasionally met with in young persons. In these cases, it generally arises from intestinal irritation, and may be a precursor of amaurosis; hence such cases should be carefully watched. In ordinary presbyopia, the defect is at once remedied by the use of glasses of low convex power, as of 30 or 24 in. focus, which should, however, only be worn during reading and writing, and not constantly. Although the improper use of convex glasses is not by any means so dangerous as the inconsiderate use of concave glasses, the advice of a good oculist regarding the choice of spectacles is well worth his fee.

Double vision, or diplopia, is of two kinds. It may arise from a want of harmony in the movements of the two eyes, the vision of each eye singly being perfect; or there may be double vision with one eye only. The first form may occur (1) in cases of squinting, or (2) in cases of paralysis of one or more of the muscles of the orbit. In cases of squinting (q.v.), the vision of the most distorted eye is almost always imperfect; and it is well known that impressions on the two retinæ are similar in kinds but dissimilar in form. The mind takes cognizance only of the former; so that a person with a bad squint sees objects with the sound eye only. But if the sight of both eyes is nearly equal, as often is the case when the squint is not very well marked, double vision results whenever both eyes are employed together, in consequence of images of nearly equal intensity falling on non-corresponding parts of the two retinæ. This variety of double vision, although annoying, is perfectly harmless. When double vision arises from muscular paralysis, disease of the brain of a serious nature is to be apprehended, although the affection sometimes appears to arise from exposure to cold. The second form of double vision—viz., double vision with a single eye—is a much more rare affection than the preceding one, and depends upon some irregular refraction of the cornea or lens.

Color-blindness is noticed under its own name.

Night-blindness, or hemeralopia (from the Greek, signifying "day-sight"), is a peculiar form of intermittent blindness, the subjects of which see perfectly with an ordinary light, but become entirely and almost instantaneously blind as soon as twilight commences. It is seldom met with in this country except among sailors just returned from tropical regions. It is frequent among the natives of some parts of India, who attribute it, as our own sailors do, to sleeping exposed to the moonbeams. The most probable cause of the affection is, however, exhaustion of the power of the retina from over-excitement from excessive light, so that this organ is rendered incapable of appreciating the weaker stimulating action of twilight or moonlight. All that suggests itself in the

way of treatment is to protect the eyes from strong light during the day, and to prescribe quinine and a nourishing mixed diet.

Snow-blindness must be regarded as an allied affection to the preceding.

SIGHT OF A GUN. See GUNNERY.

SIGILLARIA, a genus of fossil plants which are of importance because of their singular structure, and their remarkable abundance in the coal measures. They seem to have contributed more than any other genus of plants to the formation of coal. The roots of sigillaria are found preserved in the shale which forms the floor of all coal-seams. These roots were originally supposed to be distinct plants, and have received the generic name of stigmaria. The most feasible notion, and that generally accepted regarding them, was that they were fleshy water-plants, with numerous linear leaves, articulated to the stem by papillae, which were buried in deep cylindrical hollows in the stem. Brongniart first suspected that they were roots, and Binney placed the question beyond doubt by discovering a specimen in which the trunk of a sigillaria rose from the crown of a stigmaria. Several observers have subsequently seen these fossils also in actual contact. It is believed that the mud (now converted into shale) in which they grew was very soft, and easily permitted the passage of the large roots, while they gave off all around innumerable large hollow rootlets. The stems of sigillaria are abundant in the coal-beds. They are marked by parallel longitudinal flutings, and regular scars formed by the base of the leaf-stalks, which had fallen off. They are known to have attained a height of 70 ft. and a diameter of 5 feet. The stem rose without branching till near the summit, when it branched several times dichotomously. The proportion of woody matter to cellular tissue in the stem was very small. The woody fiber is characterized by the abundance of scalariform vessels, similar to those which occur in *lepidodendron*, and in the recent vascular cryptogamia. The stem is seldom found preserved so as to exhibit any structure, or even its cylindrical form; it generally occurs as a double layer of coal, showing on the outer surfaces the scars produced by the bases of the leaf-stalks. The form and arrangement of these scars have been used to distinguish the species, and, indeed, no other materials exist, for hitherto no foliage of any kind has been certainly found connected with the trunks. The restoration of the genus has been consequently quite imaginary. Some, with Brongniart, have supposed that the trunk terminated in a crown of simple leaves, like that of many palms, and that it was a gymnosperm near to the cycads. Others, with King, consider that the fronds of *pecopteris nervosa*, which are very abundant in the coal measures, are its foliage, and they would restore it so as to have the appearance of a modern tree fern. And others, with Binney, consider that its affinities are nearer to *lepidodendron*, and that some of the numerous fragments which have been referred to this genus may really be the branches of the sigillaria. They would restore it as if it were a huge *lycopodium*, and refer to it some of those fruits which, under the names of *lepidostrobus* and *flemingites*, have been described by Brown, Hooker, and Carruthers. See illus., COAL AND ROCK SALT, vol. IV.

SIGISMUND, Emperor of Germany (1411-37), was the son of the emperor Karl IV. He was well educated, and having married Maria of Anjou, on her accession to the throne of Hungary he became chief administrator of that kingdom. The death of his wife in 1392 made him king of Hungary; and at the head of a numerous army of more than 100,000 men, composed of Hungarians, French, Germans, and Poles, he attempted to relieve the Byzantine empire from the fierce Turks, but was terribly defeated at Nicopolis (Sept. 28, 1396). On his return to Hungary, he found on the throne a new monarch, Ladislas of Naples, who imprisoned him (1401); but through the good offices of his elder brother, Wenceslas, he was freed, and obtained the throne (1402), rewarding his elder brother by snatching from him his kingdom of Bohemia, which he retained for some time. In 1411 he was proclaimed emperor, on the death of Rupert. He was present at the council of Constance, which he had prevailed upon pope John XXIII. to hold for the purpose of putting an end to the Hussite and other schisms. He contented himself with protesting against the violation of the imperial safe-conduct which was given to Huss, and ultimately consented to his judicial murder, for the purpose, as his apologists say, of conciliating the council, and so settling the disputes concerning the papacy. His succession to the throne of Bohemia, after his brother's death, was opposed by the Hussites, who were now in insurrection; and after a fruitless attempt to conquer them, he confined himself to the defense of Hungary against the Turks, whom he defeated in a great battle near Nissa (1419). For ten years afterward, he left Germany very much to the guidance of its self-willed petty rulers, who speedily brought the country into such a deplorable state that they were glad to beseech Sigismund to return to the helm of affairs—which he did, but with little good effect. He obtained, by concessions to the Calixtines (q.v.), the crown of Bohemia in 1436; but once on the throne, he gradually withdrew these concessions, which provoked such discontent that his death (1437) alone averted a civil war. Sigismund possessed a large intelligence, and remarkable political talents, but these were much neutralized by his impetuosity, indecision, selfishness, and extraordinary avarice; and his well-meaning endeavors after peace and improvement ended in nothing. Carlyle distinguishes Sigismund by the epithet *supra grammaticam*, in allusion to his answer to a cardinal at the council of Constance, who

ventured to correct his majesty's grammar—"I am the Roman king, and above grammar."

SIGISMUND, worthily surnamed the GREAT, King of Poland, was the youngest son of Casimir IV., and was born at Koziénicé, 1467. He was chosen grand duke of Lithuania, 1506, and succeeded to the kingdom of Poland on Dec. 8 of the same year. The affairs of Poland and Lithuania were at that time in a sad condition; the southern portions of the country reduced almost to a desert by the ravages of the Tartars, while the east was continually in dread of the Russians, who had become an independent, united, and powerful monarchy. The Russians invaded Lithuania, and conquered some provinces, but Sigismund gained a brilliant victory over them at Orsza on the Dnieper (July 14, 1508). Bogdan, prince of Moldavia and Wallachia, now invaded the southern provinces, as that semi-barbarous race were accustomed to do without let or hindrance; but he was so decisively routed on the banks of the Dniester, that he gladly agreed to acknowledge himself a vassal of Poland. Disregarding the suggestions of the pope to head a crusade against the Turks, Sigismund next read the Tartars, through his gen., Ostrogski, a very forcible lesson, in 1512, against aggressive practices, which cost them 27,000 men, and assured the tranquillity of his frontier for a long period. His alliance in 1513 with Stephen Zapoli, voyvode of Transylvania, whose daughter, Barbara, he also married, alarmed the emperor Maximilian, who incited the Russians to resume their aggressions, which that ill-advised nation cheerfully agreed to do; paying dearly for their rashness, for their army of 80,000, which had invaded Lithuania, was met and cut to pieces (Sept. 8, 1514) by Ostrogski, with 32,000 men, at Orsza, leaving its standards, cannons, and other arms, 2 generals, 37 princes, 6,000 prisoners, and 30,000 dead in the possession of the enemy. Subsequent invasions of Moscovites and Tartars were repelled as before, and a rebellion of the Wallachs was punished by numerous defeats, chief of which was that of Obertyn (1531). The insolence of the Teutonic order, who had invaded Polish Prussia, was effectually chastised by Sigismund, who defeated their grand master Albert, his own nephew, in two great battles, in the latter of which the knights were assisted by the Danes (1520). In 1525 he agreed to confer on Albert the title of duke of Prussia (now known as East Prussia), on condition of fealty and homage. The dukes of Prussia continued as vassals of the Polish crown till 1657. In 1526 Sigismund alone of the monarchs of Christendom lent aid to Hungary against the formidable array of Solymán the magnificent, and a numerous force of Polish cavaliers fought bravely on the fatal field of Mohacz (1526). The only other important event of Sigismund's reign was the introduction and extension of Lutheranism in Poland, a change which Sigismund did nothing to prevent, only taking precautions, and sometimes severe ones, against its affecting the civil and political condition of the country. It is told of him that, when John Eck exhorted him to take severe measures with the Lutherans, whom he compared to goats among the sheep ("the faithful Catholics"), Sigismund replied that he was desirous of being "king of goats as well as king of sheep." After a long and glorious reign, Sigismund died at Cracow, April 1, 1548, leaving the character of a just, wise, and magnanimous prince, who had restored to his country its ancient prosperity, and had raised it from the very feet of its enemies to a worthy superiority over them.

SIGMARINGEN. See HOHENZOLLERN.

SIGNALS are the means of transmitting intelligence to a greater or less distance by the agency of sight or hearing. Incomparably the most powerful medium yet known for this purpose is the electric current. See TELEGRAPH. Sound signals have obviously but a short circuit. The electric current requires fixed apparatus establishing an actual communication between the two points; and is therefore inapplicable to the ordinary cases of ships interchanging signals with each other or with the shore; and, except under unusual circumstances, it would not apply to armies maneuvering in the field. For these purposes, so far as present knowledge extends, signals by sight or sound must always be the resort. For railway signals, see RAILWAYS.

The ancients seem to have elaborated a fair system of night-signals by torches for military purposes; but in naval affairs the ships sailed so close together that orders could be communicated by word of mouth, while the turning of a shield from right to left sufficed as sailing directions to the several lines. In modern times signaling between ships has become indispensable; but there is probably no department of practical science in which progress has been slower, and every so-called system of signals has been distinctly without any system whatever. In the time of James II. a signal could only be expressed by flags, in confusing number, hung in different parts of the vessel. By the commencement of the present century, thanks to sir Home Popham and other inventors, the system had been adopted of hanging a number of flags under one another, each symbol or combination having an arbitrary conventional meaning attached to it. Alterations in the specific flags have been made from time to time, but essentially this is the system now in use. The flags are either square, triangular of the same length, or pendants which are pointed and longer. These are of black, white, red, blue, and yellow (in the Austrian service alone green is added) in mass or in combination. Specimens of the flags in use in the present naval code are shown in Fig. 1. The signalmen find, how-

ever, that at a distance blue, red, and black are

Fig. 1.

the case is otherwise on shore, and it may consequently occur that the ship can communicate to the land, but cannot get a reply. To obviate this signals representing solid figures are sometimes employed. To fulfill their conditions they must appear the same in whatever lateral direction seen. But this limits the shapes to cylinders, cones, and the sphere, or combinations of those figures; and as the total number of distinguishable signs is reduced, signaling becomes reduced from the word-signal to the telegraph. This distinction should be clearly understood, as much is involved in it. A word signal, as in the present system, is where the whole word or message is sent up at once, and flies simultaneously; a telegraph signal is one in which the letters composing the word or numbers representing the signal are shown separately, and each is removed before another is shown. At sea the word-system is best, for it involves no act of memory; and memory, even from signal to signal, is found difficult by signalmen in the turmoil of perhaps storm or fighting. On the other hand, the telegraph system involves far simpler apparatus, and the changes can be effected more rapidly. As regards the actual time required for a message, the word-system has the advantage in a message short enough for the whole to be shown at one time; but otherwise the difference is not material. If all advantages be balanced, it is probable that the telegraph system will eventually supersede the other entirely. Whether the word or the telegraph system be practiced, another question is, whether to spell each word, or to use numerals and a code. Under the latter principle about 14,000 of the words and sentences most commonly sent are arranged for easy reference in the signal-book. With the addition of 1 or 2 repeating symbols the 9 numerals and 0 give combinations 4 together to this number. A combination of figures is arbitrarily assigned to each expression; and the expression is communicated by representing those figures in their proper order. With the book of reference at hand, and intelligent signalmen, there can be no doubt of the superior rapidity of the "code." A code has also this further advantage, that, the signals representing things and not words, it can be made international, the same symbols representing the same idea in every language. It is then only necessary for universal signaling that each nation should concur in the meaning to be attached to the several signs. Many gentlemen of ability have devoted their attention of late years to the simplification of signals; among whom conspicuous positions must be assigned to Col. Grant, Col. Bolton, Mr. Redl, and Capt. Colomb, R.N. Their principal object has been so to simplify the telegraph system that signals may be made with any apparatus, or without apparatus at all. To accomplish this they have, to a great extent, abjured color and resorted to form and motion. Among the form telegraphs there is the principle of the old semaphore (q. v.), in which each letter or number is shown by the position of two arms, as in Fig. 2. The arms are heavy, and involve mechanism; besides which they are not always clear on a ship in motion beyond a short distance. Very superior in visibility and simplicity is Redl's system of cones. This consists of 4 cones fixed to a mast. The cones are collapsible, and are formed in a similar manner to umbrellas. Their usual condition is shut, and they can only be held open while a rope attached to each is pulled. With cones of 3 ft. base, signaling is rapid and clear up to 5 m., and the mast can be inserted at any place. The system is very simple: each cone represents a number, 1, 2, 3, or 4; then 1 and 4 shown represent 5; 2 and 4, 6; and so on, as in Fig. 3. This very elegant system can be applied in military or naval operations. But its chief beauty is that a person understanding it can make the same signals without the cones; for example, if a black flag represent an open cone, and a white flag a shut cone, a ship with 4 black and 3 white flags can make every signal. Again, the arm raised horizontally may represent the open cone; against the body, the shut cone; then two men standing on a cliff are as good as any signal-post—see Fig. 4. Or if one person only be present, he may represent an open cone by raising his arm with a handkerchief extended, and a shut cone by his arm without the handkerchief. He has only then to raise his arm four times in quick succession, with or without the handkerchief, to make the required signal. We have thus arrived at a universal system of the utmost simplicity, which in war, and especially during invasion, might be of inestimable benefit to the nation. The code of signals cannot be too generally diffused by the government, in order that every man among the

not readily distinguishable, nor yellow from white. It has consequently been the recent tendency, and apparently most justly, to reduce all the signs to black and white, singly or in combination, trusting to shape for different signals.

There are, however, disadvantages attending flags. In a still day they are difficult to read; or the wind may so blow that they are only seen end on. At sea the motion of a ship will generally neutralize these drawbacks; but

Fig. 2.—Semaphore Sytem.

public may become an amateur signalman on emergency. A secret code, in which the same numbers have different significations, could always be maintained for state purposes.

It only remains to apply the same system to night-signals. The old naval principle has been to hang dingy lanterns in various shapes—triangles, squares, crosses, etc. Besides requiring large bases to be at all visible, this has been found from the motion of a ship to be nearly useless. Redl's system has been applied by hanging four lanterns in

FIG. 3.—Cone System.

FIG. 4.

a vertical line to represent the cones, and obscuring those which corresponded to shut cones. An improvement was found in introducing a red or green light in the middle, to show the relative position of the four. The best night-signals are, however, flashing lights, as introduced by Col. Bolton, and more elaborately by Capt. Colomb, and adopted in the navy. This consists of a bright light, covered by a shade, which shade, by mechanism, can be lifted for any given time, exposing the light meanwhile. A flash of about half a second's duration is negative: a line of $1\frac{1}{2}$ seconds, positive. Four exhibitions of the light then represent a symbol as in Redl's cones. If the same nomenclature be adopted we should signal as in Fig. 5. It will be seen at once that this system produces results similar to Morse's electric telegraph. If the distance be within a mile or so, and the weather still, a bugle will answer equally well, long and short notes representing the positive and negative cones.

FIG. 5.

The fundamental principle of the foregoing system of universal telegraphy, applicable by night or by day, by sight or by sound, is to employ two signals only—one positive and one negative—and to regulate their exhibition by periods of time. See HELIOGRAPHY.

SIGNALS, AUTOMATIC RAILWAY. Various appliances have been invented for signaling the movement of trains and the position of switches. The Ducousso brothers have an invention, which gives notice of the passing of a train along certain parts of the line. The transmitter is a magneto-electric generator of induction currents, and the passage of a train induces a current which rings a bell at the receiving station. Another invention, by Coupan, signals the station man, if the lights at the switches are not burning and in proper position. When switches are moved by levers in a tower, at some distance from the place of the switch, they may not always respond to the movement of the lever; Lartigue has invented a signal for notifying the switchman if the switch does not respond. All signals, to be of value, must be given far enough ahead of the danger spot to stop the train. In the block system when a train enters a section, it sets a danger signal, and resets it at safety when leaving the section. Automatic signals are connected with switches, so as to set a danger signal when the switch is open, and by the passage of a current they may be made to give notice of a broken rail.

SIGNAL SERVICE OF THE UNITED STATES. At the time of the organization of the department of meteorology of the army signal office (see METEOROLOGY) there was no general system in operation for "simultaneous meteorology," and the one ever since in use was devised and carried into effect by Gen. Myer (q.v.), chief signal officer. By this system the innovation was introduced of observing and reading off the instruments, "at the same moment of actual (not local) time." By this arrangement the signal office at Washington can call for and receive reports from all parts of the country, taken at each of the stations, at any hour of the day or night. Thus, the exact condition of the atmosphere over the whole field of inquiry is set down at a given instant, establishing the existence of conditions on which predictions may be and are fearlessly made. In Nov., 1871, a comparison of the tri-daily forecasts, or "probabilities," as they were styled, showed a verification of 69 per cent, which rose to 76.8 per cent by 1872. These results "afforded the best elucidation and the most complete demonstration of the law of storms and the movements of cyclones that had ever been obtained in any country." In 1872 and 1873 the expansion of the work of the signal office was very great; extending, through the cordial aid of agricultural societies, into a comprehensive weather-bureau sustained in the interest of agriculture; and, through its connection with life-

saving and signal stations, becoming a most certain and effective agent for saving life and property endangered by storms on the sea. "Indication" and "cautionary signals," based upon three series of simultaneous weather-reports telegraphed to Washington daily, are issued from the office of the chief signal officer three times each day, and are printed in all newspapers where it may be important to do so, and otherwise made public. The preparation of a graphic weather-map embodying the telegraphic data furnished to the chief signal officer every eight hours, preserves an accurate picture of existing aerial phenomena, and the conditions on which storm predictions are made. The "Farmers' Bulletins" are reprinted by signal-service observers in 19 cities, and the telegraphic forecasts are circulated among 6,042 sub-centers in agricultural communities, and thence distributed among the farmers. As the predictions cover twenty-four hours, and often hold good for twice that period, they reach the denser rural populations sometimes a day and a half and always as much as fourteen hours before the period to which they apply expires. The railroad system has co-operated in this service, and 103 railway companies distribute daily 3,180 reports to as many railway stations, without charge.

On March 1, 1887, a new system of weather signals was introduced by the United States Signal Office of the War Department, and has since been in use at all the stations of the service. The flags adopted for this purpose are four in number, and of the form and dimensions indicated below:

No. 1.
White Flag.

Clear or fair weather.

No. 2.
Blue Flag.

Rain or snow.

No. 3.
Black Triangular Flag.

Temperature signal.

No. 4.
White Flag with black square in centre.

Cold wave.

Number 1, white flag, six feet square, indicates clear or fair weather. Number 2, blue flag, six feet square, indicates rain or snow. Number 3, black triangular flag, four feet at the base and six feet in length, always refers to temperature; when placed above numbers 1 or 2 it indicates warmer weather; when placed below numbers 1 or 2 it indicates colder weather; when not displayed, the indications are that the temperature will remain stationary, or that the change in temperature will not vary more than 4° from the temperature of the same hour of the preceding day, from March to October inclusive, and not more than 6° for the remaining months of the year. Number 4, white flag, six feet square, with black square in centre, indicates the approach of a *sudden and decided* fall in temperature. This signal is not to be displayed unless it is expected that the temperature will fall to 42° or lower, and is usually ordered at least twenty-four hours in advance of the cold wave. When Number 4 is displayed, Number 3 is always omitted.

EXAMPLE.

Cold wave,
followed by
rain or snow,
succeeded by
fair weather.

When displayed on poles, the signals are arranged to read downward; when displayed from horizontal supports, a small streamer is attached to indicate the point from which the signals are to be read.

INTERPRETATION OF DISPLAYS.

- No. 1, alone, indicates fair weather, stationary temperature.
- No. 2, alone, indicates rain or snow, stationary temperature.
- No. 1, with No. 3 below it, indicates fair weather, colder.
- No. 2, with No. 3 above it, indicates warmer weather, rain or snow.
- No. 1, with No. 4 below it, indicates fair weather, cold wave.
- No. 3, with Nos. 1 and 2 below it, indicates warmer, fair weather, followed by rain or snow.

EXAMPLE.

Warmer,
fair weather,
followed by
rain or snow.

STORM, CAUTIONARY, AND WIND-DIRECTION SIGNALS.

Red, Black Centre. Yellow, White Centre.

Storm.

Cautionary.

Red Pennant.

Easterly winds.

White Pennant.

Westerly winds.

A red flag with a black centre indicates that the storm is expected to be of marked violence. A yellow flag with a white centre indicates that the winds expected will not be so severe, but well-found, seaworthy vessels can meet them without danger. The red pennant indicates easterly winds; that is, from the northeast to *south* inclusive, and that generally the storm-centre is approaching. If *above* cautionary or storm-signal, winds from northeast quadrant are more probable; *below*, winds from southeast quadrant. The white pennant indicates westerly winds; that is, from *north* to southwest inclusive, and that generally the storm centre has passed. If *above* cautionary or storm signal, winds from northwest quadrant are more probable; if *below*, winds from south-west quadrant. By night a red light will indicate easterly winds, and a white light above a red light will indicate westerly winds. In July, 1891, the Signal Service passed under the control of the Department of Agriculture.

SIGNATURE, in music. In writing music in any key with sharps or flats, the sharps and flats belonging to the key, instead of being prefixed to each note as required, are placed together immediately after the clef on the degrees of the staff to which they belong; and this collection of sharps or flats is called the signature. The signatures of the several keys generally in use are as follows:

MAJOR.

MINOR.

E B F# C# G# D#

MAJOR.

MINOR.

D G C F Bb Eb

The minor keys take the same signature with the major keys a third above them.

When a new key is introduced in the middle of a piece of music, the signature of the former key must be contradicted, and that of the new one appended. Thus a transition

from the key of D major to that of D minor is indicated thus: ; from B

major to B minor: ; the sharps which are to continue being, in this

last case, for distinctness' sake, appended in addition to the contradiction of those that are to be discarded. A transition to another key, which is not to continue for any length of time, is seldom indicated by a change of signature; but the sharp, flat, or natural sign is appended to any note as required, that sign affecting all the following notes of the same letter in the measure in which it occurs, unless contradicted. A sharp, flat, or natural thus introduced is called an accidental. Two accidentals are required in the ascending scale of every minor key, to sharpen the sixth and seventh of the tonic.

Besides the signature of the key, a signature of time precedes every musical composition. It consists of two figures placed over one another as a fraction, the denominator 2, 4, 8, or 16 standing for minims, crotchets, quavers, or semiquavers (i.e., halves, fourths, etc., of a semibreve), while the numerator points out how many of these fractional parts

of a semibreve are contained in each measure. Thus, $\frac{2}{4}$ indicates that there are two

crotchets, and $\frac{3}{8}$ three quavers in the measure. When there are four crotchets (or

a semibreve) in the measure, it is usual to write $\frac{4}{4}$ instead of $\frac{4}{4}$.

SIGNATURE, in printing, denotes the letters which are placed at the bottom of the first page of each sheet of a book, to facilitate the arrangement of the several sheets in the volume. The letters employed are those of the alphabet with the exception of J, V, and W, three letters which have been invented since the use of signatures was introduced. See ALPHABET. As the first sheet of a work, containing the title-page, dedication, preface, etc., is generally printed last, the letter A is reserved (along with small letters, a, b, etc., should there be more sheets of introductory matter) for this, and the signatures commence with B; after reaching Z they commence again at the beginning of the alphabet, the letter being doubled for the sake of distinction, as AA, or Aa, or more frequently 2A. Should the alphabet again be exhausted, 3A, 3B, etc., are next employed, and so on. This is the method employed in Britain; in France and

Italy, figures are generally used. Signatures (as B2, B3, etc.) are also placed on certain pages of the same sheet, as a further direction to the book-binder.

SIGNET, in England, one of the seals for the authentication of royal grants. Prior to 1848 all letters-patent and other documents which had to pass the privy seal required first to have the signet affixed, and passed from the signet-office to the office of the privy seal in the form of signet bills, verified by the signet-seal and superscription and the signature of the clerk of the signet. By act 11 and 12 Vict. c. 82, however, warrants under the royal sign-manual, countersigned by one of the principal secretaries of state, have been made *per se* sufficient authority for the privy seal to be affixed, and the signet-office has been abolished. The signet in Scotland is a seal which seems to have been originally intended to authenticate royal warrants connected with the administration of justice. The principal class of agents or attorneys in Scotland are called writers to the signet, it is said from their having been originally clerks in the office of the secretary of state, by whom writs passing the signet were prepared. See **WRITERS TO THE SIGNET**.

SIGNING, SEALING, and DELIVERY of a deed, in English law, is the mode of executing a deed. The main acts are, however, the sealing and delivery, for signature is not absolutely essential—at least in some kinds of deeds known to English law. The use of the seal is an ancient form of authenticating deeds, still kept up in England, though long superseded in Scotland by simple subscription. In practice, a wafer or seal is attached to the end of the English deed, and the party who executes it must, after signature, put his finger on the seal, and say: "I deliver this as my act and deed," at the same time handing the deed to the person who is to have the custody thereof.

SIGN-MANUAL, ROYAL, the subscription of the sovereign, which must be adhibited to all writs which have to pass the privy seal or great seal. When attached to a grant or warrant, it must be countersigned by one of the principal secretaries of state, or by the lords of the treasury. The sign-manual, in practice, consists but of the initial of the sovereign's name, with the letter R added, for *Rex* or *Regina*.

SIGOURNEY, MRS. LYDIA HUNTLEY (Huntley being her maiden name), American authoress and poet, was b. at Norwich, Conn., in 1791. She was, like most young ladies of ability in New England at that period, early engaged in teaching, and much of her early writings consist of tales, essays, instructive letters, and poems, for her pupils and the young. Her first published work was a volume of poems in 1815. In 1819 she was married to Mr. Charles Sigourney, a merchant of Hartford. In 1822 she published a descriptive poem on the *Traits of the Aborigines of America*; and in 1824 a *Sketch of Connecticut Forty Years Since*. These were followed by *Pocahontas and other Poems*; *Lays of the Heart*, *Tales in Prose and Verse*, etc. In 1840 Mrs. Sigourney visited Europe, and on her return, with a freedom common to American authors, wrote her *Pleasant Memories of Pleasant Lands*. She compiled amusing and instructive books for the young, and was a constant contributor to magazines and other periodicals of poems, whose subjects, style, and sentiment gave her the designation of "the American Hemans." She died at Hartford, June, 1865.

SIHUN. See JAXARTES.

SIKHS. The term Sikh, a corruption of the Sanskrit *śiṣya*, signifying "disciple," is applied to a community of which the Punjab, in northern India, constitutes, substantially, the confines. Less commonly, even among themselves, the members of this community are also known as Sinhs (vulgarly Singhs), that is, "lions," a title given them by Govind, the last and most influential of their hierarchs. Every name of a Sikh male now terminates with the word Sinh.

Originally a body of mere religionists, the Sikhs, what from the energy which they developed under repression, and the inducements to join them which they offered as proselytizers, grew, by degrees, in strength and numbers, and ended in a formidable nationality. Their originator, Nānak, was born in 1469, in the vicinity of Lahore, and died in 1539, not far from the place of his nativity. To him succeeded, in turn, nine pontiffs, each of whom, like himself, is popularly denominated guru, or "teacher." These were Angad, Amardās, Rāmdās, Arjunmall, Hargovind, Harrāy, Harkrishna, Teghbahādar, and, finally, Govind.

The aim of Nānak was pointedly humanitarian, and designed to combine Hindus and Mohammedans, at the cost of what he held to be only unimportant compromise, into one harmonious brotherhood. Sufficient proof of the comprehensive character of his scheme is afforded by the circumstance that he accepted concurrently the incarnations of Neo-Brahmanism and the mission of the Arabian prophet. His three immediate successors, while zealously protecting the interests of the infant sect, avoided secular pursuits, and held themselves aloof from political complications. Arjunmall, however, not content with signalizing himself as compiler of the *Adigranth*, and as founder of Amritsar, the holy city of the Sikhs, engaged with ardor in trade, and rendered himself conspicuous as a partisan of the rebellious prince Khusrū, son of Jahāngir. Hargovind, who came after Arjunmall, called the Sikhs to arms, led them in person to battle, and though he remitted nothing of his assiduity as a guru, became an active and useful, though sometimes refractory, adherent of the Great Mogul, against whom his predecessor had plotted. Harrāy subsequently espoused the part of Dārā Shukoh, when con-

tending with his brothers for the throne of India. Harkrishna, son of Harrây, died a child, and was only nominally a guru. Teghbahâdar, after a career of turbulence, was executed as a rebel, by command of Aurangzeb, at Delhi. However deficient in the qualifications demanded for spiritual leadership, it can scarcely be doubted that he contributed, to an important degree, in preparing for the complete change of Sikhism which was affected by his son, Govind. The chief motive that instigated Govind, the tenth of the "teachers," to bring about this change was, with some probability, a desire to avenge the ignominious death of his father. He resolved to combat the Mohammedan power and, in deviation from the principles enunciated by Nānak, the Mohammedan religion as well. But Hinduism, with its social restrictions of caste, its fantastic fictions, and its irrational idolatry, likewise fell under his ban. God, he inculcated, is not to be found save in humility and sincerity. In what measure he was a man of thought is evinced by his legacy to his co-religionists, the second volume of the Sikh scriptures. A Sikh, it is therein taught, is to worship one God, to eschew superstition, and to practice strict morality, but equally is to live by the sword. The purport of this last injunction is unmistakable. Govind was assassinated, while in the imperial service, in 1708, on the banks of the Godāvari. He died, it is true, without beholding the fulfillment of the purpose for which he had striven; but he had, nevertheless, succeeded in stirring his followers to an ambition for political independence—an idea which was ultimately transformed into a reality. His successor, but only as a temporal leader, Banda, suffered a cruel death. He did but little to advantage his sect; and his memory is not held in reverence.

With the decline of the Moghul empire, the might of the Sikhs, in spite of their intermittent reverses, steadily increased, until, in 1764, they convened a general assembly, formally assumed the character of a substantive nation, and issued coin from which the name of the emperor was omitted. Their commonwealth was still denominated, as it had been by Govind, Khālsa; and the component states of the federation, ordinarily said to have been twelve in number, were thenceforward distinguished as Mislis. Foremost in influence among these states was that of Sukarchakīyā, the chieftain of which was Mahā Sinh, for whose son, the famous Ranjit Sinh (Runjeet-Singh, q.v.), it was reserved to consolidate the Mislis into a unity subject to his own undivided control. The virtual headship of Ranjit Sinh dates from the year 1805, though it was not until 1838 that he attained the zenith of his ascendancy. He died in the year following, at the age of 59. During 1845 and 1846 the Sikhs ceased to exist as a nation; and their country has since been ruled by the English. Yet every loyal Sikh is still confident that his people is suffering but a transitory depression, and that it is destined to retrieve, and even to surpass, its bygone glory. In the meantime, the reputed son of a wife or concubine of Ranjit Sinh, Dilip Sinh, is a pensioner of the British government, has professed Christianity, and has taken up his abode in England.

Ethnologically considered, the Sikhs are, in large proportion, of Jât origin; the Jâts, whom some take to be one with the classical Getae, being a tribe extensively diffused over the n. of India. But other Hindus have helped to swell their ranks, and also not a few Mohammedans. The ten gurus are accounted Kshatriyas, or of the second Brahmanical caste, the martial. The descendants of these several races, from intermarriage and other causes, cannot, however, now be discriminated; and there is no division of the multimorph population of India that strikes more than the Sikhs, as respects physical uniformity. For symmetry and comeliness, and, it may be added, for courage and powers of endurance, the Lions of the Punjab are altogether remarkable.

Nānak's was, undoubtedly, by far the most successful of the repeated attempts which have been made to fuse together the incompatible dogmas of Hinduism and Islamism. None of the authors of these attempts seem, indeed, to have been acquainted with other than the mere surface of the two religions which they would have blended into one. With the Mohammedan, the existence of the Deity as a pure spirit, and his creatorship of the world, are fundamental postulates. On the other hand, the radical doctrine of the Hindu is pantheism, agreeably to which the universe, alternatively God, is a single eternal substance, under the twofold aspect of spirit and matter. These sets of first principles, which Nānak and his fellow-reformers could never have clearly apprehended, are palpably impossible of reconciliation. Without rejecting all that is distinctive of his creed, no Hindu can assent to the theology of Islam; and, conversely, every intelligent follower of the Arabian prophet must be aware that the monism and metempsychosis of Brahmanism are utterly antagonistic to the leading positions of his own faith. Govind, as we have seen, openly repudiated the notion of amalgamating Hinduism and Mohammedanism. An opportunity of becoming acquainted with his real views and those of Nānak in their fullness has been provided for English readers by Dr. Trumpp's translation (London, 1877) of the *Adigranth* (the Original Record). The *Granth* contains also extensive quotations from Kubir and other predecessors of Nānak. A second *Granth*, by Guru Govind Sinh, has not yet been translated. These voluminous compositions are metrical throughout, and are in an archaic Indian vernacular, older than Hindi and Panjabi. They are written in the same character as the Sanskrit, the values of the letters being altered, though their forms are retained.

Among the numerous divisions into which Sikhism, as a system of belief and practice, has ramified, two at least, apart from the great central sect, deserve specification.

First are the Udâsis, professors of indifference to mundane concerns; a sect whose origin is attributed to S'richand, a son of Nānak. These recluses, whom Amardās refused to recognize as genuine Sikhs, have, to this day, numerous disciples. The Akālīs sprang up just after the time of Govind. For extravagance of fanaticism, these Ishmaelites have, it is hoped, no rivals; and the style of their piety is comparable with that of a Thug.

As specimens of the superstitions of the Sikhs, it may be noted that, like the Hindus, they look upon the eating of beef as a deadly offense, and that, like the modern followers of Zoroaster, they attach sinfulness to the act of extinguishing a light with the breath. Some illustrations of practical Sikhism may also be gathered even from the few remarks that have been made touching the gurus. It is not irrelevant to add, that Amardās humanely discountenanced the cremation of widows, and that Arjunmall committed suicide. The morality of ordinary Sikhs is as positively maintained by one class of writers as it is denied by another. Evidence should seem to show that the agriculturists among them are much on a par, as to correctness of life, with other Indian cultivators of the soil. As to their soldiers, however, it has been observed that they are deeply tainted with those repulsive impurities for which the Persians are so infamous. Though forbidden the use of tobacco, they are under no restriction as concerns indulgence in bhang, opium, and intoxicating drinks; and it would be gross flattery to commend them on the score of sobriety. As regards morality, there is reason to believe that they have greatly degenerated since the days of Govind.

The gross Sikh population has been most variously estimated by different statisticians, some of whom compute it at considerably less than half a million of persons, while others deem a million and a quarter, or even a million and a half, to be not excessive.

For the most satisfactory extant treatment of the subject of this article, the reader is referred to Capt. J. D. Cunningham's *History of the Sikhs*. Sir J. Malcolm's *Sketch of the Sikhs; The Asiatic Researches*, vols. i. and xi.; the collective works of prof. H. H. Wilson, vols. i. and ii.; and *The Calcutta Review*, vols. xxxi. and xxxiii., may likewise be consulted with advantage. See Trumpp's *Die Religion der Sikhs* (1881).

SIKH WARS, two brief but desperate contests waged between the British power in India and the Sikhs in 1845-46, 1848-49, which resulted in the destruction of the latter as an independent nation. The first had its origin in the dissensions which convulsed the Sikh country after the death of Runjeet Singh (q.v.), and which necessitated the exercise of a wary regard on the part of the Calcutta authorities. At length an army of Sikhs, flushed with their triumph over all lawful authority in their own country, crossed the Sutlej, and extended their ravages over British territory; but their advanced guard was met by sir Henry Hardinge, the governor-general, at the head of four regiments of infantry and one of dragoons, and routed at Mudki (q.v.) with heavy loss. Three days after, their main body, which had meantime crossed the river, and intrenched itself at Feroze-Shah (q.v.), was attacked by a larger force of British under Gough and Hardinge, and after a bloody conflict, which lasted two days, also routed. Still undismayed by these reverses, they again intrenched themselves at Sobraon; but a fresh body which had just crossed the Sutlej at Aliwal (q.v.), 19,000 strong, with 68 pieces of cannon, was wholly routed and driven across the river by sir Harry Smith, at the head of 7,000 men, with 32 guns; and their main body was soon after similarly dispersed at Sobraon (q.v.). The British then crossed the river, took Lahore, and restored the authority of the young maharajah, from whom they took the territory between the Beas and the Sutlej, the treaty confirming this settlement being made at Lahore, Mar. 9, 1846. But the internal disturbances in the kingdom of Lahore soon became as active as before, and induced the maharajah's prime-minister to put the country under the company's protection; and a residency with a guard of regular troops was then established in the capital. On April 20, 1848, two British officers were murdered by a Sikh chief, the Dewan Moolraj of Multan; and as this was found to be but a premonitory symptom of a general outbreak, a small force of British under lieut. Edwardes, aided by a body of Sikhs, under the rajah of Bhawalpur, gallantly attacked the army of Moolraj, which, after a desperate conflict of 9 hours, they defeated on June 18, and both sides in the mean time having received re-enforcements, again on July 1. Multan was then laid siege to, but the defection of 5,000 auxiliary Sikhs under Shere Singh (the son of the Sirdar Chuttur Singh, the governor of Hazara, who had been for some time in revolt, and had driven the British from his district) compelled the British to retreat. For some time the British authorities in the Punjab were hampered by a want of military force, and though the maharajah and much of his army still opposed the Sikh rebels, little reliance could be placed upon most of it. Shere Singh now succeeded in raising his army to 40,000, but was defeated by lord Gough at Ramnugger (Nov. 22). The inconsiderate haste of Gough at Chillianwalla (Jan. 13) nearly lost him that great battle, which was saved only by the extreme valor of his soldiers; but amends for this fault was made at Guzerat (q.v.), where the power of Shere Singh and his allies was completely broken. Meanwhile, the fortress of Multan had, after a protracted bombardment, been captured; and the Company, seeing no other mode of protecting their territories from annoyance by these warlike, fanatics, annexed the Punjab, Mar. 29, 1849, thus terminating the existence of the Sikhs as an independent nation.

SI-KIANG', or **WESTERN RIVER**, a river at the southern extremity of China proper. It has lately been ascertained by our surveyors to be navigable for vessels not drawing more than 16 ft. of water for about 100 m. from its mouth. The Si-kiang is remarkable for the purity and clearness of its waters. It is at present chiefly useful in conveying the sugar-cane that grows in its vicinity, as well as rafts of timber from the forests of Kwangse to the markets of Canton.

SIK KIM, a small protected state in the n.e. of India, bounded on the w. by Nepaul, and on the s.e. by Bhotan. Area, 2600 sq.m.; pop. '91, 30,458.

SILENÉ, a genus of plants of the natural order *caryophyllaceæ*; with a tubular 5-toothed calyx; 5-notched or bifid petals, which terminate in a narrow claw at the base, spring from the stalk of the germen, and have each an appendage forming a *corona* (q.v.) in the mouth of the corolla; 10 stamens; 3 styles; the capsule 3-celled, 6-toothed, many-seeded. The species are numerous, mostly natives of the temperate parts of the northern hemisphere, annual and perennial plants; nine or ten of them natives of Britain, and others frequent in flower-gardens.—One of the most common British species is the **BLADDER CAMPION** (*S. inflata*), a perennial, which grows in corn-fields and dry pastures, and near the sea-shore, has a branched stem fully a foot high, ovate-lanceolate bluish-green leaves, panicles of white flowers, and an inflated calyx, with a beautiful network of veins. The young shoots are sometimes used like asparagus, and have a peculiar but agreeable flavor, somewhat resembling that of peas. They are best when most blanched. The cultivation of this plant was long ago strongly recommended, but it has not obtained a place among garden plants.—The **MOSS CAMPION** (*S. acaulis*) is a pretty little plant, with beautiful purple flowers growing in patches so as to form a kind of turf, one of the finest ornaments of the higher mountains of Scotland, and found also in Cumberland and Wales.—Many species, some of them British, are popularly called **CATCHFLY**, from their viscidty, as *S. Anglica*, a species found in sandy and gravelly fields in many parts of Britain.

SILENUS, son of Pan and Gæa (the earth), is generally represented as the chief of the Sileni or older Satyrs (q.v.), and the inseparable companion of Bacchus, with whom he took part in the contest against the Gigantes, slaying Enceladus. In most respects he seems to have resembled the other satyrs, and to have borne a strong likeness to sir J. Falstaff, being in addition noted for his wisdom and his power of prophecy. Silenus had a temple at Elis. See illus., **MYTHOLOGY**, vol. X.

SILE SIA, a province of the kingdom of Prussia, included in the limits of the German empire, lies s. of the provinces of Brandenburg and Posen, and is bounded on the e. by the Polish provinces of Russia and Austria, and on the s. and w. by the Austrian provinces of Silesia and Bohemia, and the kingdom of Saxony. It is divided into three governments: *Liegnitz*, in the w.; *Breslau*, in the e.; and *Oppeln*, in the s.; and these, again, are subdivided into circles. Area, 15,563 English sq. m.; population, 1895, 4,415,309, of whom 1,974,629 were Lutherans, 2,384,754 Catholics, and 47,593 Jews. The majority of the inhabitants speak the German language, but Polish is spoken by about 1,000,000, and there are a number of Slavic dialects. This province, the largest in size and second in population of the Prussian provinces, is crossed from n.e. to s.w. by a broad strip of mountainous country, which widens out at each extremity; and along the whole eastern boundary, and in the s. are ranges of low hills; in the n.w. and center the surface is flat and heathy, or sandy, with numerous stagnant pools. Silesia is almost wholly included in the basin of the Oder (navigable as far s. as Ratibor), which flows through it from s.e. to n.w., and receives from each side numerous tributaries; but a small portion in the extreme s. is drained into the Vistula, which here takes its rise. The soil is altogether fertile and well cultivated, more so, however, in Lower than in Upper Silesia; and cereals of all kinds, oil-plants, beet, hops, occasionally vines, and, above all, flax and hemp, are the crops of the province; but of late years the cultivation of tobacco and of plants yielding dye-stuffs has been receiving increased attention. Cattle and sheep, the latter excellent in quality, and partly of pure or mixed merino blood, are reared in the highlands. The mines of Silesia are of great importance; iron, copper, and lead are the chief products; coal is found in abundance. The manufacture of lace is carried on in the mountainous districts, chiefly around Schweidnitz; and the production of other fabrics, as linen, cotton, and woolen goods, paper, iron, leather, glass, clocks, railway carriages, and earthenware, is vigorously carried on throughout the province. There are also breweries, distilleries, liqueur factories, and mills. The Oder and the great central railway from Berlin and Posen to Vienna afford ample facilities for commerce. There are a university at Breslau, 37 gymnasias in the principal towns, two military schools, and a great number of professional and industrial schools.

Silesia was inhabited at the beginning of the Christian era by the Quadi and Lygii, who, like the other German tribes, advancing westward in the 6th c., were succeeded by Slavic tribes. It formed part of the Slavic kingdom of Moravia, was next joined to Bohemia, and in the beginning of the 10th c. to Poland. In 1163 it was separated from the kingdom of Poland, but was ruled by dukes who were of the royal line of Piast; these dukes, to repopulate the country, which had been devastated by the numerous civil wars, encouraged the settlement of German colonies, especially in lower Silesia. The practice of division and subdivision of territory prevailed so extensively in Silesia that

at one time it had no less than 17 independent dukes, and to save itself from reincorporation with Poland, it acknowledged the sovereignty of the kings of Bohemia, with which, and with Germany, from the time of the emperor Karl IV., it was indissolubly connected. In 1537 the duke of Liegnitz, one of the numerous Silesian princes, entered into an agreement of mutual succession (*erbbeerbrüderung*) with the elector of Brandenburg, on the extinction of either reigning line; and the other ducal lines becoming gradually extinct their possessions fell to Liegnitz or to Bohemia, or lapsed to the emperor. In 1675, when the last ducal family, that of Liegnitz, failed, its territories of Liegnitz, Brieg, and Wohlau would have fallen to Prussia; but the emperor of Germany refused to recognize the validity of the agreement of 1537, and took possession of the Liegnitz dominions, as a lapsed fief of Bohemia. The remainder of Silesia was thus incorporated into the Austrian empire. In 1740, Frederick II. of Prussia, taking advantage of the helpless condition of Maria Theresa of Austria, laid claim, on the strength of the agreement of 1537, to certain portions of Silesia; and without declaring war, marched into and took possession of the province, maintaining his hold despite the utmost efforts of Austria in 1740-42, and 1744-45, called the *first* and *second* Silesian wars. After the *third* Silesian war, better known as the seven years' war (q.v.), it was finally ceded (1763) to Prussia.

SILESIA, AUSTRIAN, a duchy and crown-land of the Austrian empire, bounded on the n.e. by Prussia, and on the s.w. by Moravia. Area, 1987 sq. m.; pop. '90, 605,649. The population is about equally divided between the Germans and the Slavs. It is mountainous in the w., where the Spiegltitzer, Schneeberge, a summit of the Sudetic chain, rises to the height of 4870 feet. The climate, though rough, is healthy, and the soil produces good crops of rye, oats, barley, flax, etc. Within the crown-land rise the Oder and Vistula. Cattle-breeding and bee-keeping are important branches of industry. Iron, lead, and coal mining are profitably pursued. The manufactures are principally spirits, copper and iron wares, chemicals, sugar, liqueurs, glass, marble articles, paper, etc., and linen and cotton fabrics.

SILEX (Lat. flint), a generic name given by some mineralogists to all those minerals of which silica is the principal ingredient. See QUARTZ.

SILHOUETTE, the name given to a profile or shadow-outline of the human figure, filled in of a dark color, the shadows and extreme depths being sometimes indicated by the heightening effect of gum or some other shining material. This species of design was known among the ancients, and was by them carried to a high degree of perfection, as the monochromes on Etruscan vases amply testify; but the name silhouette is quite modern, dating from about the middle of last century. It was taken from Étienne de Silhouette, the French minister of finance in 1759, who, to replenish the treasury, exhausted by the costly wars with Britain and Prussia, and by excessive prodigalities, inaugurated numerous reforms, and the strictest economy of expenditure. His extreme parsimony in all finance matters made him a choice subject for caricature; so that any mode or fashion that was plain and cheap—"surtouts" without plaits, trousers without pockets—was styled *à la silhouette*; and profiles made by tracing the shadow projected by the light of a candle on a sheet of white paper being then much in vogue, have continued to bear the name. Although without merit as a work of art, the silhouette presents a clear and well-marked profile, and such instruments as the pantagraph (q.v.), etc., used to be frequently employed to obtain profiles of a reduced size direct from the human features. Profiles cut out of black paper with scissors also receive the name of silhouettes.

SILICA. See SILICON.

SILICON, or SIL'CIUM (sym. Si, eq. 14—in new system, 28—spec. grav. 2.49), is one of the non-metallic elements (see CHEMISTRY). It may be obtained in three different forms, viz., the *amorphous*, the *graphitoid*, and the *crystalline*. It is the amorphous silicon which is obtained by the processes in common use, the second and third being obtained from this first modification.

Amorphous silicon presents the appearance of a dull brown powder, which adheres to the finger, is insoluble in water and in nitric and sulphuric acids, but readily soluble in hydrofluoric acid, and in a hot solution of potash. It is a non-conductor of electricity, and when heated in air or oxygen its external surface burns brilliantly, and is converted into silica, which fuses from the extreme heat, and forms a coating over the unburned silicon. *Graphitoid* silicon is obtained by exposing the amorphous variety to an intense heat in a closed platinum crucible. This form of silicon will not take fire when heated in oxygen gas, and resists the solvent action of pure hydrofluoric acid, although it rapidly dissolves in a mixture of nitric and hydrofluoric acids; moreover, as another point of difference, it is a conductor of electricity. For the description of *crystallized* silicon, we may refer to a treatise by Deville (in the *Ann. de Chimie*, 3d ser. vol. 49, p. 65), who obtained it in regular double six-sided pyramids of a dark steel-gray color.

Silicon, in a state of combination with oxygen, is the most abundant solid constituent of our globe; and, in less proportion, is an equally necessary ingredient of the vegetable kingdom, while in the animal kingdom it occurs in mere traces, except in a

few special cases. It is never found in nature except in combination with oxygen; but by a somewhat difficult process—which we need not here describe—it may be separated as a dark brown powder. It was first isolated by Berzelius in 1823. For our knowledge of the other modifications we are indebted to Wöhler and Deville.

Silicon forms only one oxide, *silica*, SiO_2 ; and the hydrate corresponding to it is $\text{Si}(\text{OH})_4$, or H_4SiO_4 , sometimes called *ortho silicic acid*. Another hydrate, called *meta silicic acid*, H_2SiO_3 , is said to exist. These hydrates are very loose compounds, and quickly separate into silica and water; in that respect they resemble sulphurous acid, H_2SO_3 , and carbonic acid, H_2CO_3 .

Silicon dioxide, also called *silicic acid*, or *silica*, SiO_2 , exists both in the crystalline and in the amorphous form. The best examples of the crystalline form are rock-crystal, quartz, chalcedony, flint, sandstone, and quartzose sand. Silica in this form has a specific gravity of about 2.6, and is only attacked with difficulty by potash or hydrofluoric acid. The amorphous form exists naturally in opal, and is obtained artificially as gelatinous silica, etc.; it differs from the former in its specific gravity, being about 2.3, and in its being rapidly dissolved by potash and by hydrofluoric acid. Pure silica (as it occurs in rock-crystal, for example) is perfectly transparent and colorless, and is sufficiently hard to scratch glass. The heat of the oxyhydrogen blowpipe is required for its fusion, when it melts into a transparent glass, capable of being drawn out into elastic threads. Perfectly pure silica in its amorphous form may be obtained by various chemical processes. If a solution of silicate of potash or soda be treated with hydrochloric acid, the silicic acid separates as a hydrate, and on evaporating this to dryness, and treating it with boiling water, silicic acid remains as an amorphous powder, which, after being washed, dried, and exposed to a red heat, may be regarded as chemically pure. The hydrated silicic acid mentioned in the above experiment is soluble in water and (more freely) in acids and alkalies. The solubility of hydrated silicic acid in water accounts for the presence of silicic acid in mineral springs, and in the Geysers of Iceland, as well as for its gradual separation from these waters in the form of petrifications. That silica or silicic acid is a true acid (although a feeble one) is obvious from its uniting with bases, especially those which are capable of undergoing fusion, and forming true salts, known as silicates. These silicates occur abundantly in nature; all the forms of clay, feldspar, mica, hornblende, augite, serpentine, etc., being compounds of this description. Silicic acid combines with bases in various proportions. The following table, borrowed from Miller's *Elements of Chemistry*, vol. ii., shows the combinations which are of the most usual occurrence:

	Examples.	Formulae.
$2\text{MO}, 3\text{SiO}_2$, or Sesquisilicates.	{ Silicate of lime.....	$2\text{CaO}, 3\text{SiO}_2$.
	{ Meerschaum (hydrated silicate of magnesia).....	$2\text{MgO}, 3\text{SiO}_2 + 2\text{H}_2\text{O}$.
	{ Wollastonite (silicate of lime).....	CaO, SiO_2 .
MO, SiO_2 , Neutral silicates.	{ Diopase (hydrated silicate of copper).....	$\text{CuO}, \text{SiO}_2 + \text{H}_2\text{O}$.
	{ Olivine.....	$2(\text{Mg}, \text{Fe})\text{O}, \text{SiO}_2$.
$2\text{MO}, \text{SiO}_2$, Dibasic silicates.	{ Iron forge cinder.....	$2\text{FeO}, \text{SiO}_2$.
$\text{MO}, 2\text{SiO}_2$, Bisilicates.	The composition of many of the ordinary varieties of glass may be approximately represented by mixtures of different silicates which have this formula.	

In the above formulæ MO stands for 1 equivalent of any metallic protoxide, such as lime, magnesia, or protoxide of iron.

The following are the general characters of the silicates: Most of them are fusible, the basic silicates fusing more readily than those which are either neutral or contain an excess of acid. Excepting the silicates of the alkalies, no silicates are soluble in water. The anhydrous, neutral, and acid silicates of the earths resist the action of all acids except the hydrofluoric.

In conclusion we may remark that silica derives its name from *silex*, flint, of which it is the essential constituent, and that it is largely employed in the manufacture of glass, china, and porcelain. For these purposes it is obtained in a finely comminuted state by heating flints or portions of colorless quartz to redness, and plunging them in cold water. The silica splits up into a friable mass, which may be easily ground to a fine powder. The use of silica in giving firmness and rigidity to various parts of the animal organs is exemplified in its free occurrence in the quill-part of the feather of birds, in the shields of certain infusoria, and in the spicula occurring in sponges; while its similar use in the vegetable kingdom is seen in its more or less abundant presence in the stalks of the grasses, more particularly in the cereals and in the bamboo (where it is especially deposited about the joints, and is known as *tabasheer*), in the equisetæ, etc.

Silicon may be made to combine with several other elements besides oxygen, but, with the exception of silicofluoric acid, these compounds are of no practical value. Thus silicon and hydrogen form a hydride of silicon, a colorless and spontaneously inflammable gas. Nitride of silicon is a bluish fibrous body, while sulphide of silicon is a white earthy powder. Silicon unites with chlorine, bromine, and probably iodine and fluorine, in two proportions corresponding to its oxygen compounds. Fluoride of silicon SiF_4 , is a colorless pungent gas, liquefiable under strong pressure, and solidifying at -220°F . (-140°C .), inflammable, and a non-supporter of combustion. It is obtained by heating sand or powdered glass with fluor spar and oil of vitriol, and when a stream of this gas is transmitted through water a reaction takes place; four molecules of water and

three molecules of the fluoride of silicon yielding silicofluoric acid, H_2SiF_6 , which remains in solution, and gelatinous silica, SiO_2 , which is deposited. A saturated solution of this acid forms a very sour fuming liquid, which does not directly attack glass, but if allowed to evaporate on it, causes erosion from the fluoride of silicon becoming evaporized, and free hydrofluoric acid being left. A dilute solution is frequently employed in the laboratory as a precipitant of potash, which it throws down in a transparent gelatinous form. With salts of baryta it gives a white crystalline precipitate. It combines with bases to form salts, none of which are of any special importance.

SILIQUE, *Siliqua*, in botany, the fruit of the *cruciferae*, a capsule opening by two valves, which, when ripe, separate from the base upward, leaving a central frame (*replum*), to which the seeds remain attached, and which is regarded as formed by parietal placentas, the valves giving way close to the suture. The seeds are either in one row or two. A **SILICULE** (*silicula*) is merely a silique of a different form, the true silique being long and narrow, the silicule broad and short, although Linnaeus made this difference the foundation of the orders (*siliquosa* and *siliculosa*) of his class *tetradynamia*, a distinction not now equally attended to in the subdivision of the natural order *crucifere*.

SILISTRIA, a t. of the new principality of Bulgaria, is situated on the right bank of the Danube, which is here nearly one-fourth of a mile wide, and is studded with numerous islands. The houses are mean, and built generally of wood, though sometimes of stone, and also of mud; the streets, like those of most Moslem cities, are crooked, narrow, dirty, and ill-paved; and the manufactures are insignificant, though there is a considerable trade in wood, wheat, and cattle. Pop. '93, 11,710. The Dobrudscha, ceded by Turkey to Rumania in 1878, is bounded by a line running from a point just e. of Silistria to Mangalia on the coast. The importance of Silistria lay formerly in its value as a military outpost of Turkey. Its walls were constructed of solid masonry, but consisted merely of a fortified *enceinte* (q.v.) surrounded by a ditch, the great strength of the fortress depending upon the support given to it by detached works. Silistria is a town of great antiquity, and was a fortress under the Byzantines. Here, in 971, the Byzantine emperor, John Zimisce, routed the Russians under Sviatoslav. It has been repeatedly assaulted and taken by the Russians. In 1849 Silistria was made a stronghold of the first class, and was rendered almost impregnable by the addition (1853) of 12 detached forts on the s. and east. On the outbreak of the Crimean war the Russians laid siege to it, with an army of from 60,000 to 80,000 men, but were compelled to retreat after 39 days. The congress of Berlin in 1878, when erecting Bulgaria into a principality, decreed that the fortifications of Silistria, like those of the other Bulgarian cities, should be dismantled.

SILK AND SILK-WORM. The name *silk* is derived by the not unusual substitution of *l* for *r*, from Lat. *sericum* (Gr. *serikon*), so called as coming from the country of the Seres or Chinese. The **SILK-WORM** is the caterpillar of the **SILK-WORM MOTH**, of which there are numerous species belonging to the genus *bombyx* and other genera of the family *bombycidae*, lepidopterous insects of the section popularly known by the name moth (q.v.). The *bombycidae* have a very short and rudimentary proboscis, living for a very short time in their perfect state, and taking little or no food; the body is thick and hairy the wings are large and broad, either extended horizontally when at rest, or inclined like the sides of a roof; the antennae are pectinated. The caterpillars feed on the leaves and other tender parts of trees or other plants; the chrysalids are inclosed in a cocoon of silk, which gives to some of the species a great economical importance. The most important is the **COMMON SILK-WORM** (*bombyx mori*), a native of the northern provinces of China. The perfect insect is about an inch in length, the female rather larger than the male; the wings meeting like the sides of a roof; the color whitish, with a broad pale brown bar across the upper wings. The females generally die very soon after they have laid their eggs, and the males do not survive much longer. The eggs are numerous, about the size of a pin's head, not attached together, but fastened to the surface on which they are laid by a gummy substance, which, when dry, becomes silky. They are laid in the end of summer, and are hatched in the beginning of next summer. The caterpillar is at first very small, not more than a quarter of an inch in length, but rapidly increases in size, till, when full grown, it is nearly 3 in. long. It is of a yellowish gray color. The head is large. On the upper part of the last joint of the body is a horn-like process. The skin is changed four or five times during the growth of the caterpillar. Before each change of skin, it becomes lethargic, and ceases to eat, whereas at other times it is very voracious. When the skin is ready to be cast off, it bursts at the forepart, and the caterpillar then, by continually writhing its body, without moving from the spot, thrusts it backward; but silk-worms frequently die during the change of skin. A very rapid increase of size takes place while the new skin is still soft. The natural food of the silk-worm is the leaves of the white mulberry, but it will also feed on the leaves of some other plants, as the black mulberry and the lettuce. When so fed, however, it produces silk of inferior quality. The silk-producing organs are two large glands (*sericteria*) containing a viscid substance, which extend along a great part of the body, and terminate in two *spinnerets* in the mouth. These glands become very large when the change to the chrysalis or pupa state is about to take place. When about to spin its cocoon, the silk-worm ceases to eat, and first produces the loose rough fiber which forms

the outer part of the cocoon, and then the more closely disposed and valuable flier of its interior. In this process, the position of the hinder part of the body is little changed, but the head is moved from one point to another; and the cocoon when finished is much shorter than the body, which, however, being bent, is completely inclosed in it. The cocoon is about the size of a pigeon's egg. Each fiber of silk, when examined by a microscope, is seen to be double, being equally derived from the two silk-producing organs of the caterpillar. A single fiber often exceeds 1100 ft. in length. The time of the silk-worm's life in the caterpillar state is generally about eight weeks. About five days are occupied in the spinning of the cocoon; after which about two or three weeks elapse before the cocoon bursts and the perfect insect comes forth. The natural bursting of the cocoon is, however, injurious to the silk, and the silk-worm rearer prevents it by throwing all the cocoons into boiling water, except those which he intends to keep in order to the maintenance and increase of his stock. These he selects with care, so that he may have about an equal number of male and female insects, the females being known, even in the chrysalis state, by their larger size. The cocoons intended for the production of moths are placed on a cloth in a somewhat darkened room, of which the temperature is near, but does not exceed, 72° Fahr.; and the moths, when produced, show no inclination to fly away, but remain on the cloth, lay their eggs, and die there. It is an interesting peculiarity of this valuable species of moth, that neither in the caterpillar nor in the winged state does it show that restless disposition which belongs to many others, the caterpillars remaining contentedly in the trays or boxes in which they are placed, feeding on the leaves with which they are there supplied, and at last only seeking a proper place to assume the chrysalis form on small bundles of twigs which are placed for that purpose above the trays; the perfect moths, in like manner, abiding almost in one spot, and scarcely caring to use their wings. Owing to this peculiarity it is capable of being reared and managed in a way which would otherwise be impossible. See *illus.*, BUTTERFLIES, ETC., vol. III.; figs. 58-61; FOWL, ETC., vol. VI., figs. 33, 34.

The silk-worm is liable to various diseases, particularly to a fungus known as *silk-worm-rot* or *muscardine* (q.v.).

Of the other species of silk-worm, many are rapidly increasing in commercial importance. The following is an enumeration of the chief silk-producing insects; those in italics are not as yet employed in manufactures:

Bombyx mori.—The common silk-worm, native of India, and reared in other parts of the world.

B. crasi.—Crosses have been obtained between this and *B. mori*, yielding excellent silk, at Mussooree.

B. textor.—Native of Mussooree.

B. sinensis.—China.

B. huttoni.—Silk collected in Mussooree.

B. Horsfieldi.—Native of Java.

Attacus atlas.—Native of India, and said to yield some of the "Tusseh silk."

A. Guerini.—Native of Bengal.

A. ricini.—Native of Assam.

A. cynthia.—The "Eria," or "Arrindy" silk-worm, native of India, now extensively raised in Hong-kong, Nepal, Mussooree, Java, and to some extent in southern Europe. It feeds on the leaves of the *ailanthus* (q.v.) tree.

Antheræa Mezankooria.—The *Mezankooria* silk-moth.

A. Paphia.—The true tusseh or tussur moth, native of Darjeeling, and other parts of upper India. It is produced very extensively, and is chiefly collected in the jungle districts by the Sahars and other half-wild castes who live in the jungles. The cocoons are so carefully concealed in the leaves that much care is required to discover them, the only indication being the dung of the caterpillar under the trees. The tusseh silk is easily wound off from the cocoons in the same way as that of the common silk-worm.

A. Assama.—The Moonga, or Moogha, native of Assam.

A. Pernyi.—North China.

A. Perrottetti.—North China.

A. Roylei.—Mussooree.

A. Helferi.—Darjeeling.

A. Jana.—Java.

A. Frithii.—Darjeeling.

A. Larissa.—Java.

The preceding seven are all called tusseh moths.

Actias Selene.—Darjeeling.

Saturnia pyretorum.—China.

S. Grotei.—Darjeeling.

Lepa Katinka.—Java.

Neoris Huttoni.—Mussooree.

Caligula Tibeta.—Mussooree.

C. Simla.

Salassa Lola.—South-east Himalaya.

Cricula triferrestrata.—Java.

It will be seen by the above list that hitherto very few of the silk-moths have been turned to man's profit. The first in importance after the common silk-worm is the true *tussek*, next the *moonga*, the silk from both of which can be wound off the cocoon; and then the *eria*, which cannot be wound easily, and is therefore generally carded.

Silk appears not to have been well known to the ancients; although several times mentioned in the translations of the Bible, the best authorities deny that it is in the original, or that it was known to the Hebrews. Among the Greeks, Aristotle is the first who mentions it, and he only says that "Pamphile, daughter of Plates, is reported to have first woven it in Cos;" and from all the evidence which has been collected, it would appear that the natives of Cos received it indirectly (through the Phenicians and Persians) from China. The silken webs of Cos found their way to Rome, but it was very long before they were obtainable except by the most wealthy. The cultivation in Europe of the worm itself did not take place until 530 A.D., when, according to an account given by Procopius, the eggs were brought from India (China) to the emperor Justinian by some monks.

In China the cultivation of silk is of the highest antiquity, and according to the greatest Chinese authorities, it was first begun by Si-ling, the wife of the emperor Hoang-ti, 2,600 years B.C., and the mulberry was cultivated for the purpose of feeding them only 40 years later.

Since its introduction into Europe it has always formed a great branch of industry in Italy, Turkey, and Greece, and it has been cultivated to some extent in France, Spain, and Portugal. In England, too, from time to time, laudable efforts have been made to cultivate it, especially by Mrs. Whitby of Newlands, Mr. Mason of Yately in Hampshire, and lady Dorothy Neville of Dangstein in Hampshire; but their partial success has not encouraged others to pursue this branch of industry, which requires a warmer and less variable climate and cheaper labor than we can command.

The quantity of silk raised in the world is enormous. Great Britain imports annually in the unmanufactured state: "Raw" silk, about 6,500,000 lbs.; "waste," or knubs and husks, about 3,500,000 lbs.; besides undyed "singles," about 5,700 lbs.; tram, about 7,000 lbs.; organzine, about 39,000 lbs.; and dyed-singles and tram, about 3,000 lbs. organzine, about 10,000 lbs. Singles, tram, and organzine are terms applied to the thread after it has undergone certain operations (to be afterward described). The total quantity is thus about 10,000,000 lbs., of the value of £5,000,000; and in addition to this we import manufactured silk goods to the value of about £12,500,000; so that the importance of this little insect to Great Britain alone is represented annually by about £17,500,000. It requires 1600 worms to raise a pound of silk.

Rearing of Silk-worms.—It is of the first consequence in the production of silk that one of the species of mulberry should be cultivated, and that it should be so favorably situated as to climate that its foliage is in readiness for feeding the young worms when they are first hatched from the eggs. The species best adapted is the white mulberry, *morus alba*. The extreme lateness of season at which the black mulberry produces its leaves prevents its employment generally, besides which it will not bear the loss of its leaves so well. It is said that in some parts of China the silk-worm is easily reared upon the trees in the open air. So little has it a tendency to wander far from the place of its birth, if food be at hand, that it only requires a warm, dry atmosphere to bring it to perfection; but usually, even in China, and in all other countries, it is thought desirable to raise the silk-worm in properly arranged buildings, and to supply it with mulberry leaves gathered from day to day. In India, China, and other tropical countries, the eggs hatch readily at the proper time by the natural heat; but in southern Europe artificial heat is almost always required; formerly the heat of fermenting dung was found serviceable, and the warmth of the human body was also used, the eggs being carried in little bags in the bosom of the cultivators; but now they are regularly hatched by stove-heat, beginning with a temperature of 64° Fahr., which is gradually increased through ten days to 82°, at which it is maintained until the eggs are hatched. Experience has shown that the operation is facilitated by washing the eggs in the first place with clean water; and some cultivators also wash them in wine, the value of which is very questionable. Washing is found to remove a certain gumminess and other impurities from the eggs, which would otherwise impede the hatching. When the silk-worms have been regularly developed as above described, it is usual to place above the trays various little contrivances for the caterpillar to spin within; many of the Italian growers employ an ingeniously simple arrangement, which lasts many seasons, and when not in use occupies very small space. It consists of a number of thin slips of wood, about an inch and a half broad, and all cut sufficiently long to reach across the trays. They are each cut at intervals of an inch half through, so that one will fit into another, and when complete they all form a series of cells, which, set in a tray, form the very best receptacles for the silk-worm to spin in. When not in use, the whole arrangement can be compressed into very small compass for convenience of storage. Others use little cones of paper, or small twigs, among which the cocoons are spun.

In feeding the worms, care is taken so to distribute the food on the shelves or in the trays that the insects shall not crowd together; and for this reason the most careful cultivators chop the leaves small, and strew them very evenly about. Great care is taken not to let the worms of one hatch mix with those of another, unless of exactly the

same age, otherwise the stronger insects would deprive the younger of their food. Many other niceties of attention are required, which altogether render the successful rearing of silk-worms a matter of much anxiety and labor.

Preparation of Silk.—When the cocoons are completed, which is known by the absence of any sound within, they are carefully sorted, and a certain number are kept for laying. The sexes are readily known by the difference of shape as well as of size, the female being plumper, and the male, besides being much smaller, having a central depression and sharper extremities. The French growers sort them into nine varieties, those which are less compact, or in which the worm has died—a fact known by external indications—being separated from the good ones. When the sorting is finished, the cocoons are placed in an oven with a gentle heat, which kills the inclosed chrysalis, otherwise they would all become *perforated* by the insect eating through; they are then prepared for winding by first removing the flossy covering, which is often somewhat hard and compact. The cocoons are placed in basins of water, kept warm by charcoal fires, or, in the larger establishments, by steam. This softens and dissolves the natural gum which coats the silk, and makes the various coils of silk adhere together in the cocoon. The operator then takes a small branchy twig, and stirs them about in the water. This is sure to catch hold of any liberated ends which may be floating in the water. From three to five of these ends are taken and twisted together with the fingers, so as to unite them into one thread, which is passed through a polished metal or glass eye in the reeling-machine, which is so far from the hot-water basin as to give the softened gum on the silk time to dry in its passage from the basin to the reel. In large *filatures* or silk establishments, complex machinery is used for winding; but reeling apparatus of the greatest simplicity is used by the Chinese, East Indians, and others with almost equal effect, when carefully done, except in the amount of work accomplished. In all cases, however, the principle is the same, and is very simple. Great care and skill are required in reeling silk from the cocoons, because, although the reeler starts with four or five cocoons, not only are their individual threads apt to break, but they are not all of the same length, so that one will run out before the others. These matters are carefully watched; and as often as a thread breaks, or a cocoon runs out, another thread is joined on, and is made to adhere to the compound thread on the reel by its natural gumminess. Each cocoon generally yields 300 yards of thread, so that it takes 1200 or 1500 yards to make 300 yards of the filament of raw silk, by which name the reeled silk is always known. The raw silk is made up into hanks of various sizes. That from China and Japan is tied in packages of six hanks each, technically called *books*, and sometimes the ends of these books are covered with silken caps very curiously formed out of a single cocoon, so managed as to form a filmy cap sufficiently large to cover a man's head. The method used by the Chinese to accomplish this is quite unknown in Europe. These caps or bags, when closed, are sometimes nearly a foot square, and much of the wadding used by the Chinese dressmakers for padding is made by placing these bags upon each other to the required thickness.

Notwithstanding the care taken in reeling the silk from the cocoons, and forming several threads into one, it is not ready for the weaver, but has to undergo the processes called collectively *throwing*. In this country, this is a special trade, the *silk throwster* usually conducting it in large mills with extensive machinery, where the above processes are all carried on, generally by steam-power. The silk reaches the throwster in hanks as imported. These are put into clean soap and water, and carefully washed, ties having been placed at intervals, to prevent the silk entangling. After being dried by hanging in the drying-room, they are placed on large skeleton reels called *swifts*, so adjusted that they will hold the hanks tightly. In a *swift*, the spokes are in pairs. They are made of thin pieces of lancewood, and each pair are rather nearer together at the axle than at the circumference, where they are connected together by a small band of cord. These bands are so tied that they will slip down easily to admit of the hanks being placed; then, by pushing the cords upward, the hank can be stretched to its fullest extent. This is necessary to compensate for the varying lengths of the hanks received from different countries.

When the *swifts* are set in motion, the silk is carried from the hanks to bobbins, upon which it is wound for the convenience of further operations. The bobbins are then taken from the *winding* to the *cleaning* machine, when they are placed on fixed spindles, so that they will turn with the slightest pull; and the thread is passed through a small apparatus attached to the machine, which is specially called the *cleaner*, and consists essentially of two polished smooth-edged blades of metal, attached to a part of the frame of the machine. They are held together by a screw, and are slightly opened or closed by another screw, so that the thread can be put between them down to a small orifice, and then, by tightening the screw, preventing its return, after passing through this small hole, which is the gauge of the thread, and which removes any irregularities or adherent dirt. The silk next passes over a glass or metal rod, and then through another small hole, much larger than that of the *cleaner*, and usually made of glass, on to the bobbin, upon which it is wound by the action of the machine. The next process is *twisting* the cleaned thread, by which it becomes better adapted for being combined with other threads. *Doubling* is the next process, and this consists in running off a number of bobbins of *twisted* silk on to one bobbin of a larger size, which is put into the *throwing*-machine, when the ends of the *doubled* silk are passed through a smooth hole on to a

large reel, which rewinds it into hanks, but twisting the threads into a fine cord as it goes from the bobbins to the reel. This operation of *throwing* derives its name from the Saxon *throwan*, to whirl or twist. After this the hanks have to be again wound on reels and bobbins for the weaver, the former for the warp, and the latter for the weft. For many purposes, only some of these operations are required. Thus for common and light fabrics, such as *Persian gauze*, etc., only the two first are needed—viz., the *winding* and *cleaning*, and the material is called *dumb-singles*. If it has been *wound*, *cleaned*, and *thrown*, it is called *thrown-singles*, and is used for weaving common broad stuffs, or plain silks and ribbons. If *wound*, *cleaned*, *doubled*, and *thrown*, it is called *tram*, and is used for the richest silks and velvets, but only for the weft or shoot; and if *wound*, *cleaned*, *spun*, *doubled*, and *thrown*, it is called *organzine*, and is used for the warps of fine fabrics.

Before winding the cocoons, a flossy portion has to be removed; and after all has been wound off, another portion remains, like a compact bag; these are collected and sold under the name of *waste-silk*, and to these are added the fragments of broken threads, which accumulate in considerable quantities during the reeling and throwing operations. Formerly, very little use was made of waste-silk; not a little of it was employed by engineers and others for mere cleaning purposes; although as early as 1671, a proposition was made by a manufacturer named Edmond Blood to make it available by carding it with teasels or rowing-cards. He took out a patent for this invention, but apparently did not bring it into use. Another patent was taken out by Mr. Lister of Bradford, which has done wonders; now the waste is all spun into yarn, thereby greatly economizing the use of silk, as the quantity of silk-waste always greatly exceeds the amount of good silk reeled off. The processes employed in the production of silk-yarn from the waste differ little from those for spinning other materials. See SPINNING.

The silk manufactures of Britain are chiefly located in Spitalfields, London, at Macclesfield and Congleton in Cheshire, at Derby, and in Glasgow. The dyeing of silk is done chiefly in the neighborhood of London, at Nottingham, and at Manchester; and considerable quantities of silk goods are sent from India to be printed with patterns in London and other parts of England. There would certainly appear to have been no lack of encouragement of the silk industry in the early days of American colonial history. James I. was enthusiastic on this subject (see MANUFACTURES), and the colonists themselves devoted much time and labor to the growth of the mulberry tree, and the culture of silk-worms. In 1732 the colonial government of Georgia, allotted a piece of ground for use as a nursery plantation for white mulberry trees. Lands were granted to settlers on condition that they planted 100 of these trees on every 10 acres when cleared, 10 years being allowed for their cultivation. In 1749 the British parliament passed an act exempting from duty all raw silk which was certified to be the production of Georgia or Carolina. In the same year an Italian expert was sent to Georgia to conduct a filature—for reeling, doubling, cleaning, and twisting, or throwing, silk—and in 1759 the receipts of cocoons at the filature exceeded 10,000 pounds, and the quality of the raw silk was so good that it sold in London as high as three shillings a pound more than that from any other part of the world. After 1759, however, the production of silk in Georgia fell off greatly, though a French settlement at New Bordeaux, on the Savannah river, manufactured considerable quantities of sewing-silk during the revolution. Mansfield, Conn., became, in the latter part of the 18th c. an important silk-raising section; and this continued to be a fixed industry in that locality, though but little was done in it elsewhere in New England. Pennsylvania engaged in the culture about 1767, and a filature was established in Philadelphia in 1769 or '70, and in 1771 2,300 pounds of cocoons were brought there to reel. This state maintained some prominence in the industry up to the time of the revolution, but it then died out and was not notably revived. From the period of the close of the revolution up to about 1825 the silk manufacture in the United States was purely domestic, families making small quantities—hardly ever reaching 100 pounds per annum in a single family. The importation of silk goods in the mean time had increased enormously, so that in 1821 it amounted to \$4,486,924. It was felt that this costly importation should be stayed, if possible, and several congressional committees investigated the subject, and voluminous reports were made upon it. This brought about the enthusiastic culture of the *morus multicaulis*, which grew into a mania (see MANUFACTURES), during whose existence hundreds of speculators and thousands of private buyers were ruined. The result of this speculative incident, the financial depression of 1837, and the fact that in 1844 a blight affected all the mulberry trees in the country—all these causes combined were disastrous to silk culture in the United States, and the effort to rear silk-worms ceased, not to be revived again, except in California; where 1860-75, the business was largely prosecuted, but ended disastrously. The first silk-mill on the western continent was set up at Mansfield, Conn., in 1810. The manufacture was introduced into Philadelphia about 1815; and as early as 1824 the Jacquard loom began to be used there. Power-looms were next introduced, and power-loom weaving was begun about 1838, simultaneously with its adoption in Switzerland. In 1829 there was a manufactory for silk ribbons from

American silks started in Baltimore, but it was short-lived. The business progressed at Mansfield, which soon became a silk-manufacturing center. From 1831 to '39, a large number of factories were started at Windsor Locks, Conn.; Poughkeepsie, N. Y.; in Philadelphia, and elsewhere, the most of which failed. Burlington, N. J., became an important silk-producing locality, beginning about 1838; and included the culture of the mulberry tree and growth of silk-worms, as well as the manufacture of silk. Hartford, So. Manchester, Conn., Holyoke and Northampton, Mass., and Haydenville, the scene of the Mill river disaster in 1874 (bursting of a reservoir containing 6,000,000 tons of water), are among the New England towns in which silk has been manufactured extensively. But the most important center of this industry in America is Paterson, N. J. (q. v.), where the water-power of the Passaic river, facilities for transportation, etc., seemed to offer the best possible conditions for its prosecution. The first silk-mill in Paterson was set up about 1838, in the fourth floor of Samuel Colt's pistol factory. This was followed by the establishment of other factories, until in the years immediately succeeding the conflict of 1861-1865, Paterson became—and has since remained—the chief seat of silk manufacture in the United States. The number of silk establishments reported in the state of New Jersey in the year 1890 was 132; average number of men and women employed therein, 17,917; of boys and girls, 863; wages paid, \$7,176,180; capital invested, \$16,809,927; value of product, \$30,760,371.

The quantities and values of raw silk imported to supply the needs of American manufactures, were as follows in the years * named:

1876.....	1,354,991 lbs.	\$5,424,408
1877.....	1,186,170 "	6,792,937
1878.....	1,182,750 "	5,103,084
1879.....	1,889,776 "	8,371,025
1880.....	2,562,236 "	12,024,699
1881.....	2,531,617 "	10,889,675
1882.....	2,877,776 "	12,885,149
1883.....	3,255,324 "	14,042,696
1890.....	5,943,360 "	24,331,867

* Year ended June 30.

A general view of the silk industry in the U. S. is shown from the following figures from the census of 1890:

STATE.	Establishments.	Average Number of Employees.	Wages Paid per Year.	Net Value of Products.
California.....	9	214	\$83,566	\$266,312
Connecticut.....	35	5,081	2,006,804	8,123,561
Illinois.....	10	805	295,636	785,845
Maryland.....	4	75	24,233	100,361
Massachusetts.....	20	3,216	1,296,399	4,611,959
New Jersey.....	132	17,917	7,176,180	25,405,982

SILK-COTTON. Under this name, various silky fibers are from time to time brought from tropical countries to Europe; they are all of the same general character, and are produced by the trees composing the genus *bombax* and other genera recently separated from *bombax*, of the natural order *sterculiaceæ*, known as silk-cotton trees. These trees are natives of the tropical parts of Asia, Africa, and America. The fiber fills their large woody capsules, enveloping the seeds, and is produced in great abundance, but is too short, too smooth, and too elastic to be spun by the machinery used for cotton; although attempts have been successfully made on a small scale in India to spin and weave it; and that of *bombax villosum*, which is of a beautiful purple color, is woven into cloth and made into articles of dress in new Spain. Silk-cotton is much used for stuffing pillows, mattresses, and sofas. Sir James Emerson Tennent says it "makes the most luxurious stuffing" for them. It has the fault, however, of being easily broken and reduced to powder, but might probably be very useful in the manufacture of gun cotton and colloidion. The silk-cotton of the East Indies is imported into Britain under the name of *moc-main*.—*bombax ceiba*, the common silk-cotton tree of the West Indies and South America, attains a very great size, its trunk sometimes being so thick that it could not be encompassed by the outstretched arms of sixteen men, and canoes are hollowed out of it of an average burden of 25 tons. The wood is soft and spongy, but is used for many purposes, and when cut into planks, and saturated with lime-water, it bears exposure to the weather for many years.—*Bombax malabaricum*, or *salmalia malabarica*,

is the common silk-cotton tree of the East Indies. It is a tall tree, covered with formidable thorns. Although it is a tropical tree, its leaves fall annually; and just before the fresh leaves appear, it is covered with crimson tulip-like flowers, so abundant that, "when they fall, the ground for many rods on all sides is a carpet of scarlet."

The fiber of the capsules of *chorisia speciosa* and *C. Pecholiana*, trees nearly allied to the genus *bombax*, and natives of Brazil, is known as **VEGETABLE SILK**. It has a beautiful satiny luster, and is very light, but no mode of spinning and weaving it has yet been invented.

SILK SPIDER, *Nephila plumipes* (Koch), a species of spider discovered by Prof. Burt G Wilder on the sea islands of South Carolina in 1865. It produces two kinds of silk, yellow and white, having a continuous length of nearly two miles.

SILK-WEED, or **MILK-WEED**. See **ASCLEPIADACE**; **ASCLEPIAS**.

SILK-WORM GUT, a material used by anglers for dressing the hook-end of the fishing-line. It is prepared from the silk-worm at the period when it is just about to spin, and the sericteria or silk vessels are distended with the secretion. The worms are immersed for 12 or 14 hours in strong vinegar, and then taken separately, and pulled in two very gently. The skilled operator knows at sight if the soaking in vinegar has been sufficient, and if so, he lays hold of one end of the viscid secretion, which is seen in the silk glands, and attaches it to the edge of a board; the other end he stretches to the other edge of the board, and attaches it with a pin. When a number are drawn across the board, it is set in the sun for the threads to dry, when they are tied into bundles for use. They are chiefly produced in Italy and Spain.

SILL, EDWARD ROWLAND, poet and educator, born at Windsor, Conn., 1841; educated at Andover, Mass. and at Yale College, where he was class poet. After graduating in 1861 he resided in California till 1866; entered Harvard Divinity School, but soon abandoned theology; taught school in New York and did literary work; taught school in Ohio, three years; in 1871 became principal, Oakland, Cal., high school; prof. English language and literature in University of California, 1874-82; resumed literary work at Cuyahoga, O.; died at Cleveland in 1887; published *The Hermitage and other Poems* (1867); *The Venus of Milo and other Poems* (privately printed, 1883). A posthumous volume of verse appeared in 1888, and a new edition of his poems in 1889.

SILLIMAN, BENJAMIN, American physicist, was b. at North Stratford (now Trumbull), Conn., United States, Aug. 8, 1779. His father was a distinguished lawyer, and a brig. gen. in the war of independence. He was educated at Yale college, New Haven, in which he was appointed a tutor in 1799, and was admitted to the bar in 1802, but soon after received from the college the appointment of professor of chemistry; which he accepted only on condition of visiting some of the seats of learning in Europe, to observe the progress of the science. His tour in Europe, 1805-6, was one of the first of which an account was published in the United States. Uniting mineralogy and geology to chemistry, he made a geological survey of Connecticut, observed the fall of a meteorite; constructed, with the aid of Prof. Hare, a compound blow-pipe, and repeated the experiments of sir Humphry Davy. In 1822 he first established the fact of the transfer of particles of carbon from the positive to the negative electrode of the voltaic apparatus. In 1818 he founded the *American Journal of Sciences and Arts*, better known as *Silliman's Journal*, of which he was for 20 years the sole, and for 8 more the principal editor. Besides his labors as professor and editor, he began in America the since widely extended work of popular scientific education, by giving public lectures on his favorite sciences in all the chief cities. In 1830 he published a text-book on chemistry, and soon afterward edited an edition of *Bakewell's Geology*. An account of his last visit to Europe was published in 1851, and reached 6 editions. His last course of lectures was given in 1855, when his son, BENJAMIN SILLIMAN, Jr., who had been his associate, became his successor. He died in Nov., 1864.

SILLIMAN, BENJAMIN, JR., b. Conn., 1816; graduated at Yale college, 1837, where he was an instructor in chemistry, mineralogy, and geology, 1838-46; professor of applied chemistry, 1846; one of the beginners of the Yale scientific school, 1847; professor of medical chemistry and toxicology, university of Louisville, Ky., 1849-54; and of chemistry, as successor to his father, at Yale college from 1854 for abt. 30 years; state chemist of Connecticut, 1869; associate editor of *Silliman's Journal of Science*, 1838; and associate proprietor, 1846; a director of the departments of chemistry, mineralogy, and geology in the world's fair at New York, 1853; for many years secretary of the American association for the advancement of science. He published *First Principles of Chemistry*; *Principles of Physics*; many papers on scientific subjects; and was also a popular lecturer on science. He d. 1885.

SILLOTH, a t. and watering-place of England, of quite recent origin, in the county of Cumberland, at the terminus of a branch of the North British railway, 12 m. n.n.e. of Maryport, is picturesquely situated on the Solway. The port is of growing importance, and possesses a good stone dock, and there is a growing trade in coal and grain. Silloth is much resorted to for sea-bathing, the climate being mild and salubrious, and considered highly favorable for those affected with pulmonary complaints. Pop. about 2500.

SILLOWAY, THOMAS WILLIAM, b. Newburyport, Mass., 1828; ordained minister of the Universalist faith, 1862; became a designer of plans for public buildings in Boston.

1851. He has built and reconstructed several hundred churches and public buildings in different parts of the United States. He has edited books on architecture, ventilation, etc., and published *Text-Book of Modern Carpentry*.

SILLO. See ENSILAGE.

SILLOAM, or **SHILOAH**, is spoken of three times in Scripture: Isaiah says, "the waters of Shiloah that go softly;" Nehemiah calls it "the pool of Siloah;" and John, "the pool of Siloam." Josephus says it was at the mouth of the Tyropeon, where a fountain is still found. Jerome mentions its intermitting flow, which is still observed. The water descends from the fountain of the Virgin through a long subterranean passage into a basin under the cliff, and thence into a larger reservoir. That this passage connects the fountain and the pool, Dr. Robinson proved by crawling through it from one end to the other, a distance of 1750 feet. He witnessed also the intermitting flow in the fountain, as well as the pool.

SILPHIUM, a genus of plants belonging to the order *compositæ*. Generic characteristics: heads many-flowered, radiate; rays numerous, pistillate and fertile; ovaries in two or three rows; disk flowers apparently perfect, but with undivided style and sterile; scales of the broad and flattish involucre imbricated in several rows, broad, and with loose, leaf-like summits, except the innermost, which are small. They are tall, coarse, perennial herbs, having a copious resinous juice, and large corymbose-panicled yellow flowering heads. *Silphium luncinatum*, called rosin-weed and compass-plant, is rough and bristly, growing from 3 to 6 ft. high; leaves pinnately parted, with divisions lanceolate or linear, rarely entire: scales of the involucre ovate, tapering into long and spreading rigid points; achenia, or one-seeded capsule, broadly winged and deeply notched. It grows on the prairies of Michigan, Wisconsin, and southward and westward: blossoms in July. It is called compass-weed from its reputed property of growing so as to point its leaves to the cardinal points of the compass. Another species, *S. terebenthinaceum*, the prairie burdock, grows from 4 to 10 ft. high, with many small heads in a panicle at the top; leaves ovate-cordate, serrate toothed, thick, rough, more so beneath, and from 1 to 2 ft. long on slender leaf-stalks. A variety, *pinnatifidum*, has deeply cut, or pinnatifid leaves. It grows on prairies and oak openings, Ohio, Michigan, Wisconsin, and southward: blooms in July and September. Other species are *S. trifoliatum*, *S. asteriscus*, *S. integrifolium*, and *S. perfoliatum*, the cup-plant, which grows from 4 to 8 ft. high, having ovate leaves, coarsely toothed, the upper united by their bases, forming a cup-shaped disk; heads corymbose, and achenia winged and variously notched; grows on rich soils along streams in Michigan, Wisconsin, and southward. Also escaped from gardens eastward: blossoms in July.

SILURIAN ROCKS, a large division of the palæozoic rocks, between the old red sandstone and the Cambrian strata. They comprise the greater portion of the rocks called by Werner "transition," because, as he thought, in their structure they exhibited an intermediate character between Lehman's "primary" or metamorphic rocks, and the "secondary" or fossiliferous deposits. But the fossils peculiar to these beds having been found in rocks without the transition structure, the name has long ago fallen into disuse. The term "grauwacke" or "graywacke," a miners' term, was also introduced from the Germans, and for some time employed to designate these rocks, because of the abundance in them of a compact argillaceous sandstone; but this awkward name has also given place to Silurian, a term introduced by sir R. I. Murchison when he first established the system, and derived from the district where he investigated the strata, which was the region of the Silures, (apparently a non-Celtic, Euskarian tribe).

The Silurian system contains an enormous thickness of rocks, nearly 30,000 ft., according to some estimates, the absolute thickness being greatly increased by immense beds of interstratified igneous rocks. The upper limit, underlying the old red sandstone, is universally accepted, but there has been considerable diversity of opinion in regard to the inferior boundary. Prof. Sedgwick, having described the rocks of n. Wales, which at first were considered to be older than the series which Murchison had illustrated, designated them Cambrian. This name has been retained for the immense mass of indurated shales and sandstones of a thickness nearly equal to that of the Silurians, which contain only faint traces of organic life, and underlie the Llandeilo formation. But Sedgwick claims also the lower Silurian rocks as a portion of his system; the priority of name, and the uniform facies of the organic remains of the whole of the Silurian rocks, have, however, induced geologists to consider the limits as originally given by Murchison as those of the system.

The subdivisions of the rocks of the period are the following:

UPPER SILURIAN ROCKS.

	Thickness in Feet.
<i>Upper Ludlow</i> —	
1. Downton Sandstone and Tilestones.....	80 to 1000
2. Upper Ludlow Shale.....	800
<i>Lower Ludlow</i> —	
3. Aymestry Limestone.....	150
4. Lower Ludlow Shale.....	900

SILURIAN AND DEVONIAN FOSSILS.—1, 5. *Spirifer speciosus*; *Spirifer calcaratus*. 2. *Goniatites*. 7. *Murchisonia angulata*. 8. *Productus aculeatus*. 9. *Enomphalus rugosus*. 10. *Enomphalus*. 14. *Enomphalus serpula*. 15. *Holoptychius nobilissimus*. 16. *Pentatremites ovalis*. 20. *Pterichthys latus*. 21. *Orthoceras literale*. 22. *Paradoxides Bohemicus*. 26. *Hypanthocrinus Buchii*. 27. *Receptaculites Neptuni*. 28. *Calamopora polymorpha*.

ites Buchii. 3. *Leptæna depressa*. 4. *Calymene Blumenbachii*. 6. *Oldhamia antiqua*.
 ites flabelifera. 11. *Arges armatus*. 12. *Tubicaulis solenites*. 13. *Phagmoceras lituites*.
 17. *Palæoniscus Freieslebeni*. 18. *Bellerophon primordialis*. 19. *Chonetes striatella*.
 3. *Catenipora labyrinthica*. 24. *Cyathophyllum flexuosum*. 25. *Clymenia undulata*.
 a. 29. *Avicula reticulata*. 30. *Melocrinus hieroglyphicus*. 31. *Cephalaspis Lyellii*.

	Thickness in Feet.
<i>Upper Wenlock—</i>	
5. Wenlock Limestone.....	300
<i>Lower Wenlock—</i>	
6. Wenlock Shale.....	1400
7. Woolhope Limestone and Denbighshire Grit.....	150
MIDDLE SILURIAN ROCKS.	
<i>Upper Llandovery—</i>	
8. Tarannon Shale.....	1000
9. May-hill Sandstone and Pentamerous Limestone.....	800
<i>Lower Llandovery—</i>	
10. Llandovery Slates.....	1000
LOWER SILURIAN ROCKS.	
<i>Caradoc—</i>	
11. Caradoc Sandstone.....	} 12,000
12. Bala Limestone.....	
<i>Llandeilo—</i>	
13. Upper Llandeilo.....	} 1500
14. Lower Llandeilo or Arenig Beds.....	
Contemporaneous Volcanic Rocks.....	5800

The typical Silurian strata are in Wales, and the adjoining English county, Shropshire. With the exception of the southern and south-eastern districts, where the old red sandstone and coal measures occur, the whole of Wales is composed of Silurian and Cambrian rocks. The same deposits are found in Cumberland and the n. of Lancashire. The whole of Scotland, s. of a line drawn from Dunbar on the e. to Girvan on the w., consists of graywacke rocks, slates, and limestones of Silurian age, with the exception of one or two small patches of old red, carboniferous, and pernian strata. The rocks, till recently referred to an azoic group, below the lowest fossiliferous strata in the n. of Scotland, are now generally believed to be highly altered beds of this period. The southern boundary of these beds is a line drawn from Stonehaven to Helensburgh. A huge trough, filled up with old red sandstone and carboniferous strata, separates the highly altered strata of the north from the less altered deposits of the south. An extensive region of Silurian rocks occurs in the south-eastern counties of Ireland and in Galway; and a great track of the same beds extends from the center of Ireland (Cavan, etc.) to the coast of Down. The metamorphic rocks of the north-west are most probably also of the same age as the corresponding strata in the n. of Scotland.

On the continent Silurian strata have been examined and correlated with the British types, in Bohemia, by M. Barrande; in Scandinavia by M. Angelin; and in Russia by Murchison and others. In North America, also, extensive regions are covered with these strata. They have been wrought out and their fossils described by the Canadian and United States surveyors. Similar strata have also been detected in India, Australia, and South America.

The life of the period presents a group of very characteristic organisms, which, with the exception of the fish-remains found in the upper beds, all belong to the invertebrata. Many of them are confined to the Silurian rocks, or occur only very rarely in some of the palæozoic formations. The graptolites are a strictly Silurian family of zoophytes, and most of the forms of trilobites are found only in this period, though some members of the tribe are found in rocks of Devonian and carboniferous age. Besides these may also be specified such forms as heliolites and favosites among the corals; actinocrinites and the cystidians among the echinoderms; orthids and lingula among the brachiopods; and litiutes and maclurea among the cephalopods.

In all the immense thickness of Silurian rocks no deposit has been discovered containing organisms that have lived on land. Some fragments have been noticed that have a faint resemblance to the branches of lepidodendron, and minute bodies occur in the bone-bed, which are referred to the spores of a terrestrial cryptogam. The only other indications of plants are impressions believed to have been produced by sea-weeds. The anthracitic shales of Wales and Scotland probably derived their anthracite from the algæ that must have abounded in the Silurian seas. In Shropshire a number of shells have been found, whose nearest allies are littoral species, and these appear to indicate the existence there of an ancient shore. The Silurian rocks are, however, generally sea deposits, and Forbes has ingeniously shown, from the small size of the conchiferæ, the paucity of spiral univalves, the great number of floating shells and of the pelagic orithidæ, and the great rarity, or absence except in the upper beds, of fossil fish, that it is most probable they were deposited, in a sea more than 70 fathoms deep.

The rocks of the lower Silurian division in North America embrace, I. the primordial, or Cambrian period, which again embraces the Acadian and the Potsdam epochs. II. Canadian period, which embraces the calciferous, the Quebec, and the Chazy epochs. III. Trenton period, embracing the Trenton, Utica, and Hudson river epochs. The upper Silurian embraces, I. the Niagara period, with Medina, Clinton, and

Niagara epochs. 2. Salina period, containing the Onondaga salt group. 3. Lower Helderberg period, containing the lower Helderberg limestone which includes in New York the water lime group, the lower pentamerous limestone, the delthyrs shaly limestone, and the upper pentamerous limestone. 4. Oriskany period, containing the Oriskany sandstone.

In the Acadian epoch the rocks are exposed to view in valleys in New Brunswick. They are gray and black shales with some sandstones, and have a thickness of 2,000 feet. In the Potsdam epoch in Labrador and Newfoundland are strata of limestones, sandstones, and shales from 5,000 to 5,600 ft. thick. In New York, Vermont, and Canada, rocks, lying upon the Archean, are hard sandstones, sometimes pebbly conglomerates. The sandstones are laminated, gray, drab, yellowish, brown, and red, often good building stone, as at Potsdam and Malone. In Clinton and St. Lawrence the conglomerate is often 300 ft. thick. In western Vermont there is red sandrock and Winooski limestone. Along the Appalachians the striking characteristic is the great thickness of the formation. In Pennsylvania there are in the primal series of Rogers 2,000 ft. of lower slates upon which rests 90 ft. of sandstone, and above this from 200 to 1000 ft. of upper slates. The pictured rocks on the s. shore of lake Superior, and the pillared rocks at the w. end of the lake are considered to be of Potsdam formation. The primordial rocks bear evidence only of marine life. The plants are chiefly fucoids. The animals are all invertebrates, as crinoids, brachiopods, pteropods, gasteropods, and cephalopods, worms and crustaceans, including trilobites (q.v.).

The rocks of the Canadian period appear at the surface in northern New York, Canada, northern Michigan, and Wisconsin; also in the Green mountains, the eastern Appalachians, from New Jersey southward, and in Missouri, Arkansas, and the Rocky mountains. The fossil flora and fauna of the Canadian period much resemble that of the primordial, but are more particularly rich in graptolites (q.v.). The earlier part of the Trenton period was particularly limestone-making. A broad belt of limestone of this period extends from eastern New York to Wisconsin, Minnesota, and Missouri, including the Galena limestone. It forms the bluffs at Trenton falls. The general thickness is from 100 to 500 ft., reaching 1000, and in Pennsylvania, 2,000 feet. The Utica shale comes to the surface in the Mohawk valley. Sea weeds are the only known fossil plants. Among the radiates are crinoids and star-fish, corals made their first appearance. Various mollusks were numerous, and among crustaceans trilobites were abundant. The strata are much upturned, some of them having a vertical position, others inclining from 10° to 90°, the greater part between 30° and 60°.

In the upper Silurian, the Niagara period contains Oneida conglomerates, in Oneida co., N. Y., the lower member of the Medina epoch, the upper being Medina sandstone. The conglomerate is 500 ft. thick in the Shawangunk mountains, where it is called Shawangunk grit. The rocks of the Niagara epoch are very extensive, occupying a large portion of the interior of the continent, and they are to a great extent limestones, this being also a limestone-making epoch. Near Niagara falls there are 165 ft. of limestone resting on 80 ft. of shale, and at the falls 85 ft. of limestone resting on 80 ft. of shale. Along the Appalachians the rocks have a thickness of 1500 feet. Niagara limestone occurs on the shores of Wellington and Barrow's straits and on King William's island, and common chain coral has been found in the Arctic regions. There is lead and copper in the Shawangunk grit in Ulster co. N. Y., and these metals are found in other Silurian rocks. Petroleum occurs in large quantities in Niagara limestone at Chicago, Ill., but is not easily worked. The only fossil plants are sea weeds. As to animals the sandstones of the Medina and Clinton groups contain the remains of many brachiopods and lamellibranchs, but only a few corals and crinoids. The Clinton and Niagara limestones, however, are rich in corals, crinoids, trilobites, and brachiopods, while there are but few lamellibranchs or muddy bottom mollusks. The fine sandy and clayey character of the Medina beds shows that at the time of their deposition central New York was an extensive area of low, sandy sea shores, flats and marshes, not exposed to heavy waves, and that a similar condition extended westward to Michigan. The beds of the Niagara epoch bear evidence of having been formed in deep seas, from the thickness of the limestones in the Mississippi basin and elsewhere. After the elevation of the Green mountains, according to Dana, there was a gradual sinking which moved the coast line eastward to the Hudson, so that over New York and the interior basin there was a vast limestone-making sea. At the same time there was another large sea in the St. Lawrence region. In the course of these oscillations, from the beginning of the Trenton to the close of the Niagara period there was a deposition of 12,000 ft. of rock along the Alleghanies.

SILURIDÆ, a family of malacopterous fishes, divided into many genera, and including a great number of species, mostly inhabitants of the lakes and rivers of warm countries. The siluridæ exhibit great diversity of form. Their skin is generally naked, but some have a row of bony plates along the lateral line, and a few are completely mailed with bony plates. The dorsal fin is single in some; others have two dorsal fins, the second being sometimes adipose, as in the salmon family. The dorsal fin is sometimes armed with a strong spinous ray, and in most of the family the first ray of the pectoral fins is very strong and serrated, so as to be capable of inflicting a severe wound, and by

this these fishes are protected from alligators and other enemies. All have the mouth furnished with barbels, more or less numerous; the two principal barbels being on the upper lip, and formed by elongation of the intermaxillary bones. The barbels are believed to be organs of touch, probably of use in directing the fish to its prey. The bones of the head and other parts of the skeleton exhibit many peculiarities, into which we cannot enter. The siluridæ are generally inhabitants of muddy rivers, lurking among the mud. The only European species is the *SLY SILURUS*, SHEAT-FISH, or SHADEN (*silurus glanis*), the largest of European fresh-water fishes, and sometimes found in the sea near the mouths of rivers. It does not inhabit any of the rivers of Britain; its introduction has, however, recently been attempted. Neither is it found in France, Spain, or Italy, but it is plentiful in the Danube, the Elbe, and their larger tributaries, also in the rivers which fall into the Caspian sea; and it is found in some of the rivers of North America. It attains a length of six or even eight feet, and a weight of 300 or 400 pounds. The flesh is white and fat, but soft, luscious, and not very easily digestible. In the northern countries of Europe it is preserved by drying, and the fat is used as lard. The habits of the fish are sluggish. It seems rather to lie in wait for its prey than to go in quest of it.—Several species of this family are found in the Nile, among which is the *HARMOUTH* or *KARMOOT* (*clarias anguillaris*), a fish in its general form and appearance much resembling that just described. It was anciently an object of superstitious regard in the Thebaid.

SILVAS, or **SELVAS** (Span. *selva*, a forest), the name given to the western portion of the great plain of the Amazon, in the n.w. of Brazil. The silvas, which are about one-third of the whole plain, contain more than 700,000 English sq.m., and consist of low land on a dead level, densely covered with primeval forests, and annually inundated by the overflow of the mighty river or its tributaries. The forests are rendered wholly impenetrable from the denseness of the underwood, matted together as it is by creeping and climbing plants which form myriads of festoons glowing with nature's brightest tints. The vegetation of the silvas, under the stimulating action of the abundant irrigation, the intense tropical heat, and the inconceivable richness of the alluvium which constitutes the soil, shows an exuberance of growth far surpassing that of any other portion of the earth's surface, and from its very luxuriance presents a bar to civilization no less effectual than do the barren deserts of Africa or the gloomy wastes of central Asia. The few Europeans who have penetrated into this region have sailed up the Amazon and some of its tributaries, and from them we have received the little knowledge that we do possess of this immense tract of wild forest. It is the haunt of innumerable wild animals, especially monkeys and serpents, and of a few aboriginal inhabitants who are sunk in the lowest stage of barbarism.

SILVER (symb. Ag, equiv. 108, sp. gr. 10.53) is a metal which, in its compact state, is of a brilliant white color, possesses the metallic luster to a remarkable degree, is capable of being highly polished, and evolves a clear ringing sound when struck. It is harder than gold, but softer than copper, and is one of the most ductile of the metals. It is malleable, may be hammered into very thin leaves, and may be drawn out into very fine wire, the thinnest silver-leaf having a thickness of only $\frac{1}{100000}$ of an inch, and one grain of the metal being capable of yielding 400 feet of wire. It possesses a high degree of tenacity, a wire with a diameter of $\frac{1}{16}$ of an inch being able to support a weight of nearly 188 pounds. It requires a heat of 1904° F. (1040° C.) to fuse it, and on cooling it expands at the moment of solidification. It is an excellent conductor of heat and electricity, and is not affected by exposure, even to a moist atmosphere at any temperature. When, however, it is fused it absorbs a considerable quantity of oxygen which it expels in the act of solidification with a peculiar sound technically known as *spitting*.* But although it does not rust or become oxidized it usually becomes tarnished on prolonged exposure to the air, owing to the formation of a film of sulphide (or sulphuret) of silver, and this change occurs more rapidly in towns than in the country in consequence of sulphureted hydrogen being more abundant in the atmosphere of the former than of the latter. This metal is unaffected by the hydrates or nitrates of the alkalies, even at a high temperature, and hence silver crucibles, etc., are highly useful in many laboratory operations.

Hydrochloric and dilute sulphuric acid have scarcely any action on silver, but nitric acid and boiling sulphuric acid oxidize it, and form salts; nitric acid being by far its best solvent. Silver has strong affinities for chlorine, bromine, iodine, fluorine, and sulphur, and forms definite compounds with them. It is well known that common salt, especially in the melted state, when left for any time in contact with silver, corrodes that metal, soda being formed from the oxygen of the air, while the liberated chlorine attacks the silver.

Silver is frequently met with in the native state crystallized in cubes or octahedrons, or occurring in fibrous masses. It is also found in combination with gold, mercury, lead, antimony, arsenic, sulphur, etc., and sulphide of lead is almost always accompanied with a greater or less amount of sulphide of silver; it is, however, never found as an oxide.

Silver forms three compounds with oxygen—viz., silver tetrantoxide, Ag_4O ; silver

* Although ordinary air has no oxidizing action on silver, ozonized air rapidly attacks it.

hemioxide or silver oxide, Ag_2O ; and silver peroxide or dioxide, Ag_2O_2 . All these oxides possess the common properties of being reduced by heat to the metallic state, and of being very readily decomposed by the action of light. The oxide, Ag_2O , is the only one of these compounds requiring special notice. It is a dark-brown heavy powder, devoid of taste or smell, slightly soluble in water, to which it communicates a metallic taste and an alkaline reaction. It acts as a powerful base, neutralizing the strongest acids, and forming normal salts with them. It is obtained by the addition of a solution of potash to a solution of the nitrate or any other soluble salt of silver, falling as a hydrated oxide, which, at a temperature above 140°F . (60°C .), becomes anhydrous. If a concentrated solution of ammonia be digested for some hours upon freshly precipitated oxide of silver, fulminate of silver (q.v.), or fulminating silver in the form of a black powder, is produced, and the same dangerous compound is formed when an ammoniacal solution of nitrate or chloride of silver is precipitated by potash.

The salts which the oxide of silver forms with acids are characterized by the readiness with which they decompose, the mere action of light blackening and partially reducing them. None of these salts occur in nature. The following are the most important of those which have been formed artificially:

Nitrate of Silver, AgNO_3 , crystallizes in large, colorless, transparent square tablets, which blacken on exposure to light, or in contact with organic matters, owing to reduction, and dissolve in their own weight of cold water. This property of producing a permanent black color with organic matters has led to its employment as a *marking ink** for linen, etc. The black stains which it forms on the skin, on linen, etc., may be removed by the employment of a strong solution of iodide of potassium, or more readily by a solution of cyanide of potassium. The crystals fuse at a temperature of about 392°F . (200°C .), and the molten mass, when cast into cylindrical molds, solidifies, and forms the sticks of *lunar caustic* which are employed in surgery, medicine, and photography (q.v.). Nitrate of silver is prepared by dissolving pure silver in moderately strong nitric acid, and evaporating till the solution is sufficiently concentrated to crystallize. "The most characteristic test for the salts of silver is the action of hydrochloric acid, or of a soluble chloride, which produces a white curdy precipitate of chloride of silver, insoluble in nitric acid, but readily soluble in ammonia; it is also soluble in hyposulphite of soda, with which it forms an intensely sweet solution; cyanide of potassium also dissolves it; the chloride of silver speedily assumes a violet tinge when exposed to light."—Miller's *Elements of Chemistry*, 2d ed., vol. ii. p. 732.

Of the haloid salts of silver, several occur native. The most important of these compounds is *chloride of silver*, AgCl , which is found native either in cubes or in a dense semi-transparent mass, and is known as *horn silver*, and may be procured as a dense white flocculent precipitate by the procedure described in the preceding paragraph. In consequence of its sensibility to light, it is employed in photography. When heated to about 842°F . (450°C .), it fuses into a yellow fluid, which, on cooling, solidifies into a yellowish-gray semi-transparent horny mass. This salt is insoluble in water and in all the diluted acids, but dissolves in a solution of ammonia, from which it crystallizes in octahedra. Its solution in a solution of hyposulphite of soda is employed in silvering iron, copper, and brass goods. Traces of this salt are found in sea-water, the chloride of sodium probably acting as the solvent. *Bromide of silver*, AgBr , is found in Mexico, where it is known as *plata verte*, or green silver, in the form of small crystals or crystalline granules of a pale olive-green tint. *Iodide of silver*, AgI , occurs native in several Mexican mines in the form of thin, flexible, pearly scales.

Sulphide (or sulphuret) of silver, Ag_2S , is the principal ore of silver. It occurs native, sometimes crystallized in cubes or octahedra, and sometimes in masses. From its gray metallic luster, it has received from mineralogists the name of *silver glance*. It is well known that if silver spoons are allowed to remain in contact with boiled eggs for some time, they become tarnished by the action of the sulphur; a minute quantity of sulphureted hydrogen being probably evolved. The discoloration is easily removed by washing the darkened silver with a solution of cyanide of potassium. Sulphide of silver unites with various other metallic sulphides when fused with them, especially with the sulphides of arsenic and antimony. *Red silver ore*, Ag_3SbS_3 , is a native compound of this kind.

The alloys of silver and copper (see ALLOY and MINT), when cast into ingots, are usually found to differ in their composition in the internal and external parts, in consequence of a molecular change that takes place during the cooling and slow solidification of the molten mass. In bars containing more than 719 parts of silver in 1000, the central portions are richer in silver than the exterior; in alloys of less value, the reverse is observed, while in ingots containing 950 or more parts of silver in 1000, the composition is nearly uniform throughout. When exactly 719 parts of silver and 281 of copper are combined (corresponding to the formula $\text{Ag}_7\text{Cu}_{281}$), no separation whatever of the metals occurs. Many metals, as tin, zinc, antimony, bismuth, arsenic, etc., when

* Brande gives the following directions for preparing marking ink: Dissolve two drams of nitrate of silver and one dram of gum-arabic in seven drams of water, and color the liquid with Indian ink. The cloth must be first prepared by moistening the spot with a few drops of a soda solution, prepared by dissolving two ounces of crystallized carbonate of soda and two drams of gum in four ounces of water. Professor Miller recommends as a cheap indelible marking ink, a solution of coal-tar in naphtha; it resists the action of chlorine, and is used by bleachers to mark their goods.

mixed with silver, render it brittle and unfit for its ordinary uses; they are, however, easily removed in the process of refining. An alloy consisting of 5 parts of silver, 6 of brass, and 2 of zinc, is used as a solder for silver. An alloy of silver and mercury, known as *silver amalgam*, occurs native in a crystallized form. It is a mineral of a silvery white color, and its composition is represented by the formula, AgHg_2 .

Silver, like gold, has been known and prized from the earliest ages. The silver mines of Mexico were, until quite recently, by far the richest known to exist. Their estimated annual yield is about 1,600,000 lbs. troy of the pure metal. Until the remarkable discoveries of silver ore in Nevada and adjoining states in 1859 and 1860, Chili and Peru had long stood next to Mexico in their yield, each furnishing about one-sixth of the produce of that country. Bolivia is also rich in silver; but the recent extraordinary development of silver mining in the western regions of the United States, appears to have raised their produce to at least a par with that of Mexico, so that these two countries now furnish three-fourths of all the silver obtained in the world.

Of European countries, Germany is the most productive. The richest Spanish mines are those of Huelmo, in the province of Guadalupe, which were first extensively opened in 1846. These have yielded immense wealth, but their produce has much declined since 1858. Silver glance is the principal ore, although several others are found, including quantities of the formerly rare mineral freieslebenite, which contains about 23 per cent. of silver. Next to Germany, Spain, France, Austria-Hungary and the United Kingdom yield the largest supplies. The silver mines of Kongsberg in Norway are likewise valuable, and have been long famous. Great Britain has no silver mines, properly so called, but since the introduction in 1829 of Pattinson's process for the desilverizing of lead smelted from argentiferous galena, a large quantity has been annually produced in this way. The highest yield of silver by this process was in 1868, and amounted to 841,328 ounces, but owing to the gradual decline since then in the produce of British lead, the silver obtained from it had fallen in 1880 to 295,518 ounces (see LEAD). In the mineral veins of Cornwall, some "bunches" of true silver ore have occasionally been found, but of limited extent.

The forms in which silver is found in nature are numerous, but we need only notice a few of them. It is frequently found native in crystalized and amorphous masses, which are sometimes of considerable size. One fine piece found at Königsberg is now in the Copenhagen museum, and weighs 500 lbs. But the quantity of silver found in nature in the metallic state is comparatively small. Its principal ores are the different sulphides or sulphurets, viz., silver glance, or sulphuret of silver, containing when pure 87 parts of silver and 13 of sulphur; brittle silver ore, or sulphuret of silver and antimony, of which the composition is, silver 68.5, antimony 14.7, and sulphur 16.4; and red silver ore, called also ruby silver, of which there is a dark and a light kind, the composition of the former being similar to brittle silver ore, but it is a little less rich in silver, and the latter only differs in containing arsenic instead of antimony. The bulk of the silver obtained in Mexico and South America is got from these ores. The only other of much importance, except the mixed ores to be presently noticed, is horn silver, or chloride of silver. In a pure state, it consists of silver 75, and chlorine 25. It occurs extensively in Mexico and Peru, but is not common in European mines.

Beside the ores named above, a good deal of the silver of commerce is obtained from mixed ores, that is, the ores of other metals are frequently found to contain it. In many cases, the amount of silver falls greatly short of one per cent. These ores are for the most part sulphurets of lead, arsenic, copper, zinc, and iron.

In the reduction of silver ores, the processes followed are based upon the fact, that both lead and mercury have a strong affinity for silver. A more recent process depends upon the solubility of chloride of silver in a hot solution of common salt, and its separation again on cooling.

The simplest process is ordinary smelting, and is only applied to the richest ores. These are crushed, mixed with old slag, lead in some form, and a little iron ore and lime. The mixture is then heated in a furnace with charcoal, which brings down the silver and lead together as an alloy. The silver is afterward easily separated by cupellation, the principle of which is described in the article ASSAY; but on the large scale, instead of a small bone ash cupel, a cupellation furnace, say 6 feet in diameter, is used. Here the alloy is melted, bellows are used to remove the lead as litharge, or oxide of lead, and a cake of silver is left on the cupel forming the bottom of the furnace.

It happens that not many even of the richer ores are pure enough to be treated with advantage by simply roasting them with lead; accordingly, another plan, called the amalgamation process, is more commonly adopted. The following is an outline of the way in which this is practiced at Freiberg in Saxony. The vein stuff (largely silica), containing a mixed ore of lead, copper, zinc, etc., as sulphurets, and only from 3 to 3½ oz. of silver per cwt., is ground to powder as described under METALLURGY; but some sulphuret of iron is also present, or must be added. About ten per cent of common salt is then mixed with the ore, and the mixture heated in a reverberatory furnace (q.v.) to a temperature sufficient to expel water, and in part arsenic, zinc, and antimony. After two hours, the sulphur of the sulphurets takes fire, and is burned off as sulphurous acid, or converted into sulphuric acid, so that the metals become oxides and sulphates. The temperature of the furnace is now raised, when the chlorine of the common salt forms

volatile chlorides with zinc, antimony, and iron, and a fixed chloride with silver. During the roasting, the contents of the furnace are continually stirred, so that they ultimately form a coarse powder.

The product of the roasting furnace, after being ground to a fine powder, is mixed in the proportion of 10 cwt. with 3 cwt. of water and 1 cwt. of iron in fragments; the mixture being effected in oak casks, which are then made to revolve for two hours on their axes. During the operation the iron decomposes the metallic chlorides in the roasted ore, forming chloride of iron, while the copper is partly reduced to subchloride and partly to metallic copper. If there is not enough iron present to convert the copper into subchloride, then mercury will be wasted in the next stage by conversion into its subchloride. Quicksilver to the amount of 5 cwt. is next run into each of the casks, which are then set in motion, and continue for 22 hours at the rate of 12 revolutions per minute. The result of this is, that the silver being precipitated by the presence of metallic copper, is then dissolved by the mercury, but the amalgam so formed is usually a complex one.

In order to separate the amalgam from the earthy matters and the sulphates and chlorides, the barrels, which were hitherto only two-thirds full, are now filled with water (the dilution throwing down any chloride of silver held in solution by the sea-salt), and kept revolving for two hours; after which, by means of a stop-cock, the amalgam is allowed to flow into the amalgam chamber, and the rest of the contents, except the iron fragments, into a wash tun. The superfluous quicksilver has next to be separated from the amalgam. This is done in bags of ticking, through which the mercury at first flows readily by its own weight, and is afterward squeezed out on a flat surface. The result of this operation is, that the amalgam of mercury, silver, copper, etc., is left in the bags: its actual composition being nearly 85 per cent of mercury, 10 per cent of silver, and 5 of copper, lead, and antimony. Finally, the quicksilver of the amalgam itself is separated by heat in a distilling furnace. Here the amalgam is put into a row of iron pots, which go into a large retort. When heat is applied the quicksilver volatilizes, and is condensed in a pipe attached to the retort, from which it is collected in a trough. The impure silver left in the retort is refined by fusion and subsequent cupellation.

In another process formerly carried on at Freiberg and elsewhere, the use of mercury is dispensed with. It consists in treating the ore as above described till it leaves the roasting-furnace. At this stage the roasted ore is digested in a warm concentrated solution of sea-salt, which readily dissolves the chloride of silver. The solution is then passed through wooden tubs containing metallic copper, which has the property of decomposing the chloride of silver; the chlorine unites with the copper to form chloride of copper, and the silver is precipitated.

The number of methods which have been used for the separation of silver from its ores and for refining it are far too numerous to include in this article, but many of them are refinements of the methods just described.

In Mexico, where indeed the process was first introduced, the extraction of the silver from its ores is chiefly accomplished by amalgamation, but the plan employed differs a good deal in its details from the Saxon method described above. Of late years the sodium-amalgam process of Mr. Crookes has been used with advantage for the extraction of silver in several American mining districts.

It has now become a common practice at Swansea, where the great British copper-smelting works are situated, to extract the silver which exists in an appreciable, though small quantity, in many copper ores. By one process copper smelted from an argenteriferous ore is melted with three or four times its weight of lead, and cast into ingots. When these are moderately heated, the copper does not fuse, but the lead and silver melt, and run off together, and the silver is then separated by cupellation. From the burnt pyrites of vitriol works, so recently a waste product, not only is the iron and copper, but the silver, which exists in exceedingly small proportion, is now recovered by the use of iodide of potassium.

The physical and chemical properties of silver are such as make it specially valuable for many purposes in the arts; the chief of which are noticed in the articles ALLOY, MINT, PLATING, GALVANISM, and PHOTOGRAPHY. Ordinary mirrors have their *silvering* produced by a coating of an amalgam of tin and mercury; but for some years, mirrors coated by a patent process with real silver, and backed by a layer of some composition, which protects it from the blackening action of sulphureted hydrogen, have been made in great numbers.

MEDICINAL USES OF SILVER. *Nitrate of silver*, in small doses, constitutes an excellent tonic, and it appears to exert almost a specific influence over certain convulsive diseases. As a tonic, it is frequently prescribed in the early stages of phthisis, and in cases of irritability of the mucous membrane of the stomach; and epilepsy and chorea frequently yield to its influence, when many other remedies have been tried in vain. There is unfortunately one great drawback to its administration—viz., that when its use has been continued for some time, this salt communicates a permanent slate-like or bluish-gray hue to the skin. There is very little danger of this change of color occurring, if the medicine is not administered for a longer period than three months. In prescribing this salt, it is usual to begin with a small dose, about one-sixth of a grain, and gradually to

increase it to two or three grains, three times a day. It is best administered in pills made with some vegetable extract. The surgical uses of nitrate of silver have been already noticed in the article on LUNAR CAUSTIC.

Oxide of silver is employed in the same cases as the nitrate. It is especially recommended in chronic affections of the stomach, and in menorrhagia. It may be given in the same doses as nitrate. *Chloride of silver* has been employed both in America and in Germany in the same cases as the nitrate, and in certain forms of syphilitic disease. It is stated not to produce the discoloration of the skin caused by the nitrate; but as the same statement was confidently made regarding the oxide, and was found to be fallacious, we are not inclined to put any faith in this assertion, especially as the nitrate must be at once converted into a chloride by the free hydrochloric acid of the gastric juice. The now great silver-mining industry of the United States had no existence before 1860. While, before that date, it was well known that a few ounces of silver could be extracted from a ton of almost any of the American galena ores; and while silver in combination with lead had been found in some instances, and in Davidson co., N. C., a mine had been worked with some activity for argentiferous galena, and a little silver had been found in the gold of California, there had been no discovery made in this direction which in the least indicated the vast possibilities of American silver production. The prospectors and pioneers who traversed Arizona, Idaho, Nevada, Colorado, and other territories in the far west, seeking for gold, in the years between 1850 and 1860, fell upon silver unexpectedly. The greatest silver mine ever known was discovered in this way in 1858-59, in the Washoe country, on the eastern foot-hills of the Sierra Nevada. This was the celebrated "Comstock" mine, which was found by James Shinney and Henry Comstock, both of whom parted with their interest for a trifle, not discerning the value of the discovery. The Comstock lode is situated in Storey co., Nevada, 25 m. from the w. border of the state, and 20 m. from Reno, on the Union Pacific railroad. A portion of the mine was worked in 1860-61, and by 1865 it had yielded to the value of \$30,000,000; and a city of 20,000 inhabitants was planted on its site. See VIRGINIA CITY. From 1859 to 1866 the total product of the mines on the Comstock lode was about \$70,000,000. The tremendous result of this discovery encouraged further prospecting, and it was soon found that the mountains of Colorado were full of similar veins; Idaho and Montana became in their turn silver-bearing territory; and the Wasatch range, looking down into the Salt Lake valley, was found to be rich in silver-bearing lodes. Up to Dec., 1878, the value of the silver yield of Colorado was about \$16,000,000. Two years later, the mines of Leadville alone, not discovered till 1877, yielded as much. The effect of the increased production of silver has been marked and important. From authoritative sources it is known that the exportation of the metal from countries w. to countries e. of Egypt, which was \$20,000,000 in 1873, had increased in 1877 to \$100,000,000. The mining fever of 1865-70 produced its inevitable result of calamity in 1873, which the discovery of the great "Bonanza" of the California and Consolidated Virginia only temporarily lulled. The interest in silver mines fell off with the bursting of bubble companies, and it was not until the remarkable Colorado discoveries had been fully authenticated in 1878-79, that a fresh enthusiasm brought silver-mining again into repute. See BIMETALLISM; CURRENCY; LATIN UNION; MINING; MINING CORPORATIONS; MONETARY COMMISSION; MONETARY CONFERENCE; MONEY. The following table gives the world's production of silver in 1895 and 1896.

SILVER AGE. See AGES.**SILVER BOW**, a co. in Montana; formed 1884; pop. '90, 23,744; area, 915 sq. m. Co. seat, Butte.**SILVER CLIFF**, a precinct and town in Custer co., Col.; 30 miles s.w. of Canon City; once noted for its great silver interests. Pop. '90, town, 546.**SILVER COINAGE.** See BIMETALLISM.**SILVERING GLASS.** See MIRROR.**SILVERSIDE** or **SILVER-FISH.** See ATHERINE.**SILVER WEDDING.** See WEDDING ANNIVERSARIES.**SIMBIRSK'**, a government of Russia, bounded on the e. by the Volga, and on the w. by the governments of Nijni-Novgorod and Panza. Area, 19,110 sq. m.; pop. '92, 1,667,542. The surface is for the most part level, and the soil of remarkable fertility, and there are excellent and extensive meadows and pasture grounds. There is a variety of manufactures, including ship-building. The fisheries and the commerce on the Volga, and cattle-breeding are important.**SIMBIRSK**, capital of the Russian government of the same name, on the right bank of the Volga 576 m. e.s.e. of Moscow. Leather, soap, and candles are manufactured, considerable trade is carried on by the Volga, and there is a famous annual fair. During the years 1864 and 1865 Simbirsk suffered severely from fires. Pop. '92, 39,723.**SIMCOE**, a co. in Ontario, Canada, lying principally between lake Simcoe and Georgian bay; intersected by the Grand Trunk railroad; area, 1951 sq. miles; pop. '91, 84,828. Co. seat, Barrie. The principal industries are lumbering and shipping.**SIMCOE, JOHN GRAVES**, 1752-1806; b. England, son of a capt. in the navy; killed at the siege of Quebec; was ensign in the army, 1770; a tory during the revolutionary war; raised and commanded the queen's rangers with the rank of lieutenant-col. He was wounded at the battle of the Brandywine and at Monmouth; was with Cornwallis at Yorktown. He wrote the history of the exploits of his battalion; was governor of upper Canada, 1791-94, governor of St. Domingo, 1796-97; lieutenant-gen., 1798; died in England. Lake Simcoe in Ontario was named in his honor. A journal of his campaigns was published for private circulation.**SIMCOE, LAKE**, in Ontario, Canada, having the counties of Ontario and York on the s. shore, Simcoe co. and the river Severn on the north. It is 30 m. long, 18 m. wide, and 170 ft. above lake Huron, into which it discharges through the Severn, lake Couchiching, and Georgian bay. White fish are found abundantly, and on Snake island is an Indian reservation. The margins are covered with thick forests. In the winter it is so solidly frozen as to be a serviceable highway.**SIMEON**, Rev. CHARLES, an eminent evangelical preacher of the English church, was b. at Reading in Berkshire, Sept. 24, 1759. Educated at Eton and Cambridge, he was ordained a priest in 1782. His first religious impressions occurred during his residence at the university, and produced a permanent change in his character. From being a somewhat vain and dressy young gentleman, he passed into an ardent and zealous preacher of the cross, and this he remained during the 54 years of his public ministry.

His career was not marked by many incidents. Appointed vicar of Trinity church, Cambridge, in the year of his ordination, and vice-provost of his own college (King's) in 1790, he continued to hold these offices to the close of his life, Nov. 13, 1836. As a preacher Simeon was distinguished for an impassioned evangelicalism in language, sentiment, and doctrine, that at first roused against him a bitter and protracted opposition. His earnestness, however, met with its due reward. Friends and followers sprang up; and in course of time Simeon became a center of evangelical influence, that began to spread itself over the whole church, and gave birth to its great missionary activity in recent years. Simeon may even be regarded as the founder of the "Low-church" party, and on the whole, fairly represents their earnestness, dogmatism, mediocre intellect, and limited scholarship.

SIMEON STYLITES. See **PILLAR-SAINTS**.

SIMEONI, HIS **EMINENCE GIOVANNI**, Italian Cardinal, was born at Paliano, July 23, 1816, and after his ordination to the priesthood, on account of his learning, was employed in important offices. In 1847 he was auditor of the nunciature of Madrid, and later Prefect of Studies in the Pontifical Lyceum of the Roman Seminary at Rome. He was for many years Secretary of the Congregation of the Propaganda, and belongs to the Holy Roman and Universal Inquisition, and to the Council for the Revision of Provincial Councils and Extraordinary Ecclesiastical Affairs. He was sent in 1875 by Pius IX as Nuncio to Madrid, having just been made Archbishop of Chalcedonia. He was created Cardinal on March 15, 1875, and in 1876, on the death of Cardinal Antonelli, was appointed Secretary of State to the Pope and Prefect of the Sacred Apostolic Palaces. He was succeeded as Secretary of State by Cardinal Franchi in 1878, when he was appointed Prefect of the Propaganda by Pope Leo XIII. Died Jan. 14, 1892.

SIMFERO'POL, a t. of Russia, in the Crimea, capital of the government of Taurida, stands on the Salghir, 45 m. n.e. of Sevastopol. The valley of the river is studded with charming villas, and the town is surrounded by gardens, and has a picturesque appearance. The older part comprises the old Tartar town of Ak-Metchet or White Mosque; the new part, containing the government buildings, is very handsome. Fruits are largely grown in the vicinity, and exported. Pop. (1892) 45,547.

SIM'IA AND SIMI'ADÆ. See **MONKEY**.

SIMILAR FIGURES, in geometry are figures which exactly correspond in shape, but may or may not be of the same size. If the figures be rectilinear, then the criterion of similarity is that every pair of corresponding sides should have the same ratio to each other, and that each angle of the one figure should be equal to a corresponding angle of the other. If the figures be triangular, the proportionality of the sides carries with it the equality of the angles, and *vice versâ*, but only in this case. *Similar segments of circles* are those in which, and on whose bases similar triangles can be inscribed; or as it is otherwise expressed, those which contain equal angles—a satisfactory test that they are each the same part of their respective circles. *Similar solids* are those which are bounded by similar planes similarly situated to each other. All similar plane figures are to one another as the squares of any corresponding sides, and all similar solids are as the cubes of their corresponding sides.

SIMLA, a British district in the n.w. of India, about 170 m. in direct line n. of Delhi. It consists of a number of houses irregularly scattered over a mountain ridge, with a noble panorama expanding on all sides of it. European fruits and vegetables are successfully cultivated, and the climate is salubrious. There are exports of opium, fruit and shawl wool. Area, 18 sq. m. Pop. '81, 42,945.

SIMMS, **WILLIAM GILMORE**, American author, was born at Charleston, S. C., April 17, 1806, of Irish extraction. He made verses at the age of 7; and during the war of 1812, celebrated in rhyme the exploits of the American army and navy. Left in charge of his grandmother at Charleston, he was placed with a druggist; but at 18 began the study of law; was admitted to the bar at 22; published *Early Lays* and *Lyrical and Other Poems* (1827), and became (1828) editor of *The City Gazette*, and published *The Vision of Cortes*, *Cain* and *Other Poems* (1829), and *The Tri-Color*, a poetical glorification of the French revolution (1830). In 1832, his paper, opposing nullification, failed; and he lost his wife, father, and grandmother, and took refuge in New England, where at Hingham, Mass., he wrote his best poem, *Atalanta, a Story of the Sea* (1833); and the same year *Martin Faber*, the story of a criminal. From this time he poured out rather than wrote poems, novels, histories, and biographies in rapid succession, which may best be classed in groups. Of poems, he published *Southern Passages and Pictures* (1839); *Donna Anna* (1843); *Grouped Thoughts and Scattered Fancies* (1845); *Lays of the Palmetto*—ballads of southern heroism in the war with Mexico (1848); *Poems, Descriptive, Dramatic, and Legendary* (1854); *Aretyos, or Songs and Ballads of the South* (1860). Of dramas—*Norman Maurin, or the Man of the People*; *Michael Bonham, or the Fall of the Alamo*; and a stage adaptation of *Timon of Athens*. Of prose romances of the imagination—*The Book of My Lady* (1833); *Carl Werner* (1838); *Confession, or the Blind Heart* (1842); *Castle Dismal* (1845); *The Wiggam and the Cabin*, two series (1845, 1846); *Marie de Bernière* (1853). Of historical romances—*The Yemassee* (1835); *Pelayo* (1838); *Count Julien* (1845); *The Damsel of Davien* (1845); *The Lily and the Totem, or the Huguenots in Florida* (1845); *The Moor and Other Tales* (1855); *Vasconcelos* (1857); *Cassique of Kiawah* (1860). Of revolutionary stories—*The Partisan* (1835); *Mellichamp* (1851); *Katherine*

Walton (1851); *The Scout* (1841); *The Kinsman, or the Black Riders of the Congaree* (1841); *Woodcraft* (1855); *The Foragers* (1855); *Eutaw* (1856); these five being stories of the war in the Carolinas. Of local tales—*Guy Rivers* (1834); *Richard Hurdis* (1838); *Border Beagles* (1840); *Beauchamps* (1842); *Helen Halsey* (1845); *The Golden Christmas* (1852); *Charlemont* (1856). His other works comprise a *History of South Carolina*; *South Carolina in the Revolution*; *Lives of General Marion, Captain John Smith, Chevalier Bayard, General Greene*; *Civil War in the South*; *American Loyalists of the Revolution*; *Views and Reviews of American Literature*; *The Morals of Slavery*, etc. Residing in South Carolina during the war of secession, he sustained the southern cause in a weekly newspaper, and had his house and library wrecked by federal soldiers. Of his various and voluminous works, some are of high excellence. He died in 1870.

SIMODA (Lowland), a harbor of Japan, at the southern extremity of Cape Idzu, and about 80 m. from Yedo, opened to foreign commerce by the Americans in 1854. In 1854 the town was nearly destroyed by an earthquake, while the harbor was so scoured out that hardly any holding-ground was left for ships on the granite bottom. The pop. was formerly estimated at 80,000, but is now reckoned at about 5000.

SIMON, JULES (JULES FRANÇOIS SIMON SUISSE), b. France, 1814; received his education at the colleges of Lorient and Vannes; and was tutor of philosophy in the lyceum of Caen in 1836. He became a disciple of Cousin, who invited him to Paris, and whose place he supplied at the Sorbonne, in the department of the history of philosophy. He was decorated with the legion of honor in 1845, and became a member of the academy of moral and political sciences in 1863. Simon entered into politics in 1846, and was elected a member of the assembly two years later, as a moderate republican. In 1849 he was elected a member of the council of state, but only held the position for a few months, when he went out of office. He refused to take the oath of allegiance to the empire after the *coup d'état*, and his lectures before the Sorbonne were accordingly suspended. In 1863 he was sent to the corps législatif, and soon became the chief of the republican party. In the cabinet of M. Thiers he held the portfolio of public instruction. In 1875 he was elected a member of the French academy. In 1876 he was director of the *Siècle* newspaper, and leader of the republican left in the national assembly; and in that year, called to form a ministry, he became president of the council, and minister of the interior. M. Simon's last official act was his determined opposition to the amnesty bill for the communists, in July, 1880. He was the author of many works on government and philosophy. He died in 1896.

SIMON, RICHARD, a distinguished orientalist and critical scholar, was born at Dieppe, May 13, 1638. Having completed his studies, he entered the congregation of the oratory in 1659, but soon afterward withdrew. He returned, however, in the latter part of 1662. For a time he delivered lectures on philosophy in the college of Juilly; but his studies eventually turned upon theology, oriental languages, and biblical criticism. At one time he thought of entering the Jesuit order, but he remained in the oratory; and it was while still a member of that congregation that he published his well-known work on the doctrine of the oriental church regarding the eucharist, designed as a supplement to the celebrated *Defense of the Perpetuity of the Faith in the Blessed Eucharist*, by Arnaud and Nicole, but criticising that work very severely. This and other controversies to which his later writings gave rise led to his again withdrawing from the oratory in 1678. In that year he retired to Belleville, as curé; but in 1682 he resigned his parish, and lived in literary retirement, first at Dieppe, and afterward in Paris. His health having given way, he returned once again to his native place, Dieppe, where he died in April, 1712. Few writers of his age played so prominent a part in the world of letters, and especially in its polemics. There is hardly a critical or theological scholar among his contemporaries with whom he did not break a lance—Spanheim, Le Clerc, Du Pin, Jurieu, and Jurieu's great antagonist, Bossuet. The principal work of Simon is his *Histoire Critique du Vieux Testament* (Paris, 1678), in which he anticipates the most important conclusions of all the later rationalistic scholars of Germany, and also their method of investigation. For example, he conceives himself to have disproved the Mosaic authorship of the Pentateuch, and assigns its composition to the scribes of the time of Ezra. Other writings of Simon's are: *Histoire Critique du Texte du Nouveau Testament* (Rotterd. 1689); *Disquisitiones Criticæ de variis Bibliorum Editionibus* (1684); *De l'Inspiration des Livres Sacrés* (Rotterd. 1687); and *L'Histoire Critique des Principaux Commentateurs du Nouveau Testament* (Rotterd. 1693), in which he assails the theology of the fathers, and particularly that of Augustine, as a departure from the simple and less rigid doctrines of the primitive church. Among the fathers, his most esteemed authority was Chrysostom. Bossuet replied to this last work by his *Defense de la Tradition et des Saints Peres*. Simon frequently published under assumed names—as his *Dissertation Critique* on Dupin's *Library of Ecclesiastical Writers* under the name of Jean Reuchlin; a work, *Histoire Critique sur la Créance et des Coutumes des Nations du Levant*, under the anagram of Monis; and a *Histoire de l'Origine et du Progrès des Revenus Ecclésiastiques* under the name of Jerome Acosta. No collected edition of his works has ever appeared; in the natural progress of the science of criticism, the most famous of them have lost most of their prestige, and are displaced by recent, and often second-hand, compilations upon the subjects, which, in the days of Simon, were comparatively new and unexplored; but still

there is much to be learned even from such of his works as have been forgotten by ordinary students.

SIMONIDÉS, a celebrated Greek lyric poet, was born at Iulis, in the island of Ceos, in the year 556 B.C., and educated probably with a view to making music and poetry a profession. He left his native island on the invitation of Hipparchus, who, by means of great rewards, induced him to reside at Athens, where also lived at that time Anacreon and Lasus, the teacher of Pindar, although no intimacy seems to have sprung up between Simonidés and his two rivals. It was probably after the expulsion of Hippias (510 B.C.) that he took up his residence in Thessaly, under the patronage of the Aleuads and Scopads, who appear to have treated him in a very niggardly fashion. Shortly before the invasion of Greece by the Persians, he returned to Athens, and employed his poetic powers in the composition of elegies, epigrams, dirges, etc., in connection with that momentous struggle, taking the prize, in regard to the battle of Marathon, out of the hands of his rival Æschylus. In the year 477 B.C., when Simonidés was 80 years of age, he came off victor for the 56th time in a poetical contest at Athens. Shortly after this he went to reside at the court of Hiero of Syracuse, where he died in 468 B.C., at the age of 90. Simonidés appears to have scandalized his contemporaries by writing for hire; and Pindar, his great rival, accuses him, apparently not without good reason, of excessive avarice. His poetry is imbued with a comparatively high morality. He brought to perfection the elegy and epigram, and excelled in the dithyramb and triumphal ode; he seems also to have completed the Greek alphabet by the addition of the double letters and long vowels, and to have invented the art of artificial memory. The characteristics of his poetry are sweetness, polish combined with simplicity, genuine pathos, and great power of expression, although in originality he is much inferior to his contemporary Pindar. The best edition of his fragments is that of Schneidewin, entitled *Simonidis Cei Carminum Reliquia* (Brunswick, 1835).

This Simonidés must be carefully distinguished from the iambic poet SIMONIDÉS of Amorgos, who flourished about 100 years previous to Simonidés of Ceos.

SIMONTON, JAMES W., b. N. Y., 1823; received a common school education in the city of New York; in 1845 entered the city department of a local newspaper as law reporter. He was afterward Washington correspondent of the *New York Courier and Enquirer*. In 1850 he visited San Francisco; and again in 1859, when he was connected with the *Bulletin* and other newspapers, as part proprietor, and also in an editorial capacity. He was employed on the original editorial staff of the *New York Times*; and for a number of years acted as its Washington correspondent. During the war of the secession he was actively engaged as a war correspondent. In 1867 he was appointed superintendent of the associated press, a position which he held till his death in 1882.

SIMONY, in English law, is the corrupt presentation of any one to an ecclesiastical benefice for gift money or reward, and is so called from its resemblance to the sin of Simon Magus. In the canon law it was considered a heinous crime, and a kind of heresy. As the canonical punishment, however, was not deemed sufficient, a statute was passed in the time of Elizabeth, defining its punishment. A simoniacal presentation was declared to be utterly void, and the person giving or taking the gift or reward forfeited double the value of one year's profit; and the person accepting the benefice was disabled from ever holding the same benefice. Presentation bonds, however, taken by a patron from a presentee to resign the benefice at a future period in favor of some one to be named by the patron, are not illegal provided the nominee is either by blood or marriage an uncle, son, grandson, brother, nephew, or grand-nephew of the patron, and provided the bond is registered for public inspection in the diocese. The result of the statutes is that it is not simony for a layman or spiritual person, not purchasing for himself, to purchase while the church is full, either an advowson or next presentation, however immediate may be the prospect of a vacancy, unless that vacancy is to be occasioned by some agreement or arrangement between the parties. Nor is it simony for a spiritual person to purchase for himself an advowson, although under similar circumstances. It is, however, simony for any person to purchase the next presentation while the church is vacant; and it is simony for a spiritual person to purchase for himself the next presentation, although the church be full.

SIMOOM', or SIMOON (otherwise written Simoun, Semoun, Samoun, Samūn), or Sambuli, a name derived from the Arabic *samma*, signifying hot, poisonous, or generally whatever is disagreeable or dangerous, and applied to the hot suffocating winds which are peculiar to the hot sandy deserts of Africa and western Asia. In Egypt it is called *khamsin* (Ar. fifty) because it generally continues to blow for 50 days, from the end of April to the time of the inundation of the Nile.

Owing to the great power of the sun's rays, the extreme dryness of the air, and the small conducting power of sand causing the accumulation of heat on the surface, the superficial layers of sand in the deserts of Africa and Arabia often become heated to 200° Fahr. to a depth of several inches. The air resting on this hot sand becomes also highly heated, thus giving rise to ascending currents; air consequently flows toward these heated places from all sides, and these different currents meeting, cyclones or whirling masses of air are formed, which are swept onward by the wind prevailing at the time. Since the temperature, originally high, is still further raised by the heated grains

of sand with which the air is loaded, it rapidly increases to a degree almost intolerable. In the shade it was observed by Burckhardt in 1813 to have risen to 122° ; and by the British embassy to Abyssinia in 1841 to 126° . It is to the parching dryness of this wind, its glowing heat (about 200°), and its choking dust, and not to any poisonous qualities it possesses, that its destructive effects on animal life are to be ascribed.

The approach of the simoom is first indicated by a thin haze along the horizon, which rapidly becomes denser and quickly overspreads the whole sky. Fierce gusts of wind follow, accompanied with clouds of red and burning sand, which often present the appearance of huge columns of dust whirling forward; and vast mounds of sand are transported from place to place by the terrible energy of the tempest. By these mounds of sand large caravans are frequently destroyed; and even great armies have been overwhelmed by them, as in the case of Cambyzes, who was overtaken by the simoom on his march through the desert to pillage the temple of Jupiter Ammon, and perished with 50,000 of his troops. The destruction of Sennacherib's army is supposed to have been caused by the simoom. The simoom generally lasts from 6 to 12 hours, but sometimes for a longer period.

The effects of this wind are felt in neighboring regions, where it is known under different names, and it is subject to important modifications by the nature of the earth's surface over which it passes. In Italy it is called the *sirocco*, which blows occasionally over Sicily, s. Italy, and adjoining districts. It is a hot moist wind, receiving its heat from the Sahara and acquiring its moisture in its passage northward over the Mediterranean. It is the plague of Sicily and Naples, and while it lasts a haze obscures the atmosphere, and such is the fatigue which it occasions that the streets of Palermo become quite deserted. The sirocco sometimes extends to the shores of the Black and Caspian seas, and under its blighting touch sheep and cattle die in the steppes beyond the Volga, and vegetation is withered and dried up. It is called the *samiel* in Turkey from its reputed poisonous qualities.—The *solano* of Spain is a s.e. wind, extremely hot, and loaded with fine dust, which prevails at certain seasons in the plains of Mancha and Andalusia, particularly at Seville and Cadiz. It produces giddiness and heats the blood to an unusual degree, causing general uneasiness and irritation; hence the Spanish proverb, "Ask no favor during the solano."—The harmattan (q.v.) of Guinea and Senegambia belongs to the same class of winds.

SIMPLE CONTRACT in English law means any contract which is constituted by word of mouth or by a writing not under seal. See **CONTRACT**.

SIMPLON (Ital. *Sempione*), a famous mountain of Switzerland, one of the Lepontine Alps, in the e. of the canton of Valais, and near the Piedmontese frontier, rises to the height of 11,124 feet. The *Simplon road*, one of the greatest engineering achievements of modern times, leads over a shoulder of the mountain from which it derives its name (the *pass of the Simplon*, 6,592 ft.) from Brieg in Valais to Domo d'Ossolo in the n. of Piedmont. The road was commenced in 1800 under the direction of Napoleon and was completed in 1806. It is from 25 to 30 ft. broad. It is carried across 611 bridges, over numerous galleries cut out of the natural rock, or built of solid masonry, and through great tunnels. A movement was commenced in 1889 for a tunnel to be bored through the mountain underneath the pass, and plans were concluded in 1893.

SIMPSON, a co. in s. Kentucky, bordering on Tennessee; drained by Red river and branches of the Big Barren; traversed by the Louisville and Nashville railroad; 320 sq. m.; pop. '90, 10,878, chiefly of American birth, includ. colored. The surface is level and the soil rich; over 1,000,000 lbs. of tobacco are raised yearly; corn, wheat, wool, butter, and sorghum molasses are the other staples. Co. seat, Franklin.

SIMPSON, a co. in s.e. Miss., bordered by Pearl river on the w., and drained by Strong river; 580 sq.m.; pop. '90, 10,188. The surface is level and partly covered with forests of pine; the soil is sandy. The principal productions are cotton, Indian corn, sweet potatoes, and wool. Cattle, sheep, and swine are raised in large numbers. Co. seat, Westville.

SIMPSON, SIR JAMES YOUNG, was b. at Bathgate, Linlithgowshire, in 1811. He early showed a peculiar talent for medical observation and research: and in the prosecution of his professional studies at the university of Edinburgh, so attracted the notice of his teachers as to inspire all of them with an active interest in his future career. He graduated as doctor in medicine in 1832, on which occasion his inaugural thesis won the highest admiration. Prof. Thomson chose him as his professional assistant, and employed him in the preparation of his course of lectures on general pathology. During the illness of the professor, Mr. Simpson supplied his place in the lecture-room with unusual skill and address. He now began professional practice on his own account; and in 1840 succeeded Prof. Hamilton as professor of midwifery in the university of Edinburgh. This position he has held with yearly enhanced distinction, and by the rigidly scientific while popularly attractive character of his prelections, has contributed greatly to the renown of the Edinburgh school, both at home and abroad. He was indefatigable, amid the distracting cares of an extensive practice, in promoting the scientific perfection of his art; and his two volumes of *Obstetric Memoirs*, edited by Drs. Priestly and Storrer, contain the fruits of much patient and ingenious research. The

discovery by which he will be more particularly remembered, however, is that of the anæsthetic virtues of chloroform. The so-called sulphuric ether had been employed in America by Morton to produce anæsthesia during labor; but to Simpson belongs the credit of having, in 1847, first introduced to the scientific world the far safer, more certain, and now universally adopted agent of chloroform. Another innovation which surgical practice owes to Prof. Simpson is the stoppage of hemorrhage by acupressure. In his own peculiar field of obstetrics, his improvements on the old methods of practice are numerous and valuable; while his contributions to antiquarian research would of themselves create an independent reputation in that field. Besides the *Obstetric Memoirs* already mentioned he published a volume on acupressure; and many papers and notices read before the royal and antiquarian societies of Edinburgh. Among these may be enumerated: *Antiquarian Notices of Leprosy; On the Contagiousness of Cholera; Ancient Roman Medicine Stamps; Was the Roman Army provided with Medical Officers?; On Syphilis in Scotland*, etc. His scientific services were recognized by innumerable medical associations; while his professional distinction secured for him a baronetcy in 1866. He died May 6, 1870. A statue of Simpson was erected in Edinburgh in 1877. See the *Memoir by Duns* (1873).

SIMPSON, JOSIAH, 1815-74; b. New Brunswick, N. J.; graduate of the college of New Jersey, 1833, university of Pennsylvania school of medicine, 1836; assistant-surgeon U. S. army, 1837, surgeon, 1855, brevet col., 1865. He served in the Indian war in Florida as surgeon of the 6th infantry, and through the Mexican war, participating in the triumphant entrance into the city of Mexico. He was post-surgeon at Bedloe's island, 1848-55, was assigned to duty on the Pacific coast, and during the war of the secession in the department of the Tennessee. He was attending surgeon in Baltimore from 1867 until his death.

SIMPSON, MATTHEW, D.D., LL.D., b. Ohio, 1810; began the study of German at the age of 8, and the following year read through the German Bible; graduated at Alleghany college, Meadville, Penn., in 1832; took medical degree in 1833; entered the ministry in the Methodist Episcopal church the same year; professor of the natural sciences at Alleghany college in 1837; president of Indiana Asbury university at Greencastle, Ind., 1839-41; appointed editor of the *Western Christian Advocate* in 1848; elected bishop in 1852; visited the Methodist missions in Syria and the east in 1863; the Mexican missions in 1874, and was a delegate to the European missionary conferences in 1875. He was an intimate personal friend of President Lincoln, took a deep interest in the national cause during the war of the secession, and by his zeal and eloquence contributed much to encourage the government in that fearful crisis. He was one of the most eloquent preachers of his day, and had great influence in the Methodist church. He published *One Hundred Years of Methodism*. He d. 1884.

SIMROCK, KARL, a German poet and scholar, who has done more perhaps than any other man to make his countrymen familiar with their early literature, was b. at Bonn, Aug. 28, 1802. He studied at the university of his native city and afterward at Berlin, and in 1823 entered the Prussian state service. His first work was a translation into modern German of the *Nibelungenlied* (Berl. 1827; 9th ed. Stuttg. and Tüb. 1854), followed by a translation of the songs admitted by Lachmann to be genuine, under the title *Zwanzig Lieder von den Nibelungen* (Bonn, 1840). Soon after the publication of his translation of Hartmann von der Aue's *Armer Heinrich* (Berl. 1830), he was compelled to leave the Prussian service on account of a revolutionary poem which he wrote. Afterward he devoted himself exclusively to literature, and more particularly to the early literature of his own country, which he has modernized in splendid style. In 1850 he was appointed professor of German language and literature at Bonn, a situation which he held till his death, which occurred in July, 1876. His principal works, besides those already mentioned, are: *Quellen des Shakespeare in Novellen, Märchen, und Sagen* ("Sources of Shakespeare in Novels, Tales, and Legends," 3 vols. Berl. 1831), executed in conjunction with Eichermeyer and Henschel, but of which the most important part was Simrock's; *Novellenschatz der Italiener* (Berl. 1832); a translation, with commentary, of the poems of Walther von der Vogelweide (2 vols. Berl. 1833), in conjunction with Wackernagel; and of *Wieland der Schmied, Deutsche Heldensage* (Bonn, 1835), one of the freshest of the German mediæval epics; *Rheinsagen aus dem Munde des Volkes und Deutscher Dichter für Schule, Haus, und Wanderschaft* ("Legends of the Rhine from the Mouth of the People and German poets, for School, Home, and Traveling," 4th ed. Bonn, 1850; latest ed. 1857); a collection of German *Volksbücher* ("People's Books"), comprising national proverbs, songs, and riddles, besides a vast quantity of stories (these, carried on for several years, include many vols.); a translation of Wolfram von Eschenbach's *Parzival und Titurel* (Stuttg. and Tüb. 1842); and *Das Heldenbuch*, partly translations and partly original poems (1843-49), illustrative of the heroic traditions of the Teutonic race. A separate collection of his own poems (*Gedichte*) was published at Leipsic (1844, new ed. 1863). Later productions are a translation of the songs of the Edda (Stuttg. and Tüb. 1851, 3d ed. 1863); a *Handbuch der Deutschen Mythologie* (2 vols. Bonn, 1853-55, 2d. ed. 1864); an *Altdeutsches Lesebuch in Neudeutscher Sprache* (Stuttg. and Tüb. 1854); *Das Deutsche Kinderbuch, Reime, Leiden, etc.* (1856-57); *Der Wartburg-Krieg, Herausgegeben, Geordnet, Übersetzt, und Erläutert* (1858); *Die Nibelungenstrophe und ihr Ursprung; Beitrag*

zur Deutschen Metrik (1858); *Lieder vom Deutschen Vaterlande* (1863); *Deutsche Märchen* (1864); *Gedichte Shakespeare's* (1867).

SIMS, CHARLES N.; b. Ind. in 1835. His early life was spent on a farm, and his education obtained at the common schools; began teaching at the age of 17; graduated at the Indiana Asbury university in 1859; elected the same year principal of Thorn-town academy, the leading Methodist institution in Indiana; chosen president of the Valparaiso (Ind.) college; was appointed pastor of Pearl street church, Richmond, Ind.; was subsequently settled at Wabash, Evansville, Indianapolis, Baltimore, Newark, and Brooklyn; was elected chancellor of the Syracuse university in 1880.

SIMS, GEORGE ROBERT, was born in London, Sept. 2, 1847, and was educated at Hanwell College and at Bonn. He joined the staff of *Fun* in 1874, and the *Weekly Dispatch* the same year. His *Dagonet Ballads* appeared first in the *Referee* to which he contributes under the pseudonym of *Dagonet*. His *Social Kaleidoscope*, *Three Brass Balls*, and *Theatre of Life*, contributed to the *Dispatch*, have been translated into various languages. His first play, *Crutch and Toothpick*, was produced at the Royalty Theatre in 1879. His other plays are *Mother-in-Law* and *Member for Slocum*, 1881; *The Gay City*; *Halfway House*; *The Lights o' London*, one of his most popular pieces; *The Romanay Rye*; *The Merry Duchess*, a comic opera; *In the Ranks* (of which he is part author), was produced at the Adelphi in 1883, and ran 457 consecutive nights; *The Golden Ring*, 1888; and *Jack in the Box* and *The Harbor Lights*, written in collaboration, 1885. He also published two novels, *Rogues and Vagabonds*, and *The Ring o' Bells*.

SIMS, JAMES MARION, b. in S. C., 1813; graduated at South Carolina college in 1832; studied medicine at Charleston and Philadelphia; commenced practice at Montgomery, Ala., in 1836. About 1845 he established a private hospital at the latter city for the cure of vesico-vaginal fistula, in the treatment of which he used silver-wire sutures, publishing an account of the operation in the *American Journal of Medical Sciences*, in 1852. He settled in New York city in 1853, and was instrumental, with others, in establishing the women's hospital, for the treatment of diseases peculiar to women. In 1861 Dr. Sims went to Europe, where he performed several surgical operations by invitation, receiving decorations from the French, Italian, Spanish, Portuguese, and Belgian governments. Dr. Sims published volumes on *Trismus Nascientium: Silver Sutures in Surgery*; *On Intra-uterine Fibroid Tumors*, *Clinical Notes on Uterine Surgery*, and was the author of a standard work on female surgery. He was a member of many learned societies in Europe and America, and was president of the American med. assoc., 1876. D. 1883.

SIMSON, ROBERT, a celebrated Scotch mathematician, was b. at Kirton Hall in Ayrshire, Oct., 1687. He was educated at the university of Glasgow with a view to the clerical profession, and attained great eminence in classical and mathematical knowledge. His taste for mathematics gradually gained the ascendancy, and all other pursuits were abandoned. After a brief residence in London, during which he made the acquaintance of Dr. Halley, Mr. Ditton, and others, he returned to Glasgow, where in 1711 he was appointed professor of mathematics, and for 50 years discharged his professorial duties. Simson's reputation rests chiefly on his "restorations," or, as they might more properly be called, "reconstructions," of the Greek geometers. Some good judges are of opinion that he has corrected many errors in the original text, though his respect for the Greek mathematicians always led him to refer these to the ignorance of editors and the negligence of copyists. His first attempt in this direction was to discover the signification of Euclid's porisms, the only datum being a most obscure and tantalizing description of them by Pappus, the indefiniteness of which had foiled both Fermat and Halley. In this difficult task Simson, however, succeeded; and a similar attempt, attended with similar success, on the "loci plani" and the "sectio determinata" of Apollonius, stamped him as one of the most elegant geometers of modern times. With the thorough insight which he had thus obtained into the nature and processes of the Greek analysis, he set himself to the correction of Euclid's *Elements*. This last work was published in 1758, and has deservedly enjoyed a high character; it has been frequently re-edited and republished as a school-book, especially the edition by Playfair. He died 1768.

SIN is the name given by theologians to the evil of human nature, to the moral defect or perversion which appears an inherent quality of the human will, and in a greater or less degree unavoidably characterizes it in this life. It is something more than evil as affirmed of the external world or of the lower creation. *Evil*, as denoting decay or corruption in nature, is admittedly a mere relative term, for in truth decay is just as normal a process of creation as renovation, and corruption is the condition of restored health and beauty. In a similar manner, evil, such as it exists in the lower animal creation, in the form of *prey* and in the forms of pain, of sickness, and of death—whatever be the special view taken of such phenomena—is never reckoned evil in the sense of *sin*. In order to constitute the special idea of sin, it is always necessary to suppose a moral element in the evil to which it is applied. Whatever form of evil is independent of the human will as its source, origin, or agent is not sin. Theologians, indeed, speak of original sin or the sin of human nature, as distinguished from actual sin, or the particular transgression of the individuals composing mankind. According to a common theological view, men are not only sinners individually, but they are partakers of a sinful nature, with which their will has had nothing to do—with reference to which they have

had no choice of good or evil. The evil has come to them by natural descent from the original parents of the race. But even the most extreme view of original sin preserves a hypothetical relation between every individual will and the primal transgression which it considers to be sin, not merely in those who committed it, but in those who have descended from them. All mankind are supposed to have been in Adam, the first sinner, as their representative, so that "they sinned in him and fell with him in his first transgression." Without such a hypothesis of unity between Adam and his race, so that his will was in some measure the typical or representative will of the race, the notion of original sin could not be maintained. For the relation between sin and will as a moral power, having the choice of good and evil, is a cardinal relation without which it would seem impossible to distinguish sin as a quality from other forms of evil in the world.

SINAI, the mount on which, according to the Pentateuch, God announced to Moses the ten commandments and the other laws by which the Israelites were to be bound. Its exact position is matter of dispute among travelers, but it is to be sought for in the mass of granite and porphyry mountains occupying the greater part of the Arabian peninsula, lying between the gulf of Suez and Akabah, and rising to a height of 8,000 or 9,000 ft. above the sea. This mountain-mass is divisible into three groups: a north-western, reaching, in mount Serbal, an elevation of 6,340 feet; an eastern and central, attaining, in Jebel Katherin, a height of 8,160 feet; and a south-eastern, whose highest peak, Um Shauimer, is the culminating point of the whole Sinaitic range. Serbal, with its five peaks, looks the most magnificent mountain in the peninsula, and is identified with Sinai by the earlier church fathers, Eusebius, Jerome, Cosmas, etc.; but it does not meet the requirements of the Hebrew narrative, and even as early as the time of Justinian, the opinion that Serbal was the Sinai of Moses had been abandoned, and to a ridge of the second or eastern range that honor had been transferred, the northern summit of which is termed Horeb; and the southern, Jebel-Mûsa, or mount of Moses, continues to be regarded by the great majority of scholars as the true Sinai. Its height is variously estimated at from 6,800 to 7,100 ft. above the sea.

At the eastern base of Jebel-Musa, in the ravine of Shouaib, stands in solitary peace the famous monastery of mount Sinai; but in earlier times the mountain had numerous other convents, chapels, and hermitages.

SINAITIC CODEX, a very valuable biblical manuscript, discovered in 1859 by Tischendorf in the convent on mount Sinai, and presented by the monks to the Russian emperor Alexander II. A part of it had been consumed in lighting fires, but there still remained 380 leaves, containing a large part of the Septuagint version of the Old Testament with the Apocrypha, and the whole of the Greek New Testament, with the epistle of Barnabas and a part of the Shepherd of Hermas. The leaves are vellum of exquisite fineness and largest size; the writing is in beautiful and simply formed uncial letters, arranged in 4 columns on each page. There are several decisive marks of great antiquity: 1. The little punctuation which it contains is in the oldest manner. 2. Its peculiarities of spelling and etymology belong to the 4th century. 3. It closely resembles the papyrus manuscripts. 4. The order in which it arranges the books of Scripture is known to have been used at the end of the 3rd century. 5. The division of "larger chapters," universal in manuscripts from the 5th c. downward, is wanting in the Vatican and Sinaitic only. The presence of the "Ammonian sections" and "Eusebian canons" is against an earlier date than the first half of the 4th c.; but as these are written on the margin, and in red ink, they may have been added by a later hand. 6. Its readings correspond with those defended by Origen and with some approved by Eusebius. These criteria and the beauty of the manuscript suggest the possibility that it is one of the 50 copies of the Scriptures which Eusebius, by Constantine's command, had prepared on the choicest skins by skillful writers for churches built to commemorate the emperor's conversion. Whether this be true or not, the manuscript certainly belongs to the 4th c., and probably to the first half of it. Tischendorf pronounces it to be of the same age with the Vatican manuscript. Notwithstanding the beautiful writing of the copyist, he did not always copy correctly. His work also has been subjected to many alterations by various revisers, some contemporaneous with himself, some belonging to the 6th or 7th c., and a few to the 12th. In many places even Tischendorf's skill could scarcely trace the original writing under the alteration. As to disputed readings, it omits the last 12 verses of Mark's gospel; John vii, 53-viii. 11; at *Ephesus*, in Eph. i. 1; and the doxology in Matthew's record of the Lord's prayer: has the reading "church of God," Acts xx. 28; "who was manifest," not "God was manifest," 1 Tim. iii. 16; and *God* instead of *son*, John i. 18. The emperor of Russia celebrated the 1000th anniversary of his empire by publishing a splendid edition of this manuscript, of which only 300 copies were printed, 200 being given away, and the others sold by Tischendorf. Several colleges and public libraries in the United States have obtained copies.

SINALOA, or **CINALOA**, a state in n.w. Mexico, bounded on the n. by Sonora, on the e. by Chihuahua, on the s. by Jalisco, and on the w. by the gulf of Mexico and the Pacific ocean; drained by the Culiacan, Cañas, Fuerte, and Sinaloa rivers, intersected by a branch of the Sierra Madre mountains; area, 33,671 sq. m.; pop. '95, 256,414. The surface is mountainous in the e., with gradually sloping plains in the west. There are a number of gold and silver mines. Capital, Culiacan.

SINAPIS. See MUSTARD.

SINCERE BRETHREN, or **TRUE FRIENDS**, is the name of a semi-religious, semi-scientific Mohammedan order, the beginnings of which are shrouded in obscurity, but which, about 970 A.D., manifested its existence by one of the boldest and most comprehensive literary undertakings—viz., an encyclopædic treatment of philosophy, theology, science, ethics, and metaphysics, in a series of no less than fifty-one treatises. Under the head of **MOHAMMEDAN SECTS**, and more especially under **MOTAZILITES**, mention has been made of that immense religious struggle that arose but a few generations after Mohammed, in the bosom of Islam, bringing forth sect after sect; and which, under whatever name and war-cry, simply denoted the reaction of the thinking minds against the dead-weight of dogmas and formulas, such as the successors of the prophet tried in his name, and often enough in direct contradiction to his explicit dicta, to impose upon the faithful. What the Motazilites had attempted was the reconciliation of scientific speculation, as it had irresistibly grown up at the first contact of the Arabs with Greek literature, with the religious dogma of Islam. This new period of development of Arabic culture, which chiefly characterizes the epoch of the first Abbaside rulers, however, was of no long duration. The representatives of the "orthodox" schools, who would not hear of reconciliation, but insisted all the more uncompromisingly upon the most literal interpretation, dexterously used against them those same weapons of dialectics which their adversaries themselves had first taught them how to wield. Setting to work with proper systems and methods, they soon built up a scholastic edifice of theology, not easy to be attacked without the most direct outspokenness; and from this the new schools, the terror of the caliphate strong upon them, shrank. It was thus that the Motazilites soon disappeared from the arena. But their labors had not been in vain. Silently and by small degrees this new and mysterious union of the Sincere Brethren arose. Though widely spread, their schools, their houses of assembly, their rules, their doctrines—everything remained, for we do not know how long, a profound mystery; and apart from that which they themselves have thought fit to reveal of it, neither ancient nor modern investigation has been able to discover many traces of their inner organization and activity. Not even many of their names have come down to us, though the "treatises" they have left point to a multitude of authors, and to many stages of development. The tone of these treatises is much more free, and their entire tendency more radical than that of any of the books of their predecessors. Yet, the desire not to offend the less advanced in religious matters, and above all to reunite rather than to make the breach wider, is perceptible in their endeavor to use what Koranic quotations and traditions can be pressed into the service of free thought, by often very unnatural processes of allegory and mysticism.

Before speaking of the treatises themselves, we shall briefly summarize what can be gathered as to the mutual relations of the brethren of this secret lodge, and the aims of their association. There is special mention made of the "secret doctrine" which the Brethren should communicate to each other in their houses of assembly at those "stated periods," at which no stranger was to be admitted on any condition. The principal subjects toward which their conservation was to be directed were to be the knowledge of the soul or psychology, the knowledge of the action of the senses and the things perceptible through them, the contemplation and investigation of the mysteries of the sacred books, of the prophetic revelations, and the ideas contained in the divine laws. Their attention was further to be directed toward the four "mathematical" sciences—arithmetic, geometry, astronomy, and (musical) composition. But the chief subject of their investigations should be the knowledge of divine things, which are the end and aim of all study. The most catholic spirit was to prevail among them with regard to the various sciences, systems, or books; since "our own system comprises all, without exception, and includes all science." "The speculations of our school extend simply to all things—the sensual and the intellectual—from the moment of their beginning to their end, according to their outer and inner life—that which is palpable and clear about them, and that which is hidden and secret—the truth, in fact. For the true essence in everything is derived from one primeval origin and general cause, since there is but one world and one supreme mind, to which all the most manifold phenomena, species and kinds, and divisions, are to be traced back." With these words, the encyclopædic tendency of the lodge and their essays is best characterized.

All their knowledge they traced back to four sources—as indeed this number seems to have played a very considerable part in all their divisions—as follows: 1. "The books that are known by the names of the sages and philosophers, in as far as they belong to mathematics and natural history." They do not indicate them further; but it is easy to see from the treatises themselves that they allude to the translations of Greek works bearing the names of Pythagoras, Aristotle, Euclid, Ptolemy, Porphyry, etc. 2. "The revealed writings derived from the prophets," such as the five Books of Moses, the Gospel, the Psalms, the Koran, and other writings of prophets who had received their contents through inspiration by the angels and the "deep mysteries hidden in these books." 3. "Books treating of nature"—i.e., that describe and represent the things now in existence—the celestial circles, the motions of the stars, the transformation of matter, the individual species and kinds of animals, plants, etc. All these things point to abstract

ideas and subtle mysteries of which men in general saw but the outside, ignoring the mysterious art and meaning of the Creator hidden within. But if in this third division of the sources, the power of the mysterious and of spiritualism must needs have become very strong, it seems to have ruled absolute in that most mysterious and obscure of all sources, the fourth—viz., “the divine books, or the books on the divine things, written by the angels from the tablet of fate, upon which all the divine decrees regarding the world and man are inscribed. These contain all that refers to substances, species, kinds, and orders of the different souls; their actions, destinies, metamorphoses, phase after phase, the heavenly conjunctures and periods, etc. For this the Koran was quoted: “And upon the Arap” [the division between heaven and hell] “there will stand men, who will recognize every one by their distinguishing mark. These men, however, are souls who take a higher degree than other men, like the prophets and martyrs, or the elect among the believers and learned, or the angels who appear in human shape.” And that there might be no mistake as to the members of the secret brotherhood being alluded to in this passage, another passage from the same sacred volume is adduced, which reads: These are the men who live in houses which God has permitted to be erected, that His name might be praised therein, in which men proclaim his praise both morning and evening, whom even neither commerce nor trade intercourse keeps from the remembrance of God and the solemn fulfillment of the duty of prayer. “This is the state of our brothers, the highly meritorious, the highly honored.”

The supreme (outward) duty of the brethren was to support one another in case of need. Men are divided into four classes—those who have wealth without knowledge; those who have knowledge without wealth; those who have both; and those who have neither. And this at once points to the necessity of mutual support. Envy and ill-will are seriously reprobated, and here the ethical portions of the Koran and the Sunnah are appealed to. But these fundamental principles are further explained and detailed in the rules almost step by step; and it is shown how each of the four classes named is to make its support of the Brethren more effective. Everything should be directed for the benefit of the soul, not of the body; everything for the future, nothing for this world. Moral qualities are the highest gift of heaven, and the characteristic sign of the angels and the blessed in paradise—a wise and happy way of comforting the poor of the community, who, by moral purity, may lift themselves to the same purity as the best and richest among the Brethren. In order further to prove how the soul is capable of the highest perfection by degrees, the various ages and stages of man are enumerated, and the gradual progression of all faculties is dwelt upon according to the “strength of the soul.” The fourth degree is characterized as the angelic quality of the soul, which is obtained at fifty, and which prepares the way to everlasting life, and to the full separation from matter. To this succeeds the “power of ascension,” whereby the member mounts up into the world of the spiritual heavenly beings, so that he foresees clearly the “things of the end,” such as the resurrection, the last judgment, the dispersion, the meting out of rewards and punishments; how, further, “the path is to be crossed, how he escapes the fire, enters Paradise, and becomes a denizen of the highest realms with the Father of all mercies.” And for this consummation, many passages in the Koran and the Gospel are adduced—no less than the words of Socrates on the day of his taking the hemlock; of Pythagoras at the end of his Golden Epistle, etc.

The encyclopædia of treatises which this secret association has left as the monument of its existence was first compiled at Basrah about 1000 A.D.; but has (save one often reproduced chapter, called “The Contest between Man and Animal”) never been printed. The 51 treatises are divided into four classes: 1, the “mathematical,” in 13 dissertations or treatises; 2, the “physical,” in 17; 3, the “origins” of mental activity, or the thinking soul, in 10; and 4th and last, “the divine law,” in 11 treatises, the last of which contains a general outline of the whole work.

The interest attaching to this production, as the earliest encyclopædia deserving the name, reflecting, as it does, the state of science both of the east and west at the end of the first thousand years after the introduction of Christianity, is so great that we append a sketch of the contents and method.

The first 13 treatises, belonging to what may be called the mathematico-philosophical division, treat of arithmetic, geometry, astronomy, geography, music, followed by psychological and ethical reflections. This part concludes with introductions to philosophy and logic. Throughout, the authors only treat of the theoretical part of their subject, without entering into further details as to their practical side, or teaching them systematically one by one.

From these preliminaries the work proceeds to its second part, the physical division, which comprises the whole cosmos in its special phenomena, and the laws that govern them: heaven and earth, the three natural kingdoms, the mysterious union of body and soul, how the latter pervades the former, and communicates itself to all its parts; the changes of life and death, joy and mourning, the senses, and all that is perceptible through them—all the great questions, in fact, which most vitally engage man's attention in this world of growth and decay. An attempt is made to ascertain how far human understanding can penetrate these dim regions of speculation and metaphysics, and even the languages and their original elements are drawn into the circle of these investigations, and subjected to philosophical scrutiny.

The third division treats of the origins of mental activity. Heterogeneous though some of its elements be, it yet keeps its subject sufficiently in view throughout. The elements of mental activity are investigated first according to Pythagoras, then according to the brethren themselves. Next comes man both as microcosm and macrocosm. The revolutions of the heavenly bodies, love, resurrection, the world to come, motion, cause and effect, dogmas, and customs, are then treated of; each and all contributing their share to the aimed-at outward union between reason and faith.

The fourth division borders very closely on the supranaturalistic and purely speculative. At the same time it touches vital doctrines of Islam, and treats them in an abstract and very free manner. How the knowledge of God is gained; the life of the soul after death; the relation of the brethren toward each other; the essence of the true faith; the divine law; prophecy; and the relation of religion generally to the peculiar phase of it as adopted by the lodge; and a number of similar points, are taken up.

So far, in the most general outlines, those 51 treatises, which, though they be neither strictly systematically arranged nor methodized, nor free from repetitions, and by no means so instructive in detail as the enumeration of the contents would lead to believe, yet belong to the most comprehensive and creditable efforts of the human mind.

A small specimen of the manner and method of these treatises, taken from the chapter (20) on plants may not be unacceptable:

"Know that the plants are only perceptible as the visible, palpable phenomena, but that their artistic working within is secret, invisible, and hidden before the eye. It is what we call the part-souls, what the philosophers call the natural powers, what religion calls angels, or divine hosts commissioned with the calling into being and development of the plants and creatures, with the creation of the stones, etc. The terms differ, but the sense and meaning is identical. Philosophers trace these things to the powers of nature; the religious law to the angels, but not directly to the blessed and exalted God. For the blessed God is too exalted to form a natural body himself—to move and to act bodily, just as kings, generals, and high dignitaries are too high to execute any work themselves, though they are considered their authors, through having ordered and willed them. If, e.g., you hear it said that Alexander built Alexandria, you must not, of course, fancy that he himself bodily did build the city—he ordered it to be built. Thus the works of God's servants are traced back to the exalted God, even as the Koran says: 'It is not you who have killed them, but God.'"

One of the most attractive portions of the work, and the one which alone has been repeatedly edited and translated into many languages (not into English), is the so-called "Contest between Man and Animal," which forms a part of the 21st treatise. In this one place alone man and animals are introduced speaking; in all other portions, rhetoric, ornamented by allegories and metaphors, mostly well chosen and artistically wrought, forms the ordinary style. These dissertations may not have fulfilled their purpose any more than did the whole lodge; but they will be all the better appreciated when that darkest period of Mohammedan history, the 10th c., is taken into consideration. Hypocrisy stood for piety at the courts of the many emirs, low cunning for wisdom, the vilest adulation for fidelity, and oppression for justice. No wonder this manly and scientific protest was not received very favorably by so corrupt a generation. Besides which, the want of strict logical arrangement—a circumstance owing probably to the voluntary suppression of the intermediate portion—and the vagueness in which many of the most important points are treated, made even the few independent and faithful minds fail to appreciate it. The chief cause of the discontent which they excited among the contemporaries lay in their conciliatory tendencies. Theology pure and simple would not hear of philosophy. Religion, the orthodox champion said, was a revelation—divinely given, not to be understood even by human intelligence; philosophy, on the other hand, was a vain thing, treating of human things and other futile subjects. The philosophers, though they dared not be quite so outspoken on theology, felt no less keenly that there was no compromise possible under these circumstances, even if they had not repudiated any notion of being "reconciled."

SINDE, an extensive province of British India, lies in the extreme w. of that territory, and is bounded on the n. by Beloochistan and the Punjab, e. by Rajputana, w. by Beloochistan, and s. by the Arabian sea and the Great Western Runn, an extensive lacustrine inlet which separates Sind from Cutch. It is 380 m. in greatest length, 280 in greatest breadth; contains 47,789 (besides a tributary area) English sq. m.; with a pop. '91, of 2,871,744. The sea-coast, which extends n.w. for 150 m., is very low and flat, with the sole exception of the small portion beyond Karachi (Kurrachi), and is studded here and there with low mud-banks formed by the Indus, or with sand hills, the accumulated drift from the beach; it is overflowed at high-tide to a considerable distance inland, and is hardly visible, according to Burnes, at a league from shore. The province is traversed through its whole length by the Indus (q.v.), which, on approaching the coast, divides and subdivides into a number of channels, forming a delta of 75 m. in length by 130 in breadth. This delta, unlike that of the Ganges, is almost wholly destitute of wood, and the soil consists of a mixture of clay, sand, and vegetable mold, which is speedily baked hard by the heat. Along each bank of the Indus is an alluvial tract of great fertility, extending 2 to 12 m. from the river, and mostly irrigated by artificial canals and water-courses, which, overflowing during the inundations, cover the soil with

a silt so rich as to yield two, and sometimes three crops in a year. The soil, nevertheless, contains in the n. so much saltpeter, and in the s. so much salt, that after the year's crops have been obtained, these substances are extracted for home consumption and export. Between the Indus and its most easterly branch, the Narra, is an alluvial "doab," averaging 75 m. in width, but which, from want of irrigation, has become almost a desert. East of this, on the other side of the Narra, is the *Thur*, a desert of shifting sand. West of the Indus the country is occupied by the desert of Shikarpur or the n., a desert not of sand, but of alluvial clay, the same as that of the delta, which only requires irrigation to render it fertile; and in the s. it is traversed by the Hala mountains. The *Thur*, or eastern desert, has numerous vestiges of former towns, in the shape of heaps of fragments of bricks and pottery. The climate of Sind is remarkably sultry and dry, it being completely beyond the action of the s.w. monsoon. There are generally two harvests per annum; the first, or *rubbi* (spring) harvest, consists of wheat, barley, oil-seeds, millet, durra, opium, hemp, and tobacco; the second, or *kurif* (autumn) harvest, of those crops whose ripening requires much heat, as rice, sugar-cane, cotton, indigo, maize. Tigers, hyenas, wolves, foxes, the onagra, wild boars, antelope and deer are abundant. There is considerable fishing, and dried fish are exported. The population consists of a mixture of Juts (a Hindu race) and Beluchis, with a few Afghans in the n.w.; the greater portion of them are Mohammedans, and the remainder, who profess Hinduism, have fallen far from the strictness of observance which characterizes the most of its followers. Generally, the Sindians are tall and handsome; the Beluchi portion of them warlike and independent; the Juts peaceable, and given to agricultural pursuits. The capital of the province is Kurrachi, with a pop. '91, of 105,199.

From the time (711) that Sind was conquered by the caliph, Abd-ul-Melek, it underwent numerous vicissitudes, forming at times a part of the empire of Delhi, and being latterly (1756) joined to Afghanistan. In 1779 the Beluchis rebelled, deposed their ruler, defeated the Afghans (1786), and raised their leader, the chief of the Talpûr tribe, to supreme power. This chief made large grants of territory to various of his relatives, reserving most of lower Sind for himself and his three brothers; so that there were four "ameers" at Haidarabad, three at Khyerpûr, and one or two at Mirpur. The ameers of Sind always regarded the British government with suspicion, and occasionally troubled those traders who visited their dominions; but they subsequently concluded commercial treaties, which were observed with punctuality. On the outbreak of the Afghan war in 1838, the British government intimated its intention to take temporary possession of Shikarpûr, and forced the ameers of Haidarabad and Mirpur to agree to a treaty which virtually destroyed their independence. Their expression of a natural dislike at the mode in which they had been treated, provoked fresh demands from the Calcutta government, to which the Haidarabad ameers agreed, despite the clamors and threats of their followers, who attacked the British residency on the following day. Sir Charles James Napier, the British envoy, at the head of a considerable military force, then marched against the enemy, totally routed them at Meeanee (Feb. 17, 1843), and by defeating the ameers of Mirpur, at Dubba, near Haidarabad (Mar. 24), completed the subjugation of Sind. The conquered territory was divided into three collectorates—Haidarabad, Karatchi, and Shikarpûr; the ameer of Khyerpûr, by continuing faithful to the British, retaining his dominions. For two years afterward, Napier was actively employed in reducing the marauding tribes of the west, who pillaged the province; and so successful was the "Sheitanka bhai" (devil's brother), as the robber tribes named him, that they were completely rooted out of their fastnesses, and most of them transported to distant regions. The country is reported as rapidly improving under its present administration.

SINDHU (from the Sanskrit *syand*, which in its older form probably was *syandh*, to trickle or flow) is the ancient name of the river Indus and the country along the Indus or Sindh.

SINDIA, the name of a powerful family of Mahratta chiefs and princes, which occupies a conspicuous place in the history of India during the 18th and 19th centuries. The founder of the family was RANOJEE SINDIA, a sudra of the Kûmbi ("cultivator") tribe, who from a menial station in the household of the peishwa, rose to a high rank in the body-guard, and after 1743 received in hereditary fief the half of the extensive province of Malwa. His son, MADHAJEE SINDIA (1750-94), joined the Mahratta confederation, and was present at the battle of Paniput (1761), where he was so desperately injured as to be left for dead, but he speedily recovered, and, on the retirement of the Afghans and their allies, repossessed himself of his hereditary dominions. On the death of Mulhar Rao Holkar (q.v.) he became the chief of the Mahratta princes, and had the command of the peishwa's body-guard; and in 1770, the peishwa and his two powerful feudatories, Sindia and Holkar, aided the emperor of Delhi in expelling the Sikhs from his territories, of which the administration was handed over to Sindia, who was now by far the most powerful of the Mahratta chiefs. The murder of the young peishwa by his uncle, Ragoba, and the consequent expulsion of the murderer from the throne he had seized, brought Sindia for the first time into collision with the British, who had espoused Ragoba's cause; but in the war (1779-82) which followed, fortune distributed her favors

with impartiality, and by the treaty of Salbye (1782) Sindia was recognized as a sovereign prince, and confirmed in all his possessions. In 1784 he captured the stronghold of Gwalior, and in the following year marched on Delhi, to restore his preponderance in the councils of the puppet monarch, and subsequently seized Agra, Allyghur, and nearly the whole of the Doab (q.v.). The manifold advantages of European discipline had struck him forcibly during the war with the British, and, with the aid of an able French officer, he introduced it into his own army. An army of 18,000 regular and 6,000 irregular infantry, 2,000 irregular and 600 Persian horse, with 200 cannon, was accordingly raised, and under the leadership of De Boigne, the officer above noticed, reduced Joudpore, Odeypore, and Jypore, three Rajpūt states, and effectually humbled the pride of Holkar.—DOWLUT RAO SINDIA (1794–1827) continued his grand-uncle's policy, and during the troubles which convulsed Holkar's dominions at the commencement of the 19th c., he ravaged Indore and Poona. He was at this time regarded as the most powerful native chief in India. His army virtually held the Mogul emperor a captive at Delhi, and he made himself supreme at Poona. Naturally enough, he thought that the British should apply to him for aid rather than to any other native chief, but it was against the policy of the British to recognize the authority of an irresponsible chieftain, and governor-general Wellesley, who was then commanding in India, was especially averse to such a course, because he knew that Sindia had called in the aid of the French. Sindia was defeated by Holkar in 1802. Later, having joined Bhonsla, the rajah of Berar, in a raid on the nizām (1803), he brought down upon himself the vengeance of the East India company. The confederated Mahrattas were routed at Assaye and Argaum by sir Arthur Wellesley (afterwards Duke of Wellington), the brother of the governor-general; Sindia's disciplined troops, under the command of French officers, were scattered irretrievably at Patpurgunge (near Delhi) and Laswari by lord Lake, and he only escaped total ruin by acceding to a treaty by which all his possessions in the Doab and along the right bank of the Jumna were ceded to the British. Gwalior was, however, restored in 1805, and from this time became the capital of Sindia's dominions. Sindia had been taught by his reverses a useful lesson, and he declined to join Holkar, the peishwa, and Bhonsla, in their attack (1817) on the British, and thus escaped the swift destruction which was visited upon his turbulent neighbors. During the reign of BHAGERUT RAO SINDIA, a minor, the Gwalior dominions were in such a state of anarchy, that the British were compelled to insist on certain guarantees for the preservation of tranquillity; and on these being rejected, a war followed, and the Mahrattas were routed at Maharajpūr (Dec. 29, 1843) by lord Gough, and at Puniaur by maj.-gen. Grey on the same day. Gwalior fell into the hands of the British, Jan. 4, 1844, and Sindia submitted to the conditions demanded of him, besides maintaining a contingent force of sepoys at Gwalior. In 1853 he was declared of age by the East India company, and 1858 he took the field at the head of his own army against the Gwalior contingent, which had joined in the great sepoy mutiny. But the most of his troops deserted him during the battle (June 1), and he narrowly escaped by fleeing to Agra. Sindia was subsequently reinstated by sir Hugh Rose, and received from the British government numerous testimonials of his grateful respect. He was made a knight grand cross of the order of the bath.

SINECURE (Lat. *sine cura*, without care) in common language, an office which has revenue without employment. In the canon law, a sinecure is an ecclesiastical benefice, such as a chaplainry, canonry, or chantry, to which no spiritual function is attached, except reading prayers and singing, and where residence is not required. The strictest kind of sinecure is where the benefice is a donative, and is conferred by the patron expressly without cure of souls, the cure either not existing or being committed to a vicar.

SIN'EW. See TENDON.

SIN-GAN-FOO, a city of China, capital of the province of Shen-See, on the right bank of an affluent of the Hoang-ho. It was formerly the capital of the empire; pop. about 150,000. It is large, inclosed by walls, and is the chief military depot for the northern province of China. A Syrian inscription has been found here recording the introduction of Christianity by the Nestorians in the 4th century.

SINGAPORE, one of the Straits settlements (q.v.), belonging to Great Britain, consists of an island lying off the s. extremity of the peninsula of Malacca, in lat. about 1° 17' n., long. 103° 51' e., and having a city of the same name on its s. side. The island is 27 m. long, and from 11 to 15 broad; area, 206 sq. miles. It is separated from the mainland by a narrow but deep strait, varying from a mile to a few furlongs in width. The surface is generally low and undulating, the greatest elevation (Bukit Timah, or the Hill of Tin) being only 520 feet. According to Malay accounts, a colony was planted on the site of the present town by tribes who are inferred to have been Javanese, from the circumstance that the name Singapura, which they gave to their settlement, is most probably of Sanskrit origin (lion-town); the Javanese being the only people in these seas who have become fairly Hinduized. Be that as it may, in 1818 it was found by sir Stamford Raffles to be an island covered with primeval forests, sheltering in its creeks and rivers only a few miserable fishermen and pirates. It seems to have been unclaimed by any power until 1811, when the sultan of Jahore formally annexed it to his territories. The commanding position of Singapore, in the very center of the highway leading from British India to China, led sir Stamford Raffles to mark it out as the site of the first free port in the Malayan seas; and in 1819 the British flag was hoisted on the new settlement;

although it was not till 1824 that Mr. Crawford concluded a satisfactory treaty with the sultan of Jahore, whereby the island of Singapore, and all the islands within 10 m. of its shore, were given up in full sovereignty to the East India company, on condition of a considerable yearly payment. Since then the prosperity of Singapore has been almost without a parallel. Its position as an entrepôt for the trade of the Malayan archipelago, the Eastern Peninsula and China, and the wise policy that placed the commerce of the new port on an entirely unfettered footing, rapidly established a flourishing trade. In 1823 the imports amounted to £1,200,000; the exports to £920,000. In the year ending April 30, 1865, the value of the imports was \$33,000,000; the exports the same, being fully double the amounts in 1854-55. In 1889 the imports were \$156,199,061; the exports, \$133,219,281.

Notwithstanding the opening-up of more direct communications with Europe of many of the markets in China, Cochinchina, and Siam, formerly largely supplied by traders from Singapore, the commerce has increased, and in 1895 the value of imports was \$157,968,829, and of exports \$135,126,348. The local trade and the exports to the British colonies at the same time showed an increase. The splendid harbor of S. is well sheltered and of easy access, and lying as it does at the converging points of the great trade routes of the East, is visited by a large number of vessels. A savings-bank was established at S. in 1871, and is now managed by a secretary immediately under the colonial treasurer. Under the new postal contract, letters can be delivered in S. twenty-eight days after their leaving England. Singapore is a free port; all commodities are entirely free from duties. The Chinese control the trade in spirits and opium.

The chief articles of export to Europe and North America are gambier, tin, sago, tapioca, black and white pepper, tortoise-shell, sugar, buffalo hides, india-rubber, gum, dye-stuffs, tobacco, nutmegs, gutta-percha, camphor, coffee, sapan-wood, and rattans. Of these, only gambier, sago, and nutmegs are produced on the island to any important extent, all the other articles being imported, chiefly by natives, from other quarters. From Europe large imports are received of cotton manufactures, metals, hardware, earthenware, arms and ammunition, opium, rice, tea, coffee, cigars and tin. Large fleets of prahus are wafted by the southerly monsoon toward this great center of trade, laden with the numerous products of the Indian archipelago, to return again laden with the manufactures of Europe. In 1876, 2149 vessels, of 1,454,689 tons, entered the port; and 2182, of 1,428,992 tons, cleared. In 1880, 2120 vessels, of 1,693,096 tons, entered at Singapore; 1728 steamers, of 1,359,913 tons, cleared—besides 4657 coasting craft entered and 4694 cleared. In 1893, 4435 ships, of 3,519,063 tons, entered and cleared the port. In 1880 the local revenue of Singapore was \$278,475, the expenditure being \$288,685. In 1895 Singapore paid \$2,290,642 towards the revenue of the colony. Education is being steadily advanced in Singapore and a zealous desire on the part of the Eurasians to learn English is now observable.

By act of 1895, the silver Mexican dollar, weighing 417.74 grains, and .9027 fine, was made the standard coin. The Chinese pecul, of 133½ lbs. avoirdupois, which is divided into 100 catties, is the standard of weight. The population of Singapore is perhaps the most heterogeneous in the world, comprising at least 16 nationalities, speaking different tongues. The Malay, however, soft and easily acquired, is the recognized medium of communication between all classes. The population, which is increasing, amounted in 1871 to 97,111, of whom 61,752 were in the town of Singapore and its environs, 31,235 in the country, and 4124 on board of vessels. According to the census report for 1891, the population of the island was 184,554, of whom 5254 were Europeans and Americans. The most numerous elements in the population were: Chinese, 121,908, Malays, 35,992, and immigrants from India, 16,035. Of the aboriginal inhabitants of the island not a trace remains; but similar tribes are still to be found in small numbers in several parts of the peninsula. Of the native population, the Chinese are the most useful part; they form almost the only body of trustworthy native merchants, in the proper sense of the word, and are freely trusted to large amounts by European importers; and it may be doubted whether, as a commercial body, they are, on the whole, more deficient in morality than many European communities. The laws are those of Great Britain, with some modifications; the court is that of a recorder. The governor of the Straits settlements (lieut.-col. sir C. H. B. Mitchell, G.C.M.G., 1895), is assisted by an executive and legislative council. Singapore is the seat of government for the Straits settlements (q. v.), which, on April 1, 1867, were transferred from the control of the Indian government to that of the secretary of state for the colonies.

The city of Singapore, which had, in 1891, 160,000 inhabitants, is situated at the mouth of a small river, on the Singapore side of the island. It is the seat of government for the whole of the Straits settlements. Its appearance is of a mixed oriental and European character; the streets are generally wide, and kept in good order. The European quarter contains several hotels, an esplanade, a Gothic cathedral, and mission buildings. Fort Canning stands on a hill on the left bank of the Singapore river, and on another hill is the governor's palace. Among the other important features of the city are the Raffles museum, with a library, the botanical gardens, and the numerous Buddhist temples of the Chinese. There is an efficient police, and the sanitary arrangements of the town are good. The municipal council consists of public officers and ratepayers.

Singapore possesses two fine harbors; one opposite the town, which, although little more than an open roadstead, is a safe and convenient anchorage, where ships load and discharge by means of lighters; the other is about 3 m. w. of the town, and is land-

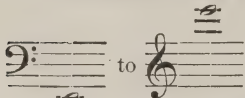

locked, and capable of admitting the largest vessels. Along its shores, extensive wharves have been erected by steam companies and individual merchants; and it is probable that when communication by railway with the town is established, the old harbor will be little used. There are several fortifications commanding the harbor and roads, but the increasing commercial and political importance of the place calls for a still stronger naval and military station. Singapore being within 80 m. of the equator, has little or no variety of seasons; the climate, although hot, is healthy; the temperature ranges from 71° to 92°; rain falls more or less on 200 days of the year, and the extent of the fall is about 87 inches. The soil of Singapore is not fertile, although the climate is such as to cover it with a rich and beautiful vegetation. The nutmeg was at one time successfully cultivated, but most of the trees having unaccountably died, this has been abandoned, and husbandry is now confined to the cultivation of the cocoa-nut, the pepper-vine, and gambir plant, and to the raising of sugar-cane and vegetables for local consumption. The curse of Singapore is the tiger. Turtle are abundant on the shores, and form the cheapest animal food in the bazars. — See Thomson's *Journal of the Indian Archipelago*; J. Crawford's *Dictionary of the Indian Islands and Adjacent Countries*; J. Cameron's *Our Tropical Possessions in Malayan India*.

SINGHALESE LANGUAGE. See CEYLON.

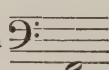

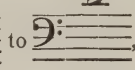

SINGHARA NUT. See TRAPA.

SINGING, the art of producing music from the human voice, generally, though not necessarily, combined with speech. The mechanism of the vocal organs, as applicable to singing, has by some physiologists been likened to a reed, by others to a stringed instrument; in point of fact, the human voice is produced by an apparatus far beyond either in complexity of structure.

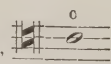

The extreme limits of the voice in respect of pitch may be considered to be from

; but the compass of any individual voice is limited to a portion

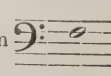

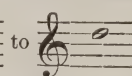

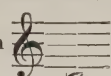

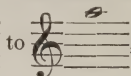

of that range, and voices are classified according to their pitch. Generally speaking, male voices lie an octave below female. The former are divided into *bass* and *tenor*,

the compass of ordinary bass voices being considered to be from  to .

and of tenor from  to . For tenor music, the tenor or C clef is,

generally used, , which has the advantage of having the principal tones within

the staff. When the treble clef is used, the music is written an octave above its true pitch. Female voices are either *contralto* (otherwise called *alto*) or *soprano*, the former

extending from  to , the latter from  to , or some

times higher. Contralto music may be noted either on the treble clef, or on the alto clef, which latter is but the tenor clef placed on the third instead of the fourth line of

the staff . These are the principal divisions of voices; but there are also

further subdivisions. Intermediate between bass and tenor is another male voice, called *baryton*; and intermediate between contralto and soprano, another female voice, called *mezzo soprano*. The ordinary compass of a voice is about twelve notes, but two octaves are not uncommon, and some voices have reached three. Madame Catalani is said to have possessed a voice of three and a half octaves compass.

The notes produced in singing are of two kinds, according as they proceed from the chest voice (*voce di petto*), or head voice (*voce di testa*). The chest notes, or lower register, proceed naturally and readily from the ordinary mechanism of the voice; the upper register, head voice, or falsetto, is produced by a more or less forced contraction of the cavity from which the voice proceeds, imparting to the notes a fife-like character, gentle and weak in the male voice, but often clear and sonorous in the female. It is only in the higher notes of the voice that the falsetto is used, and some notes on the borders of the two registers may be given in either. Where the two registers meet, the tones are apt to be hard and uncertain, or weak; but a cultivated singer will blend the head and chest voice at the point of junction, so as to make the break imperceptible. The notes

of the bass voice are given entirely from the chest. In the tenor, the three or four upper notes belong mostly to head voice. The contralto tones are mostly chest voice, and the upper tones of the soprano are head voice. The alto, when sung, as it often is in England, by male voices, is principally falsetto. See VOICE, SOLFEGGIO.

In singing, the head should be held erect, and the chest well expanded, to allow free play to the lungs and free emission of the voice from the throat. The tongue should be kept still, slightly pressing on the lower teeth. Proper regulation of the breath, and proper articulation of the words, are also matters of essential moment.

One particular requires to be mentioned, in which the notation of songs differs from that of instrumental music. In the latter, two or more quavers or semiquavers may be grouped together by a common line; in singing, this can only be done when the whole group are to be sung to one syllable, and notes belonging to different syllables are always written separately. When notes without hooks, or notes that are not grouped, belong to one syllable, they are bound together by a *slur* placed over them, e.g.:

SINGLE TAX. The form of taxation proposed by Mr. Henry George (q.v.), who would abolish all taxes that fall on industry and economy, and substitute a single tax upon land equal to its rental value exclusive of improvements. This would practically abolish the private ownership of land by making it unprofitable, and substitute ownership by the state. According to the advocates of the theory, the application of the plan would simply take for the state those differential gains from the land which are the result of natural forces, not of the efforts of the producer. The "unearned increment" as represented by the rental value of the land would thus accrue to the benefit of the community as a whole, not to the benefit of private owners as at present. But the actual rental value includes something besides this "unearned increment," namely, profits from improvements made or paid for, by existing owners. The difficulty of separating the economic rent from these profits complicates the question of compensation to present owners and affords one of the grounds of objection to the plan. In *Progress and Poverty* Henry George holds that under the system of private ownership of land, all advantages from improved methods of production are monopolized by the landowner. By abolishing their peculiar monopoly he thinks he would thus be rendering justice to the other agents of production.

SING SING, a village in Westchester co., N. Y.; on the Hudson River and the New York Central and Hudson River railroad; 30 miles n. of New York. It is beautifully located on ground rising 300 feet above the water, at the widest part of the river, and commands a magnificent view of the river, palisades, highlands, and many points of historical interest. It contains the Holbrook and Mount Pleasant military academies, St. John's school, public and school libraries, national and savings banks, electric lights and street railroads, a soldiers' monument, and a section of the Croton aqueduct, which crosses Kill brook by a stone arch with a span of 88 feet and a height above the water of 70 feet, and a second arched bridge beneath the first for highway travel. The industries of the village include the manufacture of steam engines, gas and water pipe, cotton gins, carriages, sleighs, porous plasters, pills, lime, etc. Sing Sing contains many pretty dwellings of New York business men, and is a popular place of summer residence. It is also the seat of one of the state prisons, on account of which many attempts have been made to have the name of the residence portion changed. Pop. '90, 9,352.

SINIGAGLIA, or **SINIGALLIA** (anc. *Sena-Gallia*), a city and sea-port on the e. coast of Italy, in the province of Ancona, and 16 m. w.n.w. of the city of that name, at the mouth of the Misa. Sinigaglia is celebrated for its annual fair, which lasts from July 22 to Aug. 8, and which was formerly one of the most famous in Europe and still has considerable activity. Sinigaglia was founded by the Senonian Gauls, and colonized by the Romans 285 B.C. Pop. '81, 9062; commune, 11,361.

SINISTER, in heraldry, the left-hand side of a shield. As shields are supposed to be carried in front of the person, the sinister side is that which covers the bearer's left side, and therefore lies to the spectator's right. See POINTS OF ESCUTCHEON.

SINKING FUND. The name given to a fund set apart usually by regular accretions for the ultimate purpose of discharging the debt of a government or corporation.

SINOPÉ (Turk. *Sinub*), a t. of Asiatic Turkey, vilayet of Castamouni on the southern side of a little promontory running eastward into the Black sea (185 m. n.e. of Angora). Sinopé, which is defended by some half-ruined fortifications, possesses a dock-yard and naval arsenal; exports timber, dried fruits, tobacco, fish, and skins, and had a population, '89, of 7162 souls. The bay of Sinopé, which affords the finest anchorage for ships along the whole northern coast of Asiatic Turkey, was the scene of a bloody naval engagement, or rather massacre, Nov. 30, 1853, when a Turkish squadron of 13 ships was suddenly attacked and destroyed by the Russian fleet.—Of the ancient city of Sinopé, which was founded by a colony of Milesian Greeks, and, for 200 years

after the Peloponnesian war, was almost the mistress of the Euxine, numerous ruins still exist, "friezes, hundreds of Corinthian columns, capitals, sculptures, inscriptions, and even statues, built up into the walls of its picturesque Byzantine fortifications." Sinope was the birthplace of Diogenes the cynic.

SIN' OPLE, in heraldry (q.v.), the same as vert.

SINTER, the name given by German mineralogists to those rocks which are precipitated in a crystalline form from mineral waters. They are of recent date, belonging in fact to the strata at present in course of formation. Sinter is of various forms, kidney-shaped, knotted, tuberos, botryoidal, tubular, stalactitic, shrub-like, or pronged, and is occasionally distinguished by its chief component, as calcareous sinter, flint or quartz sinter, iron sinter, etc. Calcareous sinter, which is a variety of carbonate of lime, composed of concentric plane parallel layers, appears under various forms; it is deposited with extraordinary rapidity by many springs, a peculiarity frequently made use of to obtain the incrustation of objects with a coating of this substance. Quartz sinter is mostly found in intermittent hot springs, as in the Geysers (q.v.) of Iceland. Iron sinter occurs in old mines, and in coal-beds, where it is formed from iron pyrites through the agency of the atmosphere. The tubular conglomeration of grains of sand half-melted by lightning (*blitz*) is also known as *blitz-sinter*, or *fulgurite* (q.v.).

SINUS (Lat. a bend or hollow) has two significations in anatomy, and one in surgery. The cells or cavities contained in certain bones—as the frontal, ethmoid, sphenoid, and superior maxillary—receive this designation. The frontal sinuses are two irregular cavities extending upward and outward, from their openings on each side of the nasal spine, between the inner and outer layers of the skull, and separated from one another by a thin bony septum. They give rise to the prominences above the root of the nose called the nasal eminences. They are not developed till after puberty, and vary considerably in size, being usually larger in men than in women and young persons, in consequence of the greater prominence of the superciliary ridges in the former. When very much developed they give a receding appearance to the forehead. They are larger in Europeans than in negroes, and are very imperfectly developed in the Australians, whose peculiar want of vocal resonance is apparently due to this deficiency. They communicate on each side with the upper part of the nostril by a funnel-shaped opening, which transmits a prolongation of mucus membrane to line their interior. These cells are much more highly developed in certain mammals and birds than in man. Prof. Owen observes that "they extend backward over the top of the skull in the ruminant and some other quadrupeds, and penetrate the cores of the horns in oxen, sheep, and a few antelopes. The most remarkable development of air-cells in the mammalian class is presented by the elephant; the intellectual physiognomy of this huge quadruped being caused, as in the owl, not by the actual capacity of the brain-case, but by the enormous extent of the pneumatic cellular structure between the outer and inner plates of the skull." The sphenoidal sinuses are two large irregular cavities, formed, after the period of childhood, in the body of the sphenoid bone. They communicate with the upper part of the nose, from which they receive a layer of mucus membrane. Like the frontal sinuses, they serve to lessen the weight of the skull, and to add to the resonance of the voice. The ethmoid sinuses or cells lie in the lateral masses of the ethmoid bone. They open into the cavities of the nose. Their main use is to diminish the weight of the forehead of the skull. The superior maxillary sinus commonly known as the *antrum of Highmore* (the anatomist who first accurately described it) is the largest of the facial sinuses. Its uses are the same as those of the others, and, like them, it communicates with the nasal cavities.

The *sinuses of the dura mater* are quite distinct from the above described bony sinuses; they are irregular channels for the transmission of venous blood, and are formed in the following way: the dura mater consists of two layers—an outer, belonging to the skull; and an inner, belonging to the brain. They can be easily separated in infancy, but in the adult they are blended together for the greater part of their extent. In some places, however, as beneath the sagittal suture (formed by the two parietal bones at the top of the head, and running from before backward), they are separated on either side of the mesial line, the outer layer being continued beneath the bone, and in contact with it; while the inner one dips inward, and meeting with the corresponding layer of the opposite side, forms a triangular canal or sinus, which is strengthened at the sides and angles by interlacing bands of fibrous tissue. The sinus whose formation we have thus described is called the superior longitudinal sinus, and the other sinuses are formed in the same way. They are all lodged in the intervals between the great divisions of the brain, and they are so constructed "that their shape cannot easily be altered by any external pressure; consequently, the flow of blood through them cannot be impeded by the pulsations or pressure of the brain, in the varying positions of the body. The tense, unyielding character of their walls, moreover, does not admit of either collapse or distension; hence, they must be equally full at all times, and must exert a uniform pressure on the brain."—Humphrey *On the Human Skeleton*, p. 200.

In surgery the term *sinus* is nearly equivalent to *fistula* (q.v.).

SION, a small t. of Switzerland, capital of the canton of Valais, in a picturesque situation on the right bank of the Rhone, 17 m. e. of St. Maurice to the n. of the Rhone.

It is defended by walls, towers, and a ditch, and contains a large cathedral, a handsome Gothic town-house, a Jesuits' convent, and an ancient prison. On the n. of the town is a lofty rock, divided into two peaks by a deeply-cut ravine. On the highest peak is the ruined castle of Tourbillon, built in 1294; on the other, the castle of Valeria, now used as a seminary. An excellent wine, called Malvoisie, is made here. Sion is called *Civitas Sedunorum* in a still existing inscription in honor of Augustus, to be seen in the cathedral; in the middle ages it was named *Sedunum*. Pop. '90, 5513.

SIOUT, also *Es Siout* and *Osiât*, the capital of upper Egypt, stands near the w. bank of the Nile, in lat. 27° 12' n. It has several fine mosques, bazars almost as well furnished as those of the capital, some good baths, and one or two well-built houses. Siout manufactures great quantities of the best pipe-bowls. It is a railway terminus. It is the residence of the governor of upper Egypt; the resort of the caravans from Darfur that come by the way of the great oasis, and until recently was the principal seat of the Egyptian slave trade. Pop. '82, 31,575. Siout is built on the site of the ancient Lycopolis, but few remains of the Græco-Egyptian city are extant. From the neighboring heights of the Libyan mountains, which contain numerous rock-sepulchers, the view over the valley of the Nile is, in the opinion of Lepsius, the finest in Egypt.

SIoux, a co. in n.w. Iowa, bounded by Sioux river on the w., which separates it from S. Dakota, crossed by the Chicago, St. Paul, Minneapolis, and Omaha railroad, and drained by Rock river and Willow creek; 768 sq. m.; pop. '90, 18,370. The surface is slightly undulating; the soil is fertile. Co. seat, Orange City.

SIoux, a co. in n.w. Nebraska; 2046 sq. m.; pop. '90, 2452. Co. seat, Harrison.

SIoux, or **DAKOTAS**, are a race or collection of Indians, inhabiting the Dakotas, Nebraska, Wyoming, etc., comprising the Santees, Yanktons, Minikonges, Brulés, Sissetons, Unkpapas, Ogalallahs, Aldewakantons, Wahpetons, and Teton. When found by the French in 1640, near the head-waters of the Mississippi, they were called the Nadowessieux, whence the name Sioux. In 1689 Nicolas Perrot took possession of their country for the French. In wars with the French they were driven down the Mississippi and into the plains of the Missouri. Their territory extended from the Mississippi to the Black Hills, and from Devil's lake to the mouth of the Big Sioux. The American board sent missionaries to the Wahpetons near fort Snelling in 1835, and the Methodists in 1836, who established schools and printed books in their language. In 1837, Sept. 29, the Sioux ceded to the United States all their lands e. of the Mississippi for \$300,000, and in 1851, for \$3,000,000, the lands from Otter Tail lake through lake Traverse to the junction of the Big Sioux and the Missouri, comprising 35,000,000 acres, except a reservation of 200 by 140 miles. The government's neglect to perform its treaties led to hostilities, but the Sioux were defeated by Gen. Harney at Little Blue Water, Sept. 3, 1855, and a treaty of peace was concluded. Subsequently, their annuities being withheld and frauds practiced upon them, they rose and killed nearly 1000 settlers. They were conquered by Gen. Sibley and Gen. Sully; 1000 were captured and 39 hung. Gold having been discovered in the Black Hills in 1868, the United States wished to purchase the tract, and induce the Indians to migrate to the Indian territory. In 1875 Sitting Bull, Red Cloud, and Spotted Tail visited Washington, but refused to sign a treaty; nor were efforts in that direction successful till 1889, when part of their reservation was ceded to the United States. They number about 25,000. See RIGGS, STEPHEN.

SIoux CITY, city and co. seat of Woodbury co., Ia.; on the Missouri river, and the Chicago, Milwaukee, and St. Paul, the Chicago, St. Paul, Minneapolis, and Omaha, the Illinois Central, the Sioux City and Northern, the Sioux City and Pacific, the Sioux City, O'Neill, and Western, and the Union Pacific railroads; 100 miles n. of Omaha. It contains a high school, Morningside college, city normal school, college of medicine, college of music, kindergarten, several German Lutheran and Roman Catholic parochial schools, Samaritan and St. Joseph's hospitals, Women's home for the friendless, boys' and girls' home, babies' home, Y. M. C. A., W. C. T. U., and public library. There are Riverside, Leeds Island, and several smaller parks, U. S. government building, two bridges across the river, electric lights, electric street railroads, water works supplied from driven wells, over 40 churches, and many banks and periodicals. The U. S. census for 1890 reported for Sioux city 196 manufacturing establishments, employing \$5,222,626 capital and 3,008 persons, paying \$1,871,425 for wages and \$10,295,190 for materials, and having a combined output valued at \$14,119,843. The most important industry is slaughtering and meat-packing; the city also has the general shops of several large railroads, and one of the largest linseed oil plants in the country. Pop. '90, 37,806.

SIoux FALLS, city and co. seat of Minnehaha co., S. D.; on the Sioux river, and the Burlington, Cedar Rapids and Northern, the Chicago, Milwaukee, and St. Paul, the Chicago, St. Paul, Minneapolis, and Omaha, the Great Northern, and the Illinois Central railroads; 90 miles n. of Sioux City, Ia. It is the seat of Sioux Falls university (Bapt.), All Saints' school (P. E.), and a Lutheran normal school; of the Protestant Episcopal bishopric of South Dakota, and the Roman Catholic bishopric of Sioux Falls; and of the State school for deaf mutes and the State penitentiary. It has a public and several other libraries, valuable jasper quarries, excellent water-power, and manufactories of woolen and linen goods, etc. Pop. '90, 10,177.

SIPHON is a tube bent so that the two legs are either parallel, or incline at an acute

angle, and is employed to desirable to move. The

Siphon.

draw off liquids from vessels which it is not convenient or principle of this simple and efficient instrument is easy of explanation: let ABC (fig.) be a siphon, with one leg, BC, partially immersed in liquid, and suppose the whole siphon filled with the same liquid; then at A we have the pressure of the atmosphere acting upward into the tube in opposition to the pressure of the liquid in the leg BA; at C we have the pressure of the atmosphere (transmitted through the liquid), and the pressure of the liquid in the vessel outside (which balances an equal height of liquid inside) the tube, acting upward into the tube in opposition to the pressure downward of the liquid in the leg BC. The effective pressures inward at A and C are, respectively, the atmospheric pressure less by the pressure of the liquid in BA, and the atmospheric pressure less by the pressure of the liquid in BD; and as the latter of these two is the greater, it overcomes the other, forces the liquid in the tube out at A, and that in the vessel into the tube at C, the process continuing till the liquid falls

to the level of C (when air is admitted), or of A (when the two pressures become equal). It is evident from the above explanation that when A is on or above the level of D, the surface of the fluid, there can be no flow through the tube; also, that it is quite immaterial whether the longer or the shorter leg be immersed, if only A be below the level of D. If the bend of the siphon be 33 ft. for water, or 30 in. for mercury, above D, the pressure at C, which produces the action of the siphon, becomes the weight of the atmosphere, diminished by an equal weight of a column of fluid, in which case the resulting pressure is zero, and there is no flow through the tube. The flow increases in rapidity and force as the difference of level between D and A increases, and as the difference of level between D and B diminishes. Many siphons have a suction-pump permanently attached to the end of the outer leg for the purpose of exhausting the air inside. Another variety is the *Wurtemberg siphon*, which has two equal legs, the extremities of which are bent upward, so that when the siphon is once filled with fluid, it remains full, and is always ready for use.

SIPHONOSTOMA. See FISH-LOUSE.

SIPHONOSTOMATA, a large group of gasteropodous mollusks, of the order *pectini branchiata*, having the mantle prolonged into a siphon, by which the water enters the gill-chamber. The shell is spiral, the aperture notched or produced into a canal in front, often much produced. To this group belong the families *cypræidæ* (cowries, etc.), *volutidæ*, *buccinidæ* (whelks, etc.), *muricidæ*, and *strombidæ*. They are almost all carnivorous, and move about with considerable activity.

SIPUNCULUS, a genus of *echinodermata*, giving its name to a family, *sipunculaceæ*, and to an order, *sipunculidæ*. The *sipunculidæ*, although ranked among the *radiata*, and having the essential characters of that division of the animal kingdom, resemble the *annelida* in form, general appearance, motions, and habits, as well as in their softer covering, which is leathery and not calcareous, and in the absence of calcareous spines. The *sipunculaceæ* have a retractile proboscis, around the extremity of which is a circle of tentacula, and at the base of it the anus. In the genus *sipunculus* the proboscis is long and cylindrical, with a circle of tentacula near its extremity. *S. Bernhardus* is common on many parts of the British coast, living at the bottom of the sea, at a depth of from 10 to 30 fathoms, and occupying as a habitation the shell of some univalve mollusk, for the protection of its soft wormlike body. It secures the entrance of the shell by a plaster-work of sand, leaving only a hole wide enough for the protrusion of its long flexible proboscis. Other species, instead of sheltering themselves in shells, burrow in the sand. Among these is the **EDIBLE SIPUNCULUS** (*S. edulis*), much esteemed by the Chinese. See *illus.*, **WORMS, ETC.**, vol. XV.

SIR (Fr. *sieur* and *sire*, contracted from *seigneur*; from Lat. *senior*, elder), a term originally corresponding to *dominus* in Latin, and which has come, when appended to the Christian name and surname, to be the distinctive mark of knighthood. It was at one time the practice to use the same title in addressing the clergy, a familiar instance being sir Hugh Evans in the *Merry Wives of Windsor*. To so great an extent did this usage obtain, that a "sir John" came to be a common sobriquet for a priest. "Sir" was here a translation of *dominus*, the term used for a bachelor of arts, originally in contradistinction from the *magister*, or master of arts, but eventually extended to the clergy without distinction. Used along with the Christian name and surname, "sir" is now applied exclusively to knights and baronets. Standing alone, it is a common complimentary mode of address used without much consideration of rank or social status. "Sire" is another form of the same monosyllable, which has been adopted from France as a mode of addressing royalty.

SIR-DA'RIA. See JAXARTES.

SIREN, a genus of perennibranchiate batrachia, of eel-like form, but having two small weak limbs on the fore part of the body. Each foot has four toes. There is no vestige of a hinder pair of feet, nor of a pelvis. The vertebræ are numerous, and each of the vertebræ of the body carries a pair of short ribs. The vertebræ of the tail are compressed, and gradually diminish in size to its tip. The head is flattened, the mouth not deeply cleft, the muzzle blunt, the eyes very small, the ears concealed. The teeth are small; the lower jaw is furnished with them all round; there are none on the upper jaw, but two rows on each side of the palate. On each side of the neck are three gills, each consisting of a short fleshy stalk, supporting a beautiful fringe-like tuft, and water passes from the mouth to the gills through openings as in fishes. But the siren has also lungs, which are long bags, one on each side, beginning behind the heart, and extending almost the whole length of the abdomen. The blood disks are remarkable for their large size, exceeding even those of the proteus. The sirens inhabit the swamps of the Carolinas and other southern parts of North America. They live chiefly in the mud, but sometimes are to be seen swimming in the water, and even make excursions on moist ground. They feed on worms and insects. *S. lacertina* grows to the length of about 3 feet. Its color is blackish. The tail is compressed. The other species are smaller.

SIRÈNE, an instrument for the production of musical sounds in such a manner as to enable us to discover their ultimate nature. In the simplest form of sirène a vane consisting of four equal plates, attached to a delicately supported axle, is so fixed in a metal tube as to close it almost completely (with the help of stops), when either pair of plates is perpendicular to the axis of the tube. When air is forced from a bellows through a pipe, it gives the vane a rotation, and thus produces a current which is interrupted four times in each revolution. In other words, four times in each revolution the air escapes freely, giving rise to a sound. While the vane revolves slowly, the ear distinguishes these successive puffs; but when the revolutions are more numerous than about five per second, the successive puffs cannot be distinguished, and the recurrent sounds are merged into a uniform note, whose pitch rises (i.e., it becomes more and more shrill) the faster the vane revolves. Such an instrument works well when driven by water instead of air. What it shows is, that musical sounds consist of the repetition, at equal very small intervals of time, of some definite noise. By turning the vane by means of a train of wheels, so as to give it a definite rate of rotation, the number of such repetitions per second, necessary for the production of a given musical note, may be measured.

But the sirène of Cagniard de la Tour is much more valuable for such a purpose, as it counts for itself the number of repetitions per second. In principle, it is identical with the simpler instrument just described; but the details of its construction are different. It consists essentially of two circular disks, the upper of which is free to revolve so as almost to touch the lower. In each a series of holes is cut, arranged at equal distances in a circle about its axis. Through the holes in the lower (fixed) plate, streams of air are admitted from a bellows, and pass through the corresponding holes in the upper (movable) plate, when the pairs of holes are superposed; but are checked when the upper plate is turned a little, readmitted when the plate turns a little further, and so on. The holes are pierced *obliquely* through the upper plate, so that the issuing stream makes it turn about its axis. The sounds given by this instrument are exceedingly pure (see SOUND), like those of the flute or tuning-fork. The axis of the upper plate carries an endless screw, which turns a light train of wheels (with dials) resembling that of a gas meter, so that when, by proper adjustment of the pressure in the bellows, the instrument gives steadily some definite note, we may observe the number of turns in any number of minutes by watch. The number of puffs is obviously to be found from this by multiplying by the number of holes in the plate, since during one turn any hole in the upper plate has been opposite each of those in the lower plate in succession. Thus we find the number of puffs per second necessary to the formation of any given musical note.

More complex forms, such as Helmholtz's double sirène, have been devised for more recondite branches of the science. See SOUND; also illus., SOUND, fig. 15.

SIRE'NIA, an order of aquatic mammals, allied to the cetaceans, and including the manatees (q.v.) and the dugongs (q.v.).

SIRENS (Gr. *seirênes*, the "entanglers," probably from *seira*, "a cord" or "string") figure in Greek mythology as young maidens, who sat on the shores of a certain island or promontory near the south-western coast of Italy, and sang with bewitching sweetness songs that allured the passing sailor to draw near, but only to meet with death. Homer speaks of them in the plural, but does not specify their number; later writers mention two and three by name, and assigned them various genealogies. Their tenure of life was dependent on the successful exercise of their charms. If any seamen could resist the enticements of their magic music, they were doomed, but Ulysses or the Argonauts alone succeeded in doing so. It is related by Homer, in the *Odyssey*, that when the former in the course of his wanderings approached their perilous home, he, by the advice of the sorceress Circe, stuffed the ears of his companions with wax, and lashed

himself to a mast, until he had sailed out of hearing of the fatal songs. Others say that it was the Argonauts who got safely past, owing to the superior enchantment of Orpheus's singing, whereupon the sirens threw themselves into the sea, and were transformed into rocks. The Latin poets give them wings, and in works of art they are often represented as birds with the faces of virgins, and are provided with musical instruments. There is obviously a close resemblance between the mermaid (q.v.) of northern mythology, and these Græco-Mediterranean sirens. The Loreley of the Rhine is only a river-siren, though a more exquisite enchantress than ever Greek fancy conceived.

SIRINAGUR. See **SERINAGUR.**

SIR-I-PUL, a t. of Afghan Turkistan, 45 m. s.w. from Balkh, in lat. 36° 21' n., and long. 66° 28' e., on a river which loses itself without reaching the Jihoon.

SIRIUS, otherwise called *canicula*, or the *dog-star*, is a star of the first magnitude, the brightest in the heavens, and is situated in the constellation of *canis major*, or the "great dog." It is about 123 billions of miles distant from the earth. See **STARS**. It has long been known to possess a "proper motion" (i.e., an independent progressive motion), which was for a time believed to be in a straight line, but has now been shown to consist of an undulatory progressive motion on each side of a middle line. This motion was investigated by Prof. Peters of the Pulkowa observatory, Russia, on the supposition that its anomalous character was produced by the attraction of some unseen neighbor, and his calculations being completed and verified (on this supposition) by Mr. Safford of Washington, the distance of Sirius from the center of gravity of both was determined to be 1495 millions of miles. In Jan., 1862, Mr. Alvan Clark of New York, chancing to observe Sirius through a powerful telescope, detected a minute star (which had never before been observed) situated at an angular distance of 7" from Sirius representing about 4,300 millions of miles, and it is generally believed that this is the disturber in question. By photometric measurement it has been shown, that, supposing the intensity of the sun's light for unit of surface to equal that of Sirius, it would require 400 suns at the distance of Sirius to send us the light which that star does; and our sun at the distance of Sirius would appear less than a star of the sixth magnitude, and be invisible to the naked eye. The Egyptians called this star Sothis, and at one time its "heliacal rising" (q.v.) was a sure forerunner of the rising of the Nile; while among the Romans it was considered as a star of evil omen, whose appearance above the horizon coincided with (or even caused) the unhealthy and oppressive heats of summer. Hence the origin of the various superstitions regarding the dog days (q.v.), many of which are still current. —The term "dog star" was also applied to Procyon, a bright star in *canis minor*, whose heliacal rising differs only by a few days from that of Sirius.

SIROC'CO. See **SIMOOM.**

SISCO, a common name for several species of small fishes of the genus *argyrosomus*, inhabiting the northern lakes of the United States. They resemble the herrings in form; lower jaw longest, short intermaxillary bones. They rarely attain a pound in weight. *A. clupeiformis* is found in all the great lakes, generally inhabiting shoaler waters, while *A. hoyi* is found only in the deep waters of lake Michigan, from 30 to 70 fathoms beneath the surface. When salted and smoked they are much esteemed.

SISCOWET, *SISKAWITZ*, *Salmo siscowet*, a species of lake trout. It is about five times as long as the head, exclusive of the tail fin; and there is about the same proportion between the length and breadth. The color varies with the feeding ground, and is brighter during the breeding season, as is commonly the case with the family. This species is characteristic of lake Superior, but is found in the deep water of the other great lakes. It is said to have been first scientifically noticed by Prof. L. Agassiz, in 1850. Its average weight is about four and a half pounds, maximum eight pounds. The color of the flesh resembles that of the great lake trout, as well as its texture. It is very much valued, particularly for salting and packing. It spawns in August and September, in deep water, never ascending the rivers.

SISKIN. See **ABERDEVINE.**

SISKIYOU, a co. in n. California, adjoining Oregon; drained by the Klamath river and its branches; 5680 sq.m.; pop. '90, 12,163, chiefly of American birth, with Chinese. Before 1874 the county included part of what is now Modoc county. The surface is mountainous, mount Shasta, the highest peak, being 14,442 ft. high. There are some fertile valleys, where wheat, oats, butter, wool, hay, and cattle are staples. Co. seat, Yreka.

SISMONDI, JEAN CHARLES LEONARD DE, a distinguished historian of Italian descent, was born at Geneva on May 9, 1773. He received his education as a boy at the "college" or high school of his native town. At the due age he was removed to the *auditoire*, or university. Before he had completed his education, the pecuniary reverses of his father made it necessary for Sismondi to do something for his own maintenance, for which purpose he entered the counting house of the eminent firm of Eynard & Co. of

Lyons. Hateful as mercantile pursuits seem to have been to him, he applied himself to his drudgery with all diligence. He became a thoroughly good clerk, and in after life he acknowledged that the practical training had been of incalculable benefit to him. The French revolution sent Sismondi back to Geneva, but the storm following, he took refuge in England, along with his family. Home-sickness soon sent them back to Geneva, but the continuance of political trouble made it impossible to remain there long. In 1795 they bought a small farm near Pescia, in Tuscany, where their narrow circumstances rendered it necessary for Sismondi almost literally to put his hand to the plow. He had now, however, leisure for literature. In 1798 he began to collect materials for his *History of the Italian Republics*. In 1803 appeared a work on political economy, *De la Richesse Commerciale*, in which he writes like a decided follower of Adam Smith, though at a later period, in his *Nouveaux Principes d'Economie Politique* (1819), he abandoned the wiser views of his youth. In consequence, a professorship in this science was in the same year offered to him in the university of Wilna, which he declined. It was in history, however, that his literary forte lay. The 16 vols. of his *Histoire des Républiques Italiennes*, published between 1807 and 1818, placed him in the first rank among contemporary historians, and brought him praise from the most distinguished men in France and Germany. The events of the hundred days occasioned one of the most memorable passages in the life of Sismondi—his interview with Napoleon. In 1813 appeared his *Littérature du Midi de l'Europe* ("Literature of the South of Europe," Eng. by Roscoe, frequently reprinted). In 1819 he began his best and greatest work, the *Histoire des Français*, with which he was occupied until his death. On April 19, of the same year he married Miss Allen, an English lady, whom he had previously met in Italy. This marriage was followed by many happy years, during which Sismondi resided at Geneva, making frequent visits to Pescia and England. His latter days were, however, darkened by the troubles of his native city, in whose politics he took a keen interest. He died June 25, 1842. Sismondi has contributed more to historical literature than any other writer of his time, and the labor which he bestowed on his works has never been surpassed. "Nine times," he says, "have I traversed Italy, and I have visited every place which has been the scene of any great historical event." For twenty years he worked habitually eight hours a day. Both as a worker and as a thinker he was thoroughly conscientious. His mind was to the last open to truth; neither fettered by prejudice nor blinded by self-conceit. At the same time, no one has surpassed him in tenacity of purpose, nor in energy in following it out. His feelings on religious questions were especially intense. Having on one occasion heard a sermon in an English church on eternal punishment, he vowed never again to enter another church holding the same creed; and "never to contribute to spread what the English call their reformation; for by its side Romanism is a religion of mercy and peace." His private character was singularly amiable and benevolent. His whole career is a noble one, full of interest and instruction.—See *Quarterly Review*, Sept. 1843; *Vie et Travaux de Sismondi* (Paris, 1845); see also his correspondence with Mlle. de St. Aulaire (Paris, 1863); and his *Lettres Inédites à Madame d'Albany* (1864).

SISTERHOODS, in the Roman Catholic church, began in the 4th century. Slowly at first, but with great and rapid increase in the 17th and 18th centuries, they became the right arms of charity, and at last organized bulwarks for the preservation and propagation of the church faith by assuming the education of children, and girls especially, of the poor. French authorities classify them into contemplative and active: the former devoted to religious routines, partly of study, of worship of saints, and of such penances and mortifications of the flesh as the barbarous ideas of the times required; the latter, though less beneficent than they have since become, were to some extent devoted to useful works in narrow spheres. The organizations called active, occupied with good works rather than devotions, served in the hospitals which were established in the middle ages by the church. Every convent had its hospital for the poor, and the superior devotedness and good influence of women as nurses led to the establishment of orders of women who devoted themselves to the work. Convent life during many centuries was a fashionable refuge for maidens and matrons, especially in France, whose misfortunes had deprived life of its common hopes, and to whom religious seclusion offered peace, quiet, the satisfaction of doing good, the hope of future reward, and, to a few, headship and authority. The sisterhood devoted to outside beneficence were but a small part of these vast convent establishments, but have continued to multiply, while the purely devotional orders are becoming extinct.

Down to 1840 the church had conferred its sanction upon 164 distinct organizations of sisters. Previous to A.D. 1500 there were 34 orders founded on the contemplative system and 17 active; 1500–1600, 10 contemplative to 13 active; 1600–1700, 54 active and 12 contemplative; and 1700–1840, 40 active and not one other. Since 1840 a considerable number of the most efficient of these active orders have originated, outside of the church or its convents, which have received sanction and ordination after their usefulness had been well established. The following chronological list is only of those institutions of sisters whose mission was in part of beneficence outside of convent walls:

ORDERS OF ACTIVE SISTERS IN THE ROMAN CATHOLIC CHURCH DOWN TO 1840.

Date.	Name of Order.	Date.	Name of Order.
580	Notre Dame de St. Paul.	1633	Miséricorde.
626	Converties.	1636	Miramiones.
1097	Hospitalières Hôtel Dieu.	1636	Filles de St. Généviève.
1207	Canonesses— <i>secular</i> .	1638	Notre Dame de Charité.
1212	Sœurs de Saint Esprit.	1638	St. Joseph Sisters.
1215	Madeleine.	1643	Hospitalières de la Flèche.
1220	St. Elizabeth of Hungary.	1645	Sœurs de St. Agnes.
1265	Merci (third order).	1650	Sœurs de St. Joseph au Puy.
1288	Elizabeth of Hungary.	1650	St. Joseph Sisters.
1290	Sœurs Grises.	1652	Filles de St. Charles Borromeo.
1328	Hospitalières Canonesses.	1652	Providence de Dieu.
1328	"	1650	Sœurs de St. Alexis de Limoges.
1443	Filles de Marthe.	1659	Villeneuve Hospitalière.
1477	Consort à Milan.	1660	Sœurs de St. Thomas de Villeneuve.
1534	Sœurs Angeliques.	1661	Union Crétienne.
1537	Ursulines de Paris.	1662	Enfance de Jésus.
1537	" Parme.	1666	Dames de St. Maur.
1538	Collectines.	1667	Sœurs de la Foi.
1538	Capucines.	1673	Hospitalières de St. Joseph.
1547	Jesuitesses.	1678	Enfant Jésus— <i>educational</i> .
1556	St. Bridget.	1679	Sœurs de Charité d'Evron.
1559	Augustines de St. Catherine— <i>educational</i> .	1683	Dames de la Providence.
1584	Démesses.	1684	Dames de St. Cyr— <i>educational</i> .
1589	Bare-footed Augustines.	1685	Hospitalière de Dijon.
1590	Purification.	1685	Sœurs de l'Ecole Crétienne.
1598	Ursulines of Rome.	1686	Good Shepherd.
1600	Visitation.	1688	Bethlémites.
1601	Congrégation de Notre Dame.	1688	Filles du Bon Pasteur.
1602	Ursulines of Aries.	1698	Sœurs de Charité de Nevers.
1605	" Toulouse.	1699	Sœurs de St. Paul.
1606	" Bordeaux.	1702	Tiers Ordre du Carmel.
1606	" Burgundy.	1703	Filles de la Sainte Trinité.
1610	Compagnie de Notre Dame.	1716	Filles de la Sagesse.
1610	Penitents.	1730	Filles du Bon Sauveur.
1610	Ursulines de Lyons.	1734	Sœurs de Charité de Jauville.
1613	Sœurs de la Doctrine Crétienne.	1739	Hospitalière d'Evremont.
1614	Ursulines de Tulle.	1762	Sœurs de la Providence.
1616	Augustines de la Recollection.	1766	Hospitalière St. Roch Limoges.
1618	Madolennettes.	1775	Sœurs du Saint Sacrement de Maçon.
1619	Ursulines de Dijon.	1805	Ursuline de Chavauges.
1621	Hospitalières of Loches.	1806	Sœurs de St. André.
1621	Retreat.	1807	Dames de St. Sophie.
1622	Ursulines of Foligno.	1807	Sœurs de l'Enfance de Jésus et de Marie.
1623	Presentation—Ursulines.	1807	Sœurs de Sainte Crétienne.
1624	Notre Dame de Charité.	1814	Dames du Sacre Cœur.
1624	Notre Dame de Refuge.	1820	Sœurs de St. Joseph, Lyons.
1625	Congrégation de la Croix.	1820	Sœurs de la Providence, Maine.
1629	St. Vincent de Paul Sisters.	1820	Sœurs de la Providence de St. André.
1630	Congrégation de la Miséricorde de Jésus.	1824	Dames de Lorette.
1630	Filles de la Providence et de l'Union Crétienne.	1827	Notre Dame de Bon Secours.
1630	Presentation.	1840	Petites Sœurs des Pauvre.

Persons who have not been through the great hospitals of Europe are unaware of the extent of the work of the sisterhoods. When these hospitals were under the government of the church instead of the state, the mothers-superior of the sisters of one order or another were supreme managers of the work and attendance on the patients. The Ursulines have been longest and most widely known in this labor; established in 1537 by Angela de Brescia, both in Milan and in Paris, with the intention that the sisters should not be recluses, but live in their own homes and go out to do the work which the superior of the order should point out. But it was found that greater efficiency could be attained by associating in a community, and the order merged into the convent system. The founder inserted in the rules of the order that its members should be free to act according to the need of the age, and that the sisters should be free to so far live among others as to enable them openly to seek out the afflicted and to perform any act of charity which they could find to do. They now labor in nearly every civilized country in the world, but are subject to the government of the Roman Catholic church. The Sisters of St. Vincent de Paul, less ancient, equally renowned for their devotion and self-abnegation, were organized by a priest of that name and formed their first community in Paris in 1633, and systematized the education of their number to specific labors according to individual fitness. No external signs of devotees were required, and no vows for more than a year. Though organized by a priest, he seemed to guard it against absorption into church control, and abolished the system of requiring applicants to hospitals to confess before being admitted. Throughout Europe, but far more in France than elsewhere, the ladies perfected the means of utilizing the latent benevolence around them, and educated to the work poor girls desirous of devoting themselves to it. Christ's hospital, in London, was committed to their charge in 1643, and in 1652 they went in numbers from Paris to Warsaw during a plague in that city. All the operations of housekeeping, as well as nurs-

ing and light surgical work, were practiced, in order to perfect their members for every service that could be rendered. In 1789 the order had 426 houses in France. They were seriously crippled and interfered with by the turbulent reforms of the French revolution, which, in suppressing all monastic and conventual establishments and confiscating their property, deprived the sisters of their communal homes, notwithstanding their communities were excepted in the decrees of suppression. In 1801 Napoleon gave a new civil legal character to the order by a decree of the minister of the interior; since which time there has been no check to their extension. Like members of similar orders they are now known simply as Sisters of Charity. The order was introduced into the United States in 1808 at Emmettsburg, Md., by Mrs. Seton, of New York, but seems to have been more devotional than active in its work there. In 1814 a branch opened in Philadelphia to conduct an orphan asylum for children orphaned by the yellow-fever pestilence. They may be found in nearly all our cities. North France seems a perennial spring of similar organizations, nearly always originating with poor girls or women whose zeal and will to do good attract a cluster of similar spirits to form new organizations with some feature peculiar to the needs around them. The Sisters of the Good Saviour, founded by two poor girls at Caen, Normandy, in 1720, while similar in their first work to the preceding, took also a special interest in the insane, and in 1817-18 were charged by the French government with the care of insane women and afterward of men. They have become specialists in that charity, and in the care and education of the deaf and dumb in France. In 1874 the Caen house of 300 sisters had charge of 1000 insane persons. In Montreal and Quebec a similar work has been committed to the Sisters of Providence. The most remarkable recent organization of Sisters of Charity is the one called "The Little Sisters of the Poor," originated at St. Servan, a village on the n. coast of Brittany, under the guidance of a village priest, Le Pailleur, Marie Augustine, and a few poorest-of-the-poor sewing-girls and old women. They formed practically a band of beggars, but so thorough in their self-abnegation to help others, so quiet and unobtrusively bent on doing good, that by 1842 they had attracted to their work the full sympathy of the community around them, and a wide fame. They were then organized into an order under the church, with the above name, and their organization in many cities has become the almoner of the people always willing to give of their abundance rather than of their time when sure that the gift will reach the needy. Their specialty is rather among the aged and suffering poor than in hospital service, and they make their homes in the midst of the want and squalor which they alleviate. They now have branch houses in the United States, but it is an alien soil to the women who have been so useful in France, and a field less needing them.

An Anglican order of the Sisters of Mercy was founded at Devonport, England, 1845, by Miss Lydia Sellon, who adopted a garb for the vocation; but the sisters were bound by no vows except of obedience to the superior while connected with the organization. It was composed of three classes of workers: those living in community and devoted singly to its active and laborious work; those residing with the community to give minor assistance while living a calm religious life; and married or single women in society who can be relied on to give time to the work. It has a number of branches in England. The sisterhood of St. John the Baptist is another association under the English church, modeled upon the conventual system rather than upon the more practical working models of the modern French Sisters of Charity. There are quite a number of similar societies in England, all established within the past 30 years, of which the Sisters of the Poor, established in 1851, is one of the most active. In the United States the voluntary associations of benevolent ladies, acting by committees, in single church congregations, or by non-sectarian associations, have an expansion and efficiency that enable them to do the same kind of work as the Sisters of Charity, except in hospitals and asylums, where the thorough organization, the devotional zeal, and the trained experience of the professional sisters, is pre-eminently valuable. Dr. Muhlenberg established the Sisters of the Holy Communion in New York in 1845, who have no established garb, are required to be between 25 and 40 years old, to enter with the consent of parents or guardians, to labor on probation one year, and who may leave at their own pleasure. This organization has done a quiet but very efficient work in the charge of St. Luke's hospital, New York. There were, 1885, 13 Prot. Epis. sisterhoods in the U. S., having under their control many institutions of charity, reformatories, schools, etc. They have proved useful auxiliaries to the clergy in their work among the poor and degraded. See *illus.*, PRIESTS, MONKS, ETC., vol. XII.

SISTER DORA. See PATTISON, DOROTHY.

SISTERS OF CHARITY. See BROTHERS AND SISTERS OF CHARITY.

SISTOVA, an important commercial t. of the principality of Bulgaria, on the s. bank of the Danube, about 35 m. up the river from Rustchuk. It has several mosques, an ancient and strong castle, where the "peace of Sistova" between Austria and Turkey was concluded in 1791. There is some trade. Pop. (1888), 12,482.

SISUPĀLA is in Hindu legend the sovereign of Cheti, a country situated in central India, who was the enemy of Krishn'a (q.v.), and ultimately was slain by him. The history of this enmity, and the death of Sisupāla, are the subject of the *Sis'upālabādhā* of Māgha. See SANSKRIT LITERATURE.

SISYPHUS, a personage of Greek mythology, whom later accounts make to be the father of Odysseus. He is said to have been founder and king of Ephyræ—afterward Corinth—and both he and his whole house were notorious for their wickedness. He is, however, best known for the punishment which he suffered in the lower world, either for treachery toward the gods, or for his wholesale robbery of travelers, whom, at the same time, he murdered with a huge block of stone. He was condemned to roll an immense boulder from the bottom to the summit of a hill, which, whenever it reached the top, rolled down again, and the task of Sisyphus had to be begun anew.

SITÂ is, in Hindu mythology, the daughter of Janaka, a king of Mithilâ, and the wife of Râma. See **VISHN'U**. The word means literally "furrow," as she was not born in the usual sense of this word, but arose from a furrow when her father was plowing the ground, whence she is also called *Pārthivî* (from *pr'thivî*, the earth). Her history is related in the **RÂMÂYAN'A** (q. v.).

SITKA, or **NEW ARCHANGEL**, the capital and port of entry of Alaska, is a small place of '90, 1188 inhabitants, on the w. coast of the island of Sitka or Baranov, the largest island in the group known as George III's Archipelago; in lat. 57° 3' n., long. 135° 18' west. Sitka was the residence of the governor of Russian America, and had a magnetic observatory. Here the chief establishments of the Russian-American company, incorporated 1799, for fishing and hunting fur-bearing animals, were situated. The company employed 50 ships, and about 850 men, but their privileges expired in 1863. S. has an industrial and a public school.

SITOPHOBIA, or **SITOMANIA**. The repugnance to or refusal of food may range from mere impairment or loss of appetite, or hysterical antipathy to particular viands, to total and prolonged abstinence, as a symptom of delusion or delirium. In the insane, food has been consistently refused for years. During this time the system was, of course (see **FAST**), sustained by compulsory alimentation. The causes of such a course are generally local disease in the organs of digestion, creating disgust and loathing toward food, and associating suffering with the process of nourishment; the fear of death, or the desire for death. The motives assigned for such feelings or resolution vary, of course, as the morbid condition may affect the stomach or the brain; and, according to the mental state predominating, suicide may be courted, or poisoning, drugging, or pollution of aliment may be dreaded. The throat or bowels may be imagined to be hermetically sealed; God or Satan may have imposed abstinence; the body is dead, inanimate, or belongs to another. Absurd as such principles of action may be, they prove inexpugnable to persuasion, or to the pangs of hunger and exhaustion, and require a special course of treatment. The determination may be exorcised by medicine; it may be overcome by commands, threats, bribes; it may be evaded by giving eggs, cocoa-nuts, milk from the cow, and other substances, into which mercury, arsenic, etc., cannot well be introduced; or it may be defeated by placing food in the stomach through the instrumentality of the stomach-pump. There have been epidemics of maniacal abstinence.—Chipley, *American Journal of Insanity*, July, 1859; Browne, *Report Crichton Institution*, 1854.

SITTA. See **NUT-HATCH**.

S'IVA (a Sanskrit word, literally meaning happy, auspicious) is the name of the third god of the Hindu Trimūrti (q. v.) or triad, in which he represents the principle of destruction. The name S'iva, as that of a deity, is unknown in the Vedic hymns, but established as such in the epic poems, *Purânas* and *Tantras*. The worshipers of S'iva (see **S'AIVAS**) assign to him the first place in the Trimūrti, and to them he is not only the chief deity, but the deity which comprises in itself all other deities. Thus, in the *S'iva-Purâna* (see **PURÂN'A**), he is addressed as Brahma, Vishn'u, Indra, Varun'a, as the sun and the moon, as earth, fire, water, wind, etc.; but even in the *Purânas* relating to Vishn'u, his power is exalted in praise, and he is addressed with the utmost awe. The symbol of S'iva is the *Linga* (q. v.), emblematic of creation, which follows destruction. From each of his numerous attributes or characteristics he derives a name or epithet. He has five heads (hence his name *Panchânana*, etc., the five-faced); three eyes (hence his name *Trinetra*, etc., the three-eyed), one of which is on his forehead, and indicates his power of contemplation; and in the middle of his forehead he wears a crescent. His hair is clotted together, and brought over the head so as to project like a horn from the forehead. On his head he carries the Ganges, whose course he intercepted by his hair, when this river descended from heaven, so as to enable the earth to bear its fall (hence his name *Gangâdhara*, etc., the Ganges-bearer). Round his neck he carries a garland of human skulls; and his throat is dark blue, from the poison which he swallowed when it emerged from the ocean, churned by the gods for the attainment of the beverage of immortality, and threatened to destroy the world. In his hands he holds the trident, a club or pole, armed at the upper end with transverse pieces, representing the breastbone and ribs adjoining, and surmounted by a skull and one or two human heads. His weapons are the *Khinkhira*, which is not described, a bow called *Ajakava*, or *Ajagava*, a thunderbolt, and an axe. As the destroyer of the world he is also called *Kâla* (time or death), and represented as of black color. One of his representations is also half-male

and half-female, emblematic of the indissoluble unity of the creative principle (hence his name *Ardhanārīś'a*, the half-female-lord). He is clothed in a deer-skin; or he also holds a deer in one of his hands; or he sits on a tiger-skin, or is clothed in it. When riding his vehicle is the bull Nandi, whom he also carries as an emblem in his banner. He resides on the wonderful mount Kailāsa, the northern peak of the Himalaya, where he also rules over the north-east quarter. His principal wife is *Durgā* or *Umā* (q.v.); his sons are GANES'A and KĀRTTIKEYA (q.v.). One of his principal attendants is *Tan'du*, who is one of the original teachers of the arts of dancing and mimicry, whence S'iva is the patron of the dancers, and is called *Nat'es'wara* (lord of the dancers). Besides Tan'du, a host of other attendants and companions, together with demons and other beings surrounding him, are named by the Purāṇas.

Amongst the principal achievements of this god is his conflict with the god Brahma, who was originally possessed of five heads, but lost one through exciting the anger of S'iva; for the fifth head of Brahma, once disrespectfully addressing S'iva, and even challenging his power, S'iva immediately cut off the offending member with the nail of his left thumb. A similar penalty he inflicted on *Daksha*, his father-in-law, who once performed a great sacrifice, but neither invited his daughter Satī nor her husband S'iva. S'iva, nevertheless, appeared at the sacrifice; but when Satī, offended at the reception she met with, threw herself into the sacrificial flames, S'iva cut off the head of Daksha; and Daksha would have remained headless had not the gods interfered in his favor with S'iva, who, out of compassion, replaced his head by that of a ram. Besides these feats he killed several demons—*Ruru*, *Andhaka*, *Triṇpura*; and he also reduced to ashes *Kāma* (the god of love), who, at the instigation of the gods, undertook to excite the desire of S'iva to procreate a son, but was indiscreet enough to choose for this purpose a time when S'iva was engaged in fierce austerities (see KĀMA). S'iva is especially worshipped under the symbol of the linga; but there are periods at which homage is paid to him also under other forms corresponding with the description given above. Hindu mythology knows, properly speaking, no incarnations of S'iva like those of Vishn'u; in some writings, however, some of his forms, especially that called Bhairava, and that called Virabhadra, are considered to be his sons or incarnations. S'iva, like Vishn'u (q.v.), has 1000 names by which he is addressed; some derived from his exterior attributes have been mentioned before; among the rest the principal are *Is'a* or *Is'wara* (lord); *Mahes'a* or *Mahes'wara* (the great lord); *S'ankara* (the conferrer of happiness); *Rudra* (the terrible); or *Mahārūdra* (the very terrible); and *Mahādeva* (the great god). For his worshippers, see S'AIVAS.

SIVAS, a city of Asiatic Turkey, capital of the vilayet of the same name, is situated on the Kizil Irmak (anc. *Halys*), 60 m. s.e. of Tokat. Sivas covers a large extent of ground, is well built, has numerous old mosques, khans, gardens, and excellent bazaars, manufactures coarse woollens, and carries on a considerable transit trade. Pop. 20,000, of whom about 5,000 are Armenians, the rest Turks. Sivas is built on the site of the ancient *Sebasteia*, from which it derives its name.

SIVASH', or PUTRID SEA. See CRIMEA.

SIVATHE'RIMUM (*Siva*, an Indian god; and Gr. *therion*, a wild beast), a remarkable genus of extinct mammals, found in the miocene strata of the Sewalik hills, in northern India. It had a large skull nearly as long as that of an elephant, supported on a neck little short of that of a giraffe, but much stronger. The face was short, and the nasal bones were prolonged into a pointed arch above the external nostrils, indicating the existence of a trunk or proboscis, an organ unknown among the Ruminantia to which it belonged.

SIWAH, or EL-SIWAH. See AMMONIUM.

SIX COMPANIES, THE CHINESE, are six organizations formed by Chinamen residing in the United States, representing six divisions of the Chinese province of Quang Tung (Canton), their object being to take care of Chinamen coming from those divisions, so that the immigrants may deal with men who speak their dialect and may meet persons from their own home localities. They are partly benevolent and partly commercial societies, their function being to loan money, give advice, act as bankers, care for the sick, and protect their countrymen in all ways. Their strongest claim upon the regard of their countrymen was originally to bring back, dead or alive, the body of every Chinaman who sailed from home to this country. At the outset the business of those companies was small. They began through the operations of the American agents of a Hong Kong firm. That was in 1850 and 1851, and their first work was in hiring men in China to meet the demand for labor in California. The business grew and other Chinese firms went into it. Then the agents of all these firms found it necessary to unite for self-protection, partly to hold the business among themselves and partly to protect themselves against trickery on the part of the coolies who were in debt to them. There were six of these agencies, and they called themselves the Six Companies. They make money from the fees paid for each laborer who seeks their protection, but the fees are paid by the contractors who hire labor of them or who order Chinamen brought to these shores—to the United States formerly, and now to Canada. The names of the Six Companies are, in the order of their size and importance, the Ning Yeung, twice larger than any other; the Hop Wo, the Kong Chow, the Yung Yo, the Sam Yip, the Yang

Wo. They are secret societies only from the point of view of the ignorant; to the rest they do not differ widely in their main design from the societies which the white men themselves established in California during the gold fever, when people from every State in the union had their headquarters there. The Chinese have added arbitration bureaus and banking operations to the original scheme of their companies.

SIX NATIONS. See IROQUOIS.

SIXTUS, the name of five popes, of whom two call for particular notice, Sixtus IV. and Sixtus V. The former (originally named Francesco della Rovere), b. July 22, 1414, was a native of a small village near Savona, and a member of a very humble family. He was a scholar of the celebrated cardinal Bessarion, and became a member of the Franciscan order, in which capacity he obtained the highest reputation throughout Italy as a preacher. On the death of Paul II. in 1471, Rovere was elected to the Roman see. The domestic government of Sixtus has been strongly condemned. His inordinate partiality to his relatives exhausted the papal treasury, and led to many questionable exactions, and to gross abuses in the dispensation of church patronage. His excessive facility, too, in dispensing favors, led to his not unfrequently conferring the same benefice on more than one individual. But the worst imputation upon the memory of his pontificate arises in connection with the political affairs of Florence, and especially with the conspiracy against the Medici family, known in history as the Pazzi conspiracy. In the last act of this nefarious plot, the murder of Giuliano in the church at Florence, Sixtus's nephew, Riasio, was present, and when, after its failure, the leaders, including the archbishop of Pisa, were executed, Sixtus excommunicated the duke Lorenzo and all the magistrates of the city. Although this censure was passed professedly for the violation of the immunities of the church in putting an ecclesiastic to death, yet it has drawn upon Sixtus the suspicion of complicity, or at least of connivance after the fact; and has led to much controversy among historians. The necessities of defense against the Turkish invasion embarrassed still further the finances of the pope, and even the Catholic historians deplore the lengths to which ecclesiastical exactions and the simoniacal distribution of benefices were carried in the latter years of Sixtus. In many respects, nevertheless, his administration was liberal and public spirited. He did much to foster learning and to encourage art. Under him, the Vatican library continued to increase, and he contributed notably to the improvement and decoration of the city. In 1482 he entered into an alliance with the Venetians against the duke of Ferrara, which led to a general Italian war, and ended in a dissolution of the Venetian alliance, so mortifying to the pope, that his death is said to have been caused by chagrin and mortification, Aug. 13, 1484.—**SIXTUS V.**, in many respects, one of the most remarkable of modern occupants of the Roman see, originally named Felice Peretti, was born (Dec. 13, 1521) near Montalto, of parents so poor that his boyhood was spent in the humble occupation of a swineherd. While thus engaged, the boy attracted the notice of a conventual Franciscan father, who procured his admission into the order. He was ordained priest in 1545, and became professor of theology at Siena. His reputation as a preacher led to his being transferred to Rome, where he rose to its first dignities. He accompanied cardinal Buoncompagno as theologian in his legative mission to Spain (1565); and on the accession of Pius V. to the pontificate, was named cardinal (1570). On the accession of his former patron, Buoncompagno, under the name of Gregory XIII., cardinal Montalto might have exercised the highest influence, but he lived a retired and mortified life, and was believed to have fallen almost into the decrepitude of age and infirmity. This appearance was afterward ascribed by his enemies to the design of concealing his ambitious views; and there is a well-known but apocryphal story of his having, when elected pope on the death of Gregory in 1585 (April 24), flung aside his crutch, and revealed himself to the astonished cardinals in the full vigor of his physical strength and his moral character. His pontificate, however, was a most active and energetic one, and was marked by vigorous measures of improvement in every department of administration, ecclesiastical as well as civil. His first care was to repress the prevailing license and disorder of the city of Rome, and of the papal states generally, by effectually breaking up and exterminating the lawless bands of outlaws by which both were infested. His administration, both in this matter and in the repression of immorality, was rigorous perhaps to the extreme of cruelty; but the evil was one which seemed to call for extreme remedies. He reformed the administration of the law, and the disposal of public patronage; and he entered upon numerous and most comprehensive projects for the moral and material improvement of Rome. Many of his great works are still recognizable at Rome under his name, and are popularly remembered as his; among which are the library buildings of the Vatican. A distinguishing characteristic of his administration, too, was its disinterestedness. He steadfastly refused to use his position for the purpose of advancing any of his relatives, or to bestow upon them property or money derived from the public; and by judicious retrenchment he secured within the first years of his short pontificate a surplus of above 5,000,000 of crowns. It is of course impossible to enter into the details of his foreign policy; it will be enough to say that its great aim was, in the strongest sense of the words, to advance the cause of the Roman Catholic church in every portion of Christendom, against the Huguenots in France, against the Lutherans in Germany, and against queen Elizabeth in England. At the same time, he entertained a deep jealousy and apprehension of the designs of Spain; and he resisted persistently the excessively rigorous measures of the

Spanish inquisition as organized under Philip II. His church administration was equally vigorous and energetic. He fixed the number of the sacred college of cardinals at 70; and it was under him that the present organization of separate congregations of cardinals for the several departments received some of its most important developments. He published a new edition of the Septuagint, and an edition of the Vulgate, which has become famous from the multiplicity of its errors, subsequently corrected in the edition of Clement VIII. Many of the popular stories regarding him are derived from Gregorio Lete's *Vita di Sisto V.* (2 vols., Lausanne, 1669), a work of no authority. See also Tempesti, *Storia della Vita e Gestì de Sisto V.* (2 vols., Rome, 1754); Lorentz, *Sixtus V. und seine Zeit* (Mainz, 1852); Ranke, *Fürste und Völker von Süd-Europa*, and Von Hübner, *Sixtus V.* (1874).

SIZAR (from *sizae*, in university slang, an allowance of victuals from the buttery—or the smallest quantity of anything which can be bought, a word derived from *assize*, formerly the same as *assess*, to apportion), a name given to an order of students at Cambridge and Dublin universities, who are admitted on easier terms than others. Duties of a somewhat menial kind were originally required to be performed by the sizars, but these have long since gone into disuse. Sizars are not on the foundation, and therefore so long as they remain such, are not eligible for fellowships; but they may at any time become pensioners, and generally sit for scholarships immediately before taking their first degree. If successful, they are on the foundation, and may become candidates for fellowships when they have taken their degree.—At Oxford, there is a similar order of students, denominated servitors.

SIZE. See GELATINE.

SKA'GEN, CAPE, or THE SKAW, the most northerly point of Jutland, Denmark. On it is built a light-house of stone, 67 ft. high, the lat. of which is 57° 43' 8" n., long. 10° 36' 5" e.

SKAGER-RACK ("Crooked Strait of Skagen;" *rack* is probably from the same root as A.-S. *raca*, Ger. *rachen*, thus being equivalent to the Celtic *kyle* [in kyles of Bute], Lat. *gula*, English *gully*—is the *race* of Alderney allied to *rack*?), an arm of the North sea (q. v.), lying between Denmark and Norway, and communicating with the Cattegat, is about 150 m. long from w. s. w. to e. n. e., and 80 m. broad. The depth is much greater on the Norwegian than on the Danish coast, being on the former about 200 fathoms, while on the latter it varies from 30 to 40 fathoms, increasing toward the center to about 60. When free from violent storms—to which, however, it is very subject—the current runs e. on the side next Denmark, and w. on that next Norway, the harbors being all on the latter coast.

SKAGIT, co. situated in the n. w. part of Washington. Its principal stream is the Skagit river, navigable for 80 m. from its mouth. Agriculture is the leading industry; 1916 sq. m.; pop. '90, 8747. Co. seat, Mount Vernon.

SKALD (allied to *skill*; the radical sense is to separate, and hence to discern) signifies, in old Norse, a poet. The name was given specially to that class of poets who exercised their art (*skáldskapr*) as a vocation requiring a learned education; that is, a knowledge of the construction of verse, and of the enigmatical imagery, roughly shaped out of obscure tradition, to which Scandinavian poets were prone. The great, if not the only aim of the Skaldic poetry was to celebrate the deeds of living warriors or of their ancestors. For this reason princes attached skalds to their courts, and competed with each other, by magnificent presents, for the possession of the most skillful minstrels. Very few complete Skaldic poems are extant; but, on the other hand, the multitude of fragments preserved, partly in the younger Edda (q. v.), partly in the Sagas (q. v.), and the Heimskringla (see SNORRI STURLESSON), is very great. A manuscript of the younger Edda, belonging to the university of Upsala (which has been printed in the *Historia Literaria Islandica* of Einarsen), contains a list of the most celebrated Icelandic and Norwegian skalds of the 13th c., under the name of *Skáldatal*. The songs relating to the religious and heroic traditions of the north, which are found in the Edda, go back to an earlier time in which the class or school of "skalds," properly so called, did not yet exist. The authorship of these primitive Eddaic songs is unknown; but they are the sources from which the "skalds" of later times drew much of their inspiration.

SKAMA'NIA, a co. in s. w. Washington, having the Columbia river for its s. boundary, separating it from Oregon; 1636 sq. m.; pop. '90, 774, chiefly of American birth, with colored. It is drained by the Cathlapootle, Klikitat, and White Salmon rivers. The surface is mountainous. Co. seat, Stevenson.

SKAT, a German game of cards. It is of quite recent origin, being hardly more than sixty years old.

The derivation of the name is obscure, the Gothic *skatts*, the Anglo-Saxon *skatt*, the modern German *schatz* (treasure), because the two cards which are put aside become a treasure to some one of the players, all make claims. *Scart*, a term used in *Taroc*, a game of Italian origin, also comes as a claimant.

The cards in use are 32 in number, and of pleasing design. Unlike whist cards they are not double-ended. Not only the face cards, but the spot cards as well, show fully

executed figures. Three or more persons enter into the game, although but three are active players, one, the *player* playing against the other two. Each player holds ten cards, two being laid aside *in the skat*. The use of these two cards determines the two different styles of playing. With the skat, it is a simple game, or it may be *Tourné* (an order to turn up one of the cards *in the skat*), the suit of which becomes trumps. Or it may be *without* the skat, in which latter case the varieties of the game are designated as *Solo*, *Nullo*, and *Grando*.

The four suits of the cards are: *Eichlen* (acorn), signifying fruitfulness, or the autumnal season. It is the equivalent of *Clubs* in other cards. The second suit, *Grün* or *Gruen* (green), the equivalent of *Spades*, suggests Spring. *Roth* (red), the equivalent of *Hearts*, implies warmth, or the Summer season. *Schellen* (the bells), is suggestive of sleighing, or the Winter season, and is the equivalent of *Diamonds* in other cards.

These four suits are of graded value in the order named, *Eichlen* being the highest. The trumping power of the Jacks is in the same order, Jack of *Eichlen* always highest, and Jack of *Schellen* lowest. The winning of the game is reckoned principally by points, the point value in each suit being: Jacks, 2; Aces, 11; Tens, 10; Kings, 4; Queens, 3. These, multiplied by four, the number of suits in the pack, make 120, the number of points required. The *Nines*, *Eights*, and *Sevens* do not count. The *Jacks*, though highest trumps, count only two points in scoring. The game is one of points, not tricks, and the number of possible combinations is very great.

The order and valuations of the games is best explained by the following carefully prepared table:

Player taking up the two Skat Cards.....	{	Simple Game, <i>Schellen</i> , or <i>Diamonds</i> , rate.....	1
		“ “ <i>Roth</i> , or <i>Hearts</i> , rate.....	2
		“ “ <i>Grün</i> , or <i>Spades</i> , rate.....	3
		“ “ <i>Eichlen</i> , or <i>Clubs</i> , rate.....	4
		<i>Tourné</i> , <i>Schellen</i> , or <i>Diamonds</i>	5
		“ <i>Roth</i> , or <i>Hearts</i>	6
	{	“ <i>Grün</i> , or <i>Spades</i>	7
		“ <i>Eichlen</i> , or <i>Clubs</i>	8

In the following list, the valuation is increased:

The Skat not being taken up during the game, its points count for player all the same.	{	<i>Solo</i> , <i>Schellen</i> (<i>Diamonds</i>).....	9
		“ <i>Roth</i> (<i>Hearts</i>).....	10
		“ <i>Grün</i> (<i>Spades</i>).....	11
		“ <i>Eichlen</i> (<i>Clubs</i>).....	12
		<i>Grando</i> is rated at.....	16
		but must at least cost.....	48

These rates are the first cost of the game played by the successful bidder, and are reckoned in computing the cost of each particular game. There are, nevertheless, marvelous changes and variations, to be mastered only by practice.

The German Skat-terminology shorn of which the game would lose much of its flavor, is a vehicle of the humorous element in man, and as the game claims humor as its natural companion, or, to express it in another way, one of its integral parts, a few of the more prominent terms and phrases are given, with their literal as well as suggestive renderings:

Daus (deuce), meaning an excellent fellow.

Geben (to deal); *vergeben* (to misdeal).

Mauern (to lay bricks), to block the game; to play dog in the manger.

Ramsch, riff-raff, or scramble; used when no one of the three active hands is strong enough to play against the other two.

Fehlcarten, fail cards, or waste cards. The name *Ladons* is also applied.

Reichs-Skat, Imperial Skat, the outcome of the Altenburg Congress.

Grün König, King of the Green.

Schellen Sieben, the seven ball card.

Matadore, All trump cards so far as they form an unbroken sequence in the player's hand.

Wenzel, Jacks or Knives.

Vorhand, First hand, the party on the player's left to whom the first card is dealt.

Mittelhand, the second or middle player.

Hinterhand, the third player or dealer.

Schneiden, to finesse; also scalp, skin, flay.

Schneider, to cut as bad or ridiculous a figure as a tailor; to be badly beaten as a player.

(The words must not be confounded. One is a noun, the other a verb.)

Schwartz, black. When either party fails to make a trick; as in base-ball, to be whitewashed.

Tourné, Turn-over-game; to turn up one of the two Skat cards, the suit of which becomes trumps.

Postmeistern, To act like a postmaster, who, in the times of stage-coaching, had to assign the passenger's seat. They were generally inclined to hold back the more desirable seats, while making poorer ones do duty first.

Vatermörder, parricide. The *player* losing his game, the opposition banter him by placing some of the cards between their collars and necks, with the points up, signifying that the game has killed its originator.

These, with many others, constitute a series of terms and expressions that have become peculiarly associated with the game of Skat.

At the close of the year 1890, the popularity of the game had caused its recognition in every part of the world where the German influence has a foothold. It is to be found in every part of the globe, wherever three sons of the Fatherland can be found.

A *Bibliography of Skat*, between the years 1876 and 1886, was published by the house of B. Westerman & Co., New York, in which there were over 33 works enumerated regarding the game, in addition to a valuable work published by themselves, in both German and English.

SKATE, the popular name of several species of ray (q.v.)—THE COMMON SKATE (*raia batís*), known in Scotland as the *blue skate* or *gray skate*, and in the south of England as the *tinker*, is plentiful on most parts of the American coasts; the breadth of the body is to its length in the proportion of about four to three; the snout sharp; a slight concavity in the outline between the snout and the extreme lateral angle of the pectoral fin; a short hard tubercle in front of each eye, and another on the inner side of each; a single row of spines commencing on the dorsal ridge near the origin of the ventral fins, and reaching along the tail as far as the first of the two small fins which it bears; the upper parts grayish brown, the belly dusky white with darker lines. It attains a large size, having been known to weigh 200 lbs.—THE LONG-NOSED SKATE (*R. rostrata* or *mucronata*) is remarkable for the elongation and sharpness of the snout. The upper surface is of a light lead color, the lower grayish white. The tail has a row of crooked spines.

SKATES—SKATING. Skates are small keels or blades of iron or steel which are placed under the soles of the feet for the purpose of enabling the wearer to glide along the surface of ice. They are usually fitted to pieces of wood carved into somewhat of a boat-like form, to which straps of leather are adjusted, to enable the skater to attach them firmly to his feet. Of late, in some improved skates, the wood has given way to metallic fittings, which are neater, and perhaps preferable; they are, however, liable to rust, and consequently to get out of order. In America, skating is a favorite pastime in winter; and in England, and Scotland, also, it is carried to a degree of excellence not known in other countries; the skaters study the most graceful curves, and the nicest possible balancing of the body, when going at great speed. In such countries as Holland and the more northern parts of Europe skating is used merely as a necessary means of locomotion among the laboring classes. The name of *roller-skate* has been adopted for a frame for the foot, fitted on small wheels or rollers. On a specially prepared surface, such as an asphalted floor, these roller-skates permit a smooth, gliding motion somewhat analogous to that of skating. Places for this amusement (called *rinking*) have of late years sprung up all over the country, and are known as *skating-rinks*.

SKEAT, Rev. WALTER WILLIAM, b. London, 1835; educated at King's college and Cambridge, graduating in 1858 with high honors; took orders but became lecturer in Christ's college, where he became professor of Anglo-Saxon in 1878. He has devoted much study to Saxon and early English literature, and has edited many texts for the early English text society, for the Oxford press, and completed Kemble's Anglo-Saxon Gospels for the Cambridge syndics. He was one of the founders and a director of the English dialect society. Among his original works are *A Tale of Ludlow Castle*, a *Mæso-Gothic Glossary*, *Etymological Dictionary of the English Language*, and *Principles of English Etymology* (2d series, 1891).

SKELETON (Gr. *skeletos*, dry) is the term applied in anatomy to designate the hard parts or frame-work of animals. In the invertebrate animals the skeleton, except in the case of certain corals, is tegumentary or dermal, forming the outer hard and protective covering, as in the *echinodermata*, *mollusca*, and *crustacea*; and like the epidermis and its appendages, is non-vascular, and can only be increased by additions to its edges. This hard insensible covering serves to protect the animal from hurtful external influences, and to afford fixed points of attachment to the muscles which move the body and limbs; the muscles, however, always lying interior to the skeleton, and not clothing it as we see in the vertebrata. We scarcely ever observe amongst the invertebrata that the skeleton bears any definite relation to the nervous system, which is merely protected by it to the same extent as the other soft tissues. Moreover, in none of these animals are the hard parts composed of true bone.

In the vertebrate animals, although we find occasional cases of bone being deposited in various parts of the body, its most constant position is around the central masses of the nervous and vascular systems, with rays extending thence into the middle of the chief muscular masses, forming the bases of the limbs. "Portions of bone are also developed, to protect and otherwise subserve the organs of the senses, and in some species are found incasing mucus-ducts, and buried in the substance of certain viscera—as, e.g., the heart in the bullock and some other large quadrupeds. Strong membranes, called 'aponeurotic,' and certain leaders or tendons, become bony in some animals—as, e.g., the 'tentorium' in the cat, the temporal fascia in the turtle, the leaders in the leg-muscles in the turkey, the nuchal ligament in the mole, and certain

tendons in the abdominal muscles of the kangaroo, which, so ossified, are called the marsupial bones."—Owen's *Structure of the Skeleton*, p. 163. In some animals (e.g., the sturgeon, the crocodile, the armadillo), bony matter accumulates upon or near to the surface of the body, rendering the skin in some cases absolutely ball-proof.

The following is Owen's theory of the vertebrate skeleton (which, however, is not supported by embryological research—see end of article). The superficial or skin bones constitute the "dermo-skeleton" (Gr. *derma* skin); the deep-seated bones, in relation to the nervous axis and locomotion, form the "neuro-skeleton" (Gr. *neuron*, nerve); the bones connected with the sense-organs and viscera form the "splanchno skeleton" (Gr. *splanchnon*, a viscus or inward part); while those developed in tendons, ligaments, and aponeuroses are termed the "sclero-skeleton" (Gr. *skleros*, hard). In the arrangement of the various parts of the dermo, splanchno, and sclero skeletons no definite plan or law can be detected. The definite end or purpose gained by the position of the bony plates, cases, or rods, belonging to these skeletons is usually easily seen to be connected with the habits and well-being of the animals in which they occur, but the parts cannot be referred to one general type, as in the case of the neuro-skeleton. We will follow Prof. Owen in taking the sturgeon and armadillo as examples of a dermo-skeleton, and shall condense the remarks which he makes on their outer covering. The head of the sturgeon is defended by a case of superficial bony plates, and the body by five longitudinal rows of similar plates, one extending along the mid-line of the back, one along each side of the body, and two along the belly, between the ventral and pectoral fins. These fishes habitually swim low and grovel along the bottom, turning up the mud and sand with their pig-like snout, and feeding on the decomposing organic substances carried down by strong and rapid currents. The heavy dermal osseous plates, regularly arranged in orderly rows along the middle and sides of the body, act as well-arranged ballast. The protection which their plate-armor affords them against the logs and stones hurled along their feeding-grounds, renders needless the ossification of the immediate case of the brain and spinal marrow, and consequently all the parts of the neuro-skeleton remain in the flexible, elastic, gristly state common to all the so-called cartilaginous fishes; the weight of the dermo-skeleton requiring that the neuro-skeleton shall be as light as possible, consistently with the defensive and sustaining functions which it is called to perform. The coat of mail in which the ganoid fishes of an early period were clothed was probably subservient to the same ends as the dermal plates of the sturgeon; and in most of these fishes, as in the sturgeon, the dermal bones are coated externally with a very hard material resembling enamel. In these extinct fishes, the plates are more close-set than in the sturgeon, overlapping each other, and being fastened together like tiles by a peg of one entering a socket in the next, and conversely.

In the armadillo the dermal bones are small, usually five or six sided, smooth internally, and variously sculptured externally—the pattern, however, being constant in, and characteristic of, each species. They are united together at their margins by rough surfaces, and collectively resemble a tessellated pavement. To allow of the requisite movements of the trunk of the armadillo, which have the power of rolling themselves into a ball, a certain number of transverse rows are interposed, having an elastic yielding attachment with one another, and with the anterior and posterior fixed parts of the trunk-armor; and by this arrangement, the head and limbs can be withdrawn beneath the central case, by the action of strong subcutaneous muscles. In the colossal extinct armadillo (the *glyptodon*) the trunk-armor was not divided by bands, but was composed of one immovable piece, covering the back and sides—an arrangement by which the dermo-skeleton would afford increased protection against falling timber, the attacks of other animals, etc.

The splanchno-skeleton is at first sight less apparent than the dermo-skeleton. In most air-breathing vertebrates the larynx, trachea, and bronchial tubes contain a cartilaginous framework which sometimes becomes ossified; in fishes, and in the batrachians in the tadpole state, the gills are supported upon a cartilaginous or osseous framework, developed independently of the vertebral skeleton; and in many mammals the heart contains a bone that serves as a support for its muscular and ligamentous fibers. If to these parts we add the so-called "sense-capsules"—the bony cap which is found in the outer coat of the eye in many birds and most fishes; the hard bony envelope which surrounds the internal ear, and which subsequently, as the petrous portion of the temporal bone, becomes incorporated in most vertebrates with the neuro-skeleton; and the turbinate bones of the nose—and the teeth, we have the principal parts of the splanchno-skeleton. The sclero-skeleton requires no further explanation than that which has been already given; and we therefore proceed to what may be called the skeleton proper—the neuro-skeleton.

From the nature of the subject it is impossible to avoid the introduction of a considerable number of technical terms, which will probably be new, and will sound somewhat harshly to many of our readers; and as few writers can popularize a difficult subject more successfully than Prof. Owen himself (unquestionably the greatest osteologist of the present age), we shall for the most part follow the history of the neuro-skeleton, which he drew up for the benefit of general readers in *The Circle of the Sciences*. A thoughtful examination of the skeleton of any vertebrate shows that it is

arranged in a series of segments, following and articulating with each other in the direction of the axis of the body, from before backward in brutes, from above downward in man. Each complete segment, called a "vertebra," consists of a series of osseous pieces arranged according to the plan shown in Figs. 2 and 3, so as to form a bony hoop or arch above a central piece for the protection of a segment of the nervous axis; and a bony hoop or arch beneath the central piece for the protection of a segment of the vascular system. The upper hoop, N, is called the "neural arch" (Gr. *neuron*, a nerve), and the lower hoop, H, the "hemal arch" (Gr. *hæma*, blood); while their common center, C, is termed the centrum. The neural arch is formed by a pair of bones, *n*, *n*, called "neurapophyses" (Gr. *apophysis*, a projecting part or process), and by a bone, *ns*, sometimes cleft or bifid, called the "neural spine;" it also sometimes includes a pair of bones, *d*, *d*, called "diapophyses" (Gr. *día*, across). The hemal arch is formed by a pair of bones, *pl*, *pl*, called "pleurapophyses" (Gr. *pleuron*, a rib); by a second pair, *h*,

FIG. 1.—TYPICAL VERTEBRA (ideal).

(The signification of the letters is fully given in the text.)

FIG. 2.—ANOTHER MODIFICATION OF A TYPICAL VERTEBRA. C, the centrum, giving off *d*, *d*, the diapophyses, and *p*, *p*, the parapophyses; the neural arch N, inclosing the spinal cord, is formed by *n*, *n*, the neurapophyses, and *ns*, the neural spine; the hemal arch H, inclosing the great centers of the circulation is formed by *h*, *h*, the hemapophyses, and *hs*, the hemal spine. From both the neurapophyses and the hemapophyses may be given off the zygapophyses, *z*, *z*. The lateral arches which may inclose the vertebral arteries *O*, *O*, are completed by the pleurapophyses, *pl*.

called "hemapophyses," and by a bone, *hs*, sometimes bifid, called the "hemal spine." It also sometimes includes parts or bones called "parapophyses" (Gr. *para*, transverse). Bones, moreover, are developed, which diverge as rays from one or more parts of a vertebra. Prof. Owen divides the various parts of a vertebra into (1) the autogenous and (2) the exogenous parts. The autogenous parts are those which are developed from independent centers of ossification (q.v.), and are termed the elements of the vertebra; while the exogenous parts are those that grow from parts previously ossified, and are termed processes. The line between these two sets of parts cannot be strictly drawn, since parts which are usually exogenous are sometimes autogenous, and *vice versa*. The autogenous parts or elements are the centrum, C; the neurapophyses, *n*, *n*; the neural spine, *ns*; the pleurapophyses, *pl*, *pl*; the hemapophyses, *h*, *h*, and the hemal spine, *hs*; while the exogenous parts or processes are the diapophyses, the parapophyses; the zygapophyses (Fig. 2), *z*, *z* (Gr. *zygos*, a junction); the anapophyses (Gr. *ana*, backward); the metapophyses (Gr. *meta*, between); the hypapophysis (Gr. *hypo*, below); and the epapophysis (Fig. 1), *e* (Gr. *epi*, upon). These individual parts may be united with each other in various ways, and may occur in various degrees of development; sometimes they (or some of them) remain entirely disjointed even in the adult animal, while in other cases they are united into a single piece, so that their real distinctness can only be recognized by tracing the history of their development. In most instances some one or more of these parts will be found to be altogether deficient, while in other cases one set of parts is exaggerated to a great degree. Thus, in the third or parietal segment of the human skeleton the neural arch is much expanded, while the hemal one is contracted; while more commonly, as in the thoracic segment or vertebra of a raven, the hemal arch is much expanded and the neural one contracted; while sometimes again, as in the tail of the crocodile and of many other animals, both neural and hemal arches are simultaneously contracted. The segments are commonly simplified and made smaller as they approach the end of the vertebral column or axis, one element or process after another being removed until the vertebra is reduced to its centrum, as in the diagram of the archetype vertebral skeleton. If we glance at the typical vertebra represented

In fig. 2, we observe the diapophyses projecting above a canal that serves for the passage of a blood-vessel, and parapophyses which form the lower boundaries of this canal. These elements never attain any high development in mammals, birds, or reptiles; thus, in the human cervical vertebra, they form the two roots of the transverse process surrounding the foramen for the passage of the vertebral artery, while in the thoracic vertebra of the bird the diapophyses form the transverse processes, and the parapophyses, reduced to mere rudiments, form the articular surfaces with which the heads of the ribs come in contact. In fishes, however, they are much developed, and in the cod tribe are even larger and broader than the pleurapophyses or true ribs. The ordinary function of these lateral processes is to afford attachment to muscles, to protect the lateral vascular trunks (as in the case of the vertebral artery), and to give support to the pleurapophyses, *pl. pl.*, whose development varies extremely in different parts of the same vertebral column, as well as in different animals. Then, in the human cervical vertebra, they form the short bifid transverse processes which are ankylosed at their base to the diapophyses and parapophyses, which surround the vertebral canal. In the thoracic segments they are developed separately, and constitute the ribs which form the greater part of the circumference of the hemal arch. Proceeding to the consideration of the parts below the centrum, we often find the entire hemal arch wanting, as in the cervical and lumbar vertebrae of man and mammals; but in the tail of some mammals and of reptiles a hemal arch, protecting the caudal artery and vein, and closely resembling a neural arch, is found. It is in the thoracic region of mammals, birds, and reptiles that we find the greatest expansion of the hemal arch; the hemapophyses here articulating with the extremities of the ribs instead of with the centrum, and the arch surrounding the entire visceral cavity. In man and mammals the hemapophyses remain unossified, and are known as the cartilages of the ribs; but in birds and reptiles they are ossified, and constitute the sternal ribs. The hemal spine, *hs*, presents great variety of form, and is often altogether absent. In the mammalian thorax it occurs as a flat sternum; in birds the flatness is replaced by a prominent keel on the mesial line, so that a transverse section almost resembles a neural spine; while in reptiles, again, the hemal spine or sternum is flattened laterally, as in mammals. The hemapophyses and hemal spine are absent in the abdominal region of mammals and birds, but are continued backward in the saurians or lizard-like reptiles, whose hemal arch is, notwithstanding, incomplete, from the absence of pleurapophyses. In serpents the hemal arches are wanting through the whole trunk, the ends of the ribs being free; and in fishes generally the hemapophyses and hemal spine are absent or unossified.

Having noticed, as fully as our space permits, the modifications which the typical vertebra undergoes in various animals, and in different parts of the same animal, we now

FIG. 3.—DIAGRAM OF ARCHETYPE VERTEBRATE SKELETON, composed of the following parts:

1. **Basioccipital**; 2, **Exoccipital**; 3, **Supraoccipital**; 4, **Paroccipital**; 5, **Posterior arch of the first or occipital vertebra of the head (the epencephalic arch)**; 6, **Alisphenoid**; 7, **Parietal**; 8, **Mastoid**, constituting the neural arch of the second cervical vertebra (the mesencephalic arch); 9, **Alisphenoid**; 10, **Presphenoid**; 11, **Frontal**; 12, **Post-frontal**, constituting the neural arch of the third or frontal vertebra (the prosencephalic arch); 13, **Vomer**; 14, **Prefrontals**; 15, **Nasal**, constituting the neural arch of the fourth or nasal vertebra (the rhinencephalic arch); 16, **Petrosal** or **acoustic sense-capsule**; 17, **Sclerotic**, or **ophthalmic sense-capsule**; 18, **Utriculo-tubinal**, or **olfactory sense-capsule**; 19, **Palatine**; 20, **Palatine**; 21, **Maxillary**; 22, **Premaxillary**, constituting the maxillary hemal arch; 23, 27, being its diverging appendages; 28, **Tympanic**; 29-32, **Mandibular** or **lower jaw**, constituting the mandibular hemal arch; 33, 37, **Operculars**, being the diverging appendages of this arch; 38, **Stylohyal**; 39, **Ephyal**; 40, **Ceratohyal**; 41, **Basihyal**; 42, **Glossohyal**; 43, **Urohyal**, constituting the hyoidean hemal arch; 44, **Brachioisthegal**, being its diverging appendages; 50, **Supra-scapula**; 51, **Scapula**; 52, **Coracoid**; 53, **Episternum**; 53, **Anterior member**, constituting the scapular hemal arch, with its diverging appendages; 58, **Clavicle**; 62, **Ilium**; 63, **Ischium**; 64, **Pubis**, the hemapophysis of one of the lumbar vertebrae; 65, 69, **Posterior extremity**, constituting the hemal arch of the sacral vertebra skeleton, with its diverging appendages.

come to the more difficult subject of "the archetype vertebrate skeleton," which is made up of a series of vertebræ arranged in a continuous row. The accompanying scheme or diagram represents Prof. Owen's conception of the common pattern or archetype of the vertebrate skeleton. It is difficult at first sight to see any resemblance between this figure and the human skeleton; but, in fact, the human skeleton, of all others, recedes the furthest from the common pattern; and if we turn to fishes, which were the first form of vertebrate life introduced into this planet, we find that they deviate the least from the archetypal idea. If proof be demanded that a given bone in the human skull is an element of a particular vertebra, it is afforded by tracing the same bone through its various modifications in mammals, birds, reptiles, and fishes, till the simple archetypal form is arrived at. The skull is found to be but a continuation of the backbone, and to consist of four vertebræ or segments, corresponding to the four consecutive enlargements of the nervous system, which we call the brain. These segments, reckoning them from behind forward, are termed the occipital, the parietal, the frontal, and the nasal segment. Each segment consists of a neural and a hemal arch.

The neural arches are:

N. I. Epencephalic arch (bones Nos. 1, 2, 3, 4 in figure). N. II. Mesencephalic arch (bones Nos. 5, 6, 7, 8 in figure). N. III. Prosencephalic arch (bones Nos. 9, 10, 11, 12 in figure). N. IV. Rhinencephalic arch (bones Nos. 13, 14, 15 in figure).

The hemal arches are:

H. I. Scapular arch (Nos. 50-52). H. II. Hyoidean arch (Nos. 38-43). H. III. Mandibular arch (Nos. 28-32). H. IV. Maxillary arch (Nos. 20-22).

The jaws are the modified hemal arches of the first two segments; and the mouth opens at the interspace between these arches. The position of the vent varies (in fishes), but always opens behind the pelvic arch, S 62, 63, *p*, where this is ossified. Outlines of the chief ossified developments of the dermo-skeleton, in different vertebrates, are added by Prof. Owen to the neuro-skeletal archetype; as, for example, the median horn, supported by the nasal spine, 15, in the rhinoceros; the pair of lateral horns developed from the frontal spine, 11, in most ruminants; the median folds, DI, DII, above the neural spines, one or more in number, constituting the dorsal fin or fins in fishes and cetaceans, and the dorsal hump or humps in the buffaloes and camels; similar folds are sometimes developed at the end of the tail, constituting the caudal fin, C, and the anal fin or fins, A, of fishes.

It has been already remarked that bones which diverge as rays are formed from one or more parts of a vertebra. These "diverging appendages" are mainly connected with the hemal arches, and those which especially concern us are the pectoral appendages of the scapular arch, which become developed into fore-limbs or arms, and the pelvic appendages which are attached to their supporting hemal arch, 63, *hs*. If we examine the skull of a cod-fish, in which the bones have been arranged according to the segments or vertebræ to which they belong, we observe that the occipital vertebra has a widely expanded hemal arch, consisting of three pairs of bones with diverging appendages. The special names given by Owen to the various elements of that hemal arch, from above downward, are "suprascapular," No. 50; "scapula," No. 51; "coracoid," No. 52. The scapular arch thus formed supports and protects the heart or center of the hemal system, and in most fishes supports the pectoral fin, while in other animals the appendage that here becomes a fin is modified into a fore-leg, a wing, an arm, and a hand. Some of the special names originally employed in human anatomy are retained and applied to like parts in the pectoral fin of the fish; but it will be observed that Prof. Owen designates each bone not only by a name but by a numeral. Of the two flat bones connecting the fin with the coracoid, the upper one is the "ulna," No. 54; the lower, the "radius," No. 55, the row of short bones joined with these are the "carpals," No. 56; beyond which are the metacarpals and phalanges. Ascending from fishes to reptiles, we find that, in the lower batrachia (as the *amphiuma*), the scapulæ are detached from the occiput, and that other important modifications have occurred. The coracoids are well expanded, three segments of the diverging appendage are ossified, and two of these segments are bifid, showing a simple beginning of the radiating multiplication of parts. The first segment is the seat of these modifications, which have acquired for it the special name of "humerus;" the two divisions of the next segment of the appendage are called "ulnar" and "radius;" the gristly mass is the carpus, and the two bony divisions are the digits or fingers. We have here got so distinct a rudimentary arm, separated from the head, although, according to the views propounded in this article, an appendage of the occipital segment of the cranium, that it is unnecessary to trace the further modifications that ensue, which lead finally to the arm and hand of man. It is only necessary to remark that in mammals, except amongst the non-placental orders, the coracoid bone is reduced to a mere rudiment, being known as a process of the scapula, and that its function—namely, that of keeping the shoulders apart—is performed by the clavicle, which, according to Owen, is the hemapophysis (58) of the first cervical vertebra (see fig. 3). With regard to the pelvic arch, we have only space to add that it must be regarded as the hemal arch of one or more of the pelvic vertebræ; and there is undoubted evidence to show that the pelvic and scapular arches are constructed on the same plan; the "ileum" answering to the scapula.

The elaborate and ingenious morphological theory of the skeleton here outlined was founded entirely upon the comparison of adult structures, and has of late years been entirely disproved, in principle and detail, by actual observation of the phenomena of development. For some account of the embryological theory of the skeleton, which is now securely founded, chiefly through the labors of Huxley, Parker, and Gegenbaur, see the article **SKULL**, or Huxley's *Anat. of Verteb. Animals*; Balfour's *Embryology*, or Parker's *Morphology*. The chemical composition, structure of bone and cartilage, and their relations, will be found in the articles **BONE**, **CARTILAGE**, **OSSIFICATION**, and **SKELETON**. The human skeleton is composed of 200 distinct bones, exclusive of the 32 teeth and the three ossicles in each tympanum. See **EAR**. It is conveniently, and not unnaturally, divided into four regions: 1. the skull, composed of 22 bones; 2. the trunk, composed of 54 bones; 3. the upper extremities, composed of 64 bones; and 4. the lower extremities, composed of 60 bones. In some respects it is more natural to count 62 bones in the lower extremities, including the hip bones, as they are connected with the hip joint in much the same manner as the clavicle and shoulder-blade are with the shoulder joint. These hip bones, however, form a part of a very distinct and functionally important part of the skeleton, viz., the pelvis, and for this reason it is well to keep this division of pelvis distinct. See **PELVIS**. The skull is described under that title. The trunk may be divided into ribs, 24; vertebrae, 24; and pelvis, 4, the two lower bones of the spinal column, viz., the sacrum and coccyx, being included in the pelvis. If we include the vertebrae and sacrum and coccyx in one division, the spinal column, and the two hip bones with the lower extremities, we shall, in this view, eliminate the pelvic division. A consideration of the fact that the spinal nerves enter the sacrum and pass through orifices having the same anatomical relations as the orifices in the vertebrae, would point to the propriety of placing the vertebrae and the sacrum and coccyx together, but the physiological connection of these latter bones with the pelvis present sufficient reasons for the division here made. The trunk has also 1 sternum, or breast bone, and 1 hyoid, or tongue bone (see **HYOID BONE** and **TONGUE**), making in all 54 bones. The ribs are described under that title. They are shown in the cut, 12 on each side; 7 true and 5 false or floating ribs. The true ribs are joined to the sternum, which is seen to consist of 3 pieces, viz., the manubrium, the gladiolus, and the ensiform cartilage. The manubrium is the heart-shaped piece to which the internal ends of the clavicles or collar-bones are joined, their external ends being articulated with the shoulder-blade, or scapula, at the shoulder joint, as seen in the cut. See **CLAVICLE** and **SCAPULA**. The gladiolus is the middle piece of the sternum, with which the 7 true ribs articulate. The ensiform cartilage is the small spatula-shaped piece seen pointing downward into the triangular space between the cartilages of the 5 floating or false ribs. The vertebrae are described in the article **SPINAL COLUMN**. The pelvis (basin) is seen in the middle of the figure supporting the vertebral column, and forming with the thigh bones the hip joints. The upper extremity is divided into bones of the shoulder, 2, clavicle and scapula; of the arm, 1, the humerus (q.v.); of the fore-arm, 2, the radius and the ulna; of the wrist or carpus, 8; of the metacarpus, 5; and of the phalanges or finger bones, 14 = 32 bones in each upper extremity, or 64 in both. For a description of the bones of the upper extremity see **HAND**. Passing to the lower extremities, we observe the femur (q.v.). Its condyles are seen to be partly covered in front by the knee-pan or patella (q.v.). Below this are seen the bones of the leg. The strong bone on the inner side of each leg is the tibia. Its upper expanded extremity or head forms with the condyles of the femur the knee joint, and its lower expanded extremity forms with the astragalus, one of the instep bones, the greater part of the ankle joint. See **LEG** and **FOOT**. There are 7 bones in each instep, or tarsus, 5 in the metatarsus, and 14 in the toes, or phalanges, making in all 26 bones in each foot. These, with the leg, patella, and femur, comprise 30 bones for each lower extremity, or 60 for both.

SKELLIGS, THE, three rocky islands on the west coast of Ireland, about 8 m. west of Bolus Head, co. Kerry, in long. $10^{\circ}33'$ west. The lights on the Great Skellig are the first visible to ships crossing the Atlantic.

SKELTON, JOHN, an early English satirical poet, is supposed to have been born about the year 1460, but whether in Norfolk or Cumberland is uncertain. He studied at both Cambridge and Oxford, and received from each the academical honor of laureate. His sovereign, Henry VII., appointed him tutor to the young prince Henry, afterward king Henry VIII.; and Erasmus, in allusion to his learning, styled him the light and grace of British scholars. At this time Skelton had produced some translations, written elegies on Edward IV. (1483) and the duke of Northumberland (1489), and was author of some stiff court masques and allegorical poems of little or no merit. He entered the church in 1493, and became rector of Diss in Norfolk, shortly after which he seems to have struck into that vein of original vernacular poetry, addressed to the multitude, for which he is unique among our elder bards, and which helped to fix our language. It consists in a flow of rattling voluble verse, unrestrained satire and jocularity, and a profusion of grotesque imagery mixed up with Latin and slang phrases. At times Skelton has gleams of bright fancy and snatches of pleasant description. Of this higher class is his *Philip Sparrow*, being a poetical lamentation made by a young maiden (whose charms the poet describes with great gusto and minuteness) over the loss of a pet

bird slain in a convent of black nuns at Carowe near Norwich. The most humorous of his pictures of low life—often coarse enough—are found in the piece entitled *The Tun-ting* [or brewing] of *Elynor Rummyng*, an ale-wife at Leatherhead in Surrey. This poem was highly popular, and was often reprinted in black-letter, garnished with a rude wood-cut representation of the fat hostess. His best satires are *Colin Clout*, and *Why Come Ye not to Court?* The former is a general satire on the clergy; and the latter, a virulent attack on cardinal Wolsey, whom the unscrupulous poet had previously flattered, but who had disappointed him of a prebend which he coveted. In this scurrilous lampoon, Wolsey is not only charged with arrogance, avariciousness, and incontinence, but is reminded of his "base original" and "greasy genealogy," having been "cast out of a butcher's stall." The enraged cardinal ordered his libeler to be arrested, but Skelton took refuge in the sanctuary at Westminster, and received the protection of abbot Islip. From this retreat he did not dare to emerge, but continued silent under its sacred shelter till his death in 1529. The "pithy, pleasaunt, and profitable workes of maister Skelton, Poete Laureate" were collected and published in 1568, and reprinted in 1736. An edition, carefully edited by the Rev. A. Dyce, was issued in 1843, in 2 vols. 8vo.

SKEPTICISM (Gr. *skeptomai*, "I consider") strictly denotes that condition in which the mind is before it has arrived at conclusive opinions—when it is still in the act of reflecting, examining, or pondering over subjects of thought. Skepticism is therefore the opposite of dogmatism (see **DOGMA**). The notion of "disbelief" is quite a secondary meaning of the term. Among the Greeks a *skeptikos*, "skeptical," was originally only a thoughtful person, and the verb *skeptomai*, never acquired any other signification than "to consider." But inasmuch as the mass of men rush to conclusions with haste, and assert them with far more positiveness than their knowledge warrants, the discerning few of clearer vision or cooler head are often brought into collision with popular beliefs—more especially in religion, the sphere in which popular beliefs are most numerous, most positive, and most inconsiderate—and are compelled by the violent shock given to their reason to "doubt," it may be to "disbelieve," what they hear affirmed by the multitude with indefensible emphasis of speech. Thus it is that in common parlance a skeptic has come to mean an infidel, and skepticism infidelity. But the field of thought in which skepticism properly so-called has preferred to exercise itself is not religion but philosophy. Philosophical skeptics in all ages and countries have generally denied or at least doubted the trustworthiness of the senses as vehicles of absolute truth, and so have destroyed the very possibility of speculation. In ancient times Pyrrhon (q.v.), in modern, David Hume (q.v.), are the most characteristic representatives of this kind of skepticism.

SKERRIES, THE (skerry is a term for any isolated sea-girt rock), small islands about 2 miles off the n.w. coast of Anglesey, having a light-house 117 ft. high. See also **PENTLAND FIRTH**.

SKER RYVORE is the chief rock of a reef which lies about 10 m. s.s.w. of the s.w. point of the island of Tiree (q.v.), and 24 m. w. of Iona. This reef, which stretches from 8 to 10 m. in a w.s.w. direction, is composed to compact gneiss, worn smooth by the constant action of the waves, and was long a terror to mariners, having caused the loss of one ship annually for forty years previous to 1844. The northern light-house commission had long intended the erection of a light-house on Skerryvore, the only point of this dangerous reef which could afford the needful foundation; but the difficulty of landing on the rock, from the immense force (three tons to the superficial foot) with which the Atlantic waves beat upon it, caused the delay of the scheme till 1834, when preparations were made in earnest. The design and superintendence of the construction of the building were intrusted to Mr. Alan Stevenson, who commenced operations on the rock in 1838, following generally the mode adopted by his father, Mr. Robert Stevenson (q.v.), in the construction of the Bell rock (q.v.) light-house; and, in spite of occasional disasters from tempests, completed his work in 1844. The light-house is 138½ ft. high; at the base 42 ft., and at the top 16 ft. in diameter. The light, a revolving one, is produced by the revolution of eight large annular lenses round a lamp of four wicks, according to Fresnel's first dioptric system, and can be seen at a distance of 18 miles. The cost of erection was close upon \$435,000. Skerryvore light-house is nearly ½ higher than that on the Bell rock, and more than twice as high as the Eddystone.

SKETCHLEY, ARTHUR (the assumed name of GEORGE ROSE), 1830-82; b. Eng.: began as a clerk in the custom house; subsequently entered as a commoner at Oxford, where he obtained the usual degrees. He took orders in the Anglican church, but resigned on his conversion to Roman Catholicism, 1845, and was for five years tutor to the Duke of Norfolk. He was the author of a number of light comedies, and of a series of popular papers in which "Mrs. Brown," the type of the meddling, gossiping, and fussy Englishwoman of the middle classes, was made to deliver her opinions on various topics of the day.

SKEW-BRIDGE, a bridge placed obliquely so as to cross a road or river at an angle not a right angle. Such bridges, built of stone, are not easy of construction, owing to the peculiar twisted forms which the voussoirs assume, and were scarcely ever used till the necessities of railway curves compelled their introduction. They are evidently a

great improvement on the old-fashioned mode of twisting a road, first to the right, and then to the left, in order to get the bridge at right angles to the place to be crossed. Since the introduction of iron girders as the supports of bridges, skew-bridges have become easy of construction, and are now quite generally used.

SKIBBEREEN, a market-t. of the county of Cork, Ireland, and situated in lat. $51^{\circ} 34'$ n., long. $9^{\circ} 16'$ w., distant from Cork 42 m. s.w. It is a place of little commerce, and almost entirely without manufactures. The pop. in 1891 was 3269.

SKID, in military and naval language, is any timber which is used as a base to keep one object from resting on another. Thus, a row of cannon in store will be kept from the ground by skids.

The term is also applied to the drag which is put on the wheels of carriages in going up hills, to prevent rolling backward.

SKID DAW, a mountain in Cumberland, near the center of the county; height, 3,054 feet. A few miles to the s. lie Derwent Water and the town of Keswick.

SKIMMER, a name applied to several species of the genus *rhynchops* of the gull family (*laridae*, q.v.). The genus has the following characteristics: Bill longer than the head, nearly or quite straight, compressed laterally to the end. Lower mandible nearly one inch longer than the upper, and square at the point. Upper mandible grooved for the reception of the lower. The mechanism is remarkable, being adapted to cut like scissors, and the bird is sometimes called *scissor-bill*. The wings are very long and narrow, with the first quill the longest; tail moderate and forked; feet moderately long and slender, with an indented web; hind toe elevated, and claws curved and sharp. *R. nigra* is the *becan-ciseaux*, and *coupeur d'ear* of the French; shear-water, cut-water, skimmer, and black skimmer of the United States, and the *piscator* of the Chilians. The male is about 19 in. long; closed wings extend 4 in. beyond the tail; alar expansion, 44 inches. Length of the lower mandible four and a half inches; upper, three and a half; both mandibles red, tinged with orange and tipped with black. Upper part of the head, neck and back, and scapulars black; wings the same except the secondaries, which are white on the inner vanes, and also tipped with white. The forked tail having black feathers, broadly edged on either side with white; tail coverts white on the outer sides; black in the middle, front, cheeks, neck below the eye, throat, breast, and all the lower parts white. Legs and webbed feet red. The female is 16 in. long, with 39 in. wing expansion; plumage similar to that of the male, except the tail, which is white shafted and broadly centered with black. Mr. Nuttall says that it is a bird of passage in the United States, appearing in New Jersey, its most northern limit as he thinks, from its tropical quarters in early May; and he believes it passes the breeding season along the whole of the southern coast of the United States. Their nests have been found along the shores of cape May about the beginning of June. They are made by scratching a hollow in the sand. There are usually three eggs, which are nearly two inches long by one in diameter; white with brown blotches, some of them large.

SKIMMERTON. See CHARIVARI.

SKIN. Considered in its general physiological and histological (or textural) relations, the skin is merely a part of the great mucous system to which the mucous membrane and secreting glands also belong, and which consists of two essential elements—a *basement tissue*, composed of simple cutaneous membrane, and an *epithelium* of nucleated particles resting on it—while beneath the basement membrane are vessels, nerves, and connective tissue. See EPITHELIUM and MUCOUS MEMBRANES. In the skin, the hard and thick epithelium is termed *cuticle* or *epidermis*, and the true skin below it is termed the *derma* or *cutis vera*, and is chiefly formed of modified and very dense connective (or areolar or cellular) tissue.

The external surface of the skin formed by the cuticle is marked by furrows of different kinds. Some (termed furrows of motion) occur transversely in the neighborhood of joints, on the side of flexion; others correspond to the insertion of cutaneous muscles; while others, of quite another kind, are seen in aged and emaciated persons, and after the subsidence of any great distention of the integument; and besides these coarse lines, most parts of the skin are grooved with very minute furrows, which assume various courses in relation to one another. These minute furrows are most distinctly seen on the palmar aspect of the hand and fingers, and on the sole of the foot. The outer surface of the skin also presents innumerable pores for the discharge of the contents of the sudoriparous and sebaceous follicles, or the sweat and fat glands; and the modifications of epidermis known as hair and nails occur on the same surface.

The deep layer of the skin consists of connective tissue, in which both the white and yellow fibrous elements are considerably modified as to the proportions in which they occur, and smooth muscles are present in no inconsiderable quantity in some parts of the skin. Where great extensibility, with elasticity, is required, the yellow (elastic) element predominates; and where strength and resistance are specially required, as in the sole of the foot, the *cutis* is chiefly composed of a dense interweaving of the white (inelastic) element. The thickness and strength of this layer differ greatly in different parts, according to the amount of resistance required against pressure. The skin is

thicker on the hinder surface of the body than in front, and on the outer than on the inner sides of the limbs. "It is unusually thin over the flexures of the joints. It is particularly delicate in the eyelids, and proportionably so in some other situations where great mobility is demanded. In regions which are most subject to external pressure, as the soles of the feet, it is firmly united by very dense laminae to the sub-cutaneous fascia; and the intervals between these are provided with pellets of fat, forming a cushion, as an additional means of protection to the delicate organs it incloses and covers. Among the lower animals we may notice numberless examples of an analogous kind."—Todd and Bowman's *Physiological Anatomy and Physiology of Man*, vol. i. p. 407. The blubber of the whale merely represents, in a very exaggerated form, the layer of fat which generally occurs in the sub-cutaneous areolar tissue of man and most animals, serving as a soft bed on which the skin may rest, and gives the appearance of plumpness and symmetry to the outline of the body. It is on the external surface of the cutis that the *tactile papillae*, or true organs of touch, are developed. Kölliker divides the true cutis into the "reticular" and "papillary" portions, the latter being the reddish-gray external superficial layer which contains the upper portion of the hair follicles and cutaneous glands, and whose most important element is these tactile papillae. They are most abundant and largest in the palm of the hand* and the sole of the foot, while in the back and in the outer sides of the limbs they are almost entirely absent. They occur as small, semi-transparent, flexible elevations, which are usually conical or club-shaped in form; but in certain parts, as the palm of the hand, present numerous points (in which case they are termed compound papillae).

The thickness of the true skin varies, according to Kölliker, from $\frac{1}{8}$ of a line to a line and a half. In its chemical characters it agrees with those of the connective tissue, of which it is principally composed. The gelatine which it yields on boiling is derived mainly from the white fibrous tissue, and it is probably this element which is principally concerned in the changes which skin undergoes in the process of tanning. Arteries from the sub-cutaneous connective tissue freely enter into the structure of the skin, and are distributed to the fat-lobules, the sudoriparous and sebaceous glands (presently to be described), hair follicles, papillae, etc. In these several parts they terminate in a close network of capillaries. Those parts of the skin which border upon the epidermis are for the most part very freely provided with nerves, while in the deeper parts the nervous filaments are comparatively scanty. How they terminate is still a subject of dispute; but the view most generally adopted is that they end in loops.

The glands occurring in the skin next claim our consideration. They are the *sudoriparous* or sweat glands, the *sebaceous* or fat glands, and the *ceruminous* glands. The sweat glands exist in almost every part of the human skin. They lie in small pits in the deepest parts of the true skin, and sometimes entirely below the skin. Their orifices can be seen in the middle of the cross grooves that intersect the ridges of the papillae on the hands and feet, their arrangement being here necessarily regular, while in other parts they are irregularly scattered. Their size and number in different regions of the skin correspond with the amount of perspiration yielded by each part; thus they are nowhere so much developed as in the axilla or armpit. In that part of this region, which in the adult is more or less covered with hair, they form a layer of a reddish color, of about an eighth of an inch thick. They are soft, and more or less flattened by their pressure on one another, being imbedded in delicate connective tissue, and covered and permeated with a net-work of capillaries. On isolating one of these glands, and highly magnifying it, it is found to consist of a solitary tube, intricately raveled, one end of which is closed, and hidden within the glandular mass, while the other emerges from the gland. The wall of the tube consists of an outer or *basement membrane*, with which the blood-vessels are in contact, and an *epithelium*, lining the interior, the former disappearing when the tube reaches the surface of the papillae. The duct, on leaving the gland, follows a meandering and rather spiral direction through the reticular portion of the cutis to the interval between the papillae, when it becomes straight; and it again assumes a spiral course in perforating the cuticle. It is not easy to explain how or why so beautifully regular a spiral form should be given to the cuticular portion of the duct, which is rather wider than the rest, the average diameter of the duct being $\frac{1}{1700}$ of an inch.

The *sebaceous glands* are small whitish glands, which exist in almost every part of the skin, except the palms and soles, and are especially abundant in the scalp, face (the nose being particularly rich in them), and about the anus. They are usually connected with the hairs, and consist of a duct terminating in a blind pouch-like or pear-shaped extremity. The *basement membrane* of these glands is lined by an epithelium, in the particles of which are included granules of fatty or sebaceous matter, which, having become detached, constitutes the secretion. These glands are the seat of the parasite known as *acarus folliculorum*.

The *ceruminous glands* are brown simple glands, in external appearance like the sudoriparous glands, occurring in the cartilaginous portion of the external meatus of the ear. They yield an adhesive bitter secretion, which protects the membrane of the tympanum from the access of dust, insects, etc.

* In one square line of the palm of the hand, E. H. Weber reckons that there are 81 compound, and from 150 to 200 smaller papillae, arranged in tolerably regular rows.

We shall conclude by taking a brief survey of the functions of the skin, omitting, however, its most important function, touch (q. v.). Regarded as a protective covering, the skin possesses the combined advantages of toughness, resistance, flexibility, and elasticity; the connective framework being the part which mainly confers these properties, although the epidermis co-operates with it. The subcutaneous layer of fat, and the modifications of epidermis in various forms, as hairs, wool, feathers, scales, etc., serve for the preservation of warmth, and occasionally (when they occur as claws, talons, etc.) as means of offense or defense. The skin is the seat of a twofold excretion, viz., of that formed by the sudoriparous glands, and that formed by the sebaceous glands. The fluid secreted by the sudoriparous glands is usually formed so gradually that the watery portions of it escape by evaporation as soon as it reaches the surface; but in certain conditions, as during strong exercise, or when the external heat is excessive, or in certain diseases, or when the evaporation is prevented by the application of a texture impermeable to air, as for example oiled silk, or the material known as mackintosh, or india-rubber cloth, the secretion, instead of evaporating, collects on the skin in the form of drops of fluid. When it is stated that the sweat contains urea, lactates, extractive matters, etc., and that the amount of watery vapor exhaled from the skin is, on an average, 2½ lbs. daily (according to Valentin's observation), the importance of the sudoriparous glands as organs of excretion will be at once manifest. Moreover, there is reason to believe, from the experiments of Scharling, Gerlach, and others, that the importance of the skin as a *respiratory* organ is far from inconsiderable, very appreciable quantities of carbonic acid being exhaled hourly by the external surface of the body. In the amphibia, in which the skin is thin and moist, the cutaneous respiration is extremely active; and that the respiratory function of the skin in the higher animals is also considerable, is proved not only by measuring the excreted carbonic acid, but by the fact that if the skin is covered with an impermeable varnish, or if the body be inclosed, all but the head, in a caoutchouc dress, animals soon die, as if asphyxiated, their heart and lungs being gorged with blood, and their temperature before death gradually falling many degrees. The secretion of the sebaceous glands is a semi-fluid oily mass, which often solidifies into a white viscid tallow-like matter on the surface or in the glandular ducts, from which it can be removed by pressure, in a form resembling that of a small whitish worm or maggot. Under the microscope, cells containing fat, free fat mixed with epidermic scales, and sometimes crystals of cholesterol, are observed. Its chemical constituents, in addition to water, are a peculiar nitrogenous matter resembling casein, fat (consisting of palmitin and olein, soaps composed of palmitic and oleic acids), cholesterol, earthy phosphates, and chlorides and phosphates of the alkalies. Its purpose seems to be that of keeping the skin moist and supple, and by its oily nature, of hindering too rapid evaporation.

The skin is, moreover, an organ of absorption: mercurial preparations, when rubbed into the skin, have the same action as when given internally. Potassio-tartrate of antimony, when rubbed into the skin in the form of ointment or solution, may excite vomiting, or an eruption extending over the whole body, and many other illustrations might be given. The effect of rubbing is probably to force the particles of the matter into the orifices of the glands, where they are more easily absorbed than they would be through the epidermis. It has been proved by the experiments of Madden, Berthold, and others, that the skin has the power of absorbing water, although to a less extent than occurs in thin-skinned animals, such as frogs and lizards. This fact has a practical application. In severe cases of dysphagia—difficult swallowing—when not even fluids can be taken into the stomach, immersion in a bath of warm water, or of milk and water, may assuage the thirst. Sailors, also, when destitute of fresh water, find their urgent thirst allayed by soaking their clothes in salt water.

The *diseases* of the skin, and their classification into genera and species, have occupied the attention of many of the most eminent physicians during the last century; but none of the proposed classifications are very satisfactory. See ECZEMA; ECTHYMA.

SKIN GRAFTING. In cases of extensive destruction of the skin, leaving large sores that do not heal, and also in treating old ulcers; small particles of skin, cut from the patient or another person, are placed upon the sore. Here they soon become attached and grow, forming a number of small islands or patches of skin over the surface of the ulcer; these in time spread till the whole raw surface is covered. By this grafting process, some sores that would never heal can be rapidly cured. The patches of skin used are about the size of a large pin's head, and placed on with the raw surface next to the sore. Skin from a colored person has been transplanted to a white person, and is found to produce a white skin. See RHINOPLASTIC OPERATION.

SKINK, or SCINK, *Scincus officinalis*, a saurian reptile, found in the north of Africa, and in some parts of Asia. It is from 6 to 8 in. long, generally of a reddish-dun color, with darker transverse bands, a wedge-shaped head, and four pretty strong limbs. It has been in great repute for imaginary medicinal virtues from remote times; it was largely imported on this account into ancient Rome, and is still in high esteem in the east, dried skinks finding a ready sale in many places, as Cairo and Alexandria. There is almost no disease for which it has not been supposed to be a cure. See *illus.*, **REPTILES**, ETC., vol. XII.

SKIN-MOTH, a name given to certain coleoptera which attack skins and furs, and prepared animals in zoological collections. The most common are *dermestes vulpinus*, *dermestes lardarius*, and *anthrenus museorum*. The two first mentioned of these insects are less than a quarter of an inch long, and are very destructive, both in the larval and imago condition. The *anthrenus* is only about one-tenth of an inch long. The best antidote for them all is benzine.

SKINNER, THOMAS HARVEY, D.D., LL.D., 1791-1871; b. N. C.; graduated at Princeton college in 1809; studied law for 18 months; was licensed to preach in 1812; was colleague of Dr. Janeway, Philadelphia, 1813-16; pastor of the Fifth Presbyterian church, Philadelphia, 1816-32; professor of sacred rhetoric at Andover theological seminary, 1832-35; pastor of Mercer st. church, 1835-48; professor of sacred rhetoric and pastoral theology in Union theological seminary, New York, from 1848 to his death. He published *Religion of the Bible*; *Aids to Preaching and Hearing*; *Hints to Christians*; *Religious Life of Francis Markoe*; *Vinet's Pastoral Theology and Homiletics* (translated); *Discussions in Theology*.

SKIRMISHERS are soldiers operating in loose array, two together—i.e., front and rear, with a lateral distance of about six paces between the files. When the army advances, the ground in front, and for some distance on each flank, is usually covered by skirmishers, to prevent surprise. If cavalry come suddenly on them, they rush together, and form small squares, called rallying squares. Skirmishers fire independently at their own discretion; but the rule is, that one of the two men composing a file should always have his rifle loaded. Orders are communicated by the sound of bugle.

SKIRRET, *Sium sisarum*, a perennial plant of the natural order *umbellifera*, a native of China and Japan, but which has long been cultivated in gardens in Europe for the sake of its roots, which are tuberous and clustered, sometimes 6 in. long, and of the thickness of the finger. They are sweet, succulent, and nutritious, with a somewhat aromatic flavor, and when boiled, are a very agreeable article of food. A kind of spirituous liquor is sometimes made from them. Good sugar can also be extracted. Skirret was at one time more cultivated in Britain than it is at present, although there seems to be no good reason for its having fallen into disrepute. It is propagated either by seed or by very small offsets from the roots. It has a stem of 2 to 3 ft. high; the lower leaves pinnate, with oblong-serrated leaflets, and a heart-shaped terminal leaf, the upper ones ternate with lanceolate leaflets.

SKOBELEFF, MIKHAIL DIMITRIEVITCH, 1841-82; b. in the dist. of Raizan near Moscow; d. Moscow. He attended the military acad. of St. Petersburg, but was dismissed, 1861, and was sent with a regiment into Poland. His career began, 1873, in Turkestan, where he was prominent in the Khiva expedition. He was made colonel, and soon afterwards went to Spain, where he fought in the Carlist war. He returned to Turkestan and greatly distinguished himself, rising to the rank of general, 1875. In the second war with Khokan he commanded the expedition, and compelled the Khan to surrender. When Khokan was annexed to Russia, 1876, he was made governor. In the war with Turkey he commanded one of the Russian divisions, and won world-wide fame before Plevna. His last service was the capture of Goek Tepe, a stronghold in Turkestan.

SKOPIN', a t. of Russia, government of Riazan, and 160 m. s.e. of Moscow, is situated on the Verda, a tributary of the Oka, which is itself a tributary of the Volga. It has a trade in grain, hemp, oil, meat, salt, corn, and cattle. Pop. '93, 13,654.

SKOWHEGAN, town and co. seat of Somerset co., Me.; on the Kennebec river, and the Maine Central railroad; 37 miles n. of Augusta. It contains a high school, public library, Memorial hall, co. law library, electric-light plant, electric railroad connecting with Norridgewock, waterworks, and national and savings banks. The river here falls about 30 feet, affording excellent power for manufacturing, the principal articles being woolen goods, pulp, lumber, shoes, carriages, grist, coffins and caskets, oil-cloth, woodwork, and planing and molding mill products. Pop. '90, 5068.

SKU'A, or SKUA GULL, *Lestris*, a genus of birds of the family *larinæ*, also known by the name JÄGER (Ger. hunter), and differing from the gulls in having the upper mandible more hooked at the tip, and the nostrils larger and further forward in the bill, the base of which is covered with a cere. The skuas are bold and powerful birds, and generally obtain their food by pursuing gulls or terns, and causing them to disgorge the fish which they have captured, which they dart upon and seize in the air. They also eat eggs and small birds. The COMMON SKUA (*L. cataractes*) is fully 2 ft. in length, of a brown color, with lighter streaks on the head and neck. It inhabits the northern seas, and breeds in some of the Shetland isles.

SKULL. The skull is divided into two parts, the cranium and the face. In human anatomy, it is customary to describe the former as consisting of 8 and the latter of 14 bones; the 8 cranial bones, which constitute the brain-case, being the *occipital*, *two parietal*, *frontal*, *two temporal*, *sphenoid*, and *ethmoid*; while the 14 facial bones are the *two nasal*, *two superior maxillary*, *two lachrymal*, *two malar*, *two palate*, *two inferior turbinated*, *omer*, and *inferior maxillary*. The bones of the ear, the teeth, and the Wormian bones are not included in this enumeration. The morphologist, however, who wishes to trace

out the fundamental similarity of type in the structure of the various modifications of the vertebrate skull, will not be content with this arrangement, in which, as, for example, in the occipital, temporal, and sphenoid bones, the human anatomist considers as a single bone an osseous mass consisting primarily in man, and persistently in some of the lower vertebrates, of several distinct pieces or elements. Postponing to the close of this article any remarks on the structure of the vertebrate skull generally, we shall proceed to notice the ordinary anatomical relations of the human skull. The development of the skull is a subject of great interest, not only in itself, but as throwing light on many points which the study of the adult skull would fail to explain. At a very early period of fetal existence, the cerebrum is inclosed in a membranous capsule external to the dura mater, and in close contact with it. This is the first rudiment of the skull, the cerebral portion of which is consequently formed before there is any indication of a facial part. Soon, however, four or five processes jut from it on either side of the mesial line, which grow downward, incline toward each other, and unite to form a series of inverted arches, from which the face is ultimately developed. Imperfect development or ossification of these rudimentary parts of the face gives rise to the peculiarities known as "hare-lip" and "cleft-palate," or in very extreme cases to the form of monstrosity termed "Cyclopean," in which, from absence of the frontal processes, the two orbits form a single cavity, and the eyes are more or less blended in the mesial line.

The following is a brief summary of the succession of events that occur in the ordinary or normal development of the skull. Cartilage is formed at the base of the mem-

Fig. 1.—Side view of Human Skull.

1, Frontal bone; 2, Parietal bone; 3, Occipital bone; 4, Temporal bone (squamous portion); 4*, Do. (mastoid portion); 5, Sphenoid bone; 6, Malar bone; 7, Nasal bone; 8, Superior maxillary or jaw bone; 9, Inferior maxillary or jaw bone.

Fig. 2.

1. Anterior fontanelle; 2, Posterior fontanelle; 3, Sagittal suture; 4, 4, Coronal suture; 5, Lambdoid suture; 6, 6, Parietal bones; 7, 7, Two halves of the frontal bone, still ununited; 8, Occipital bone.

branous capsule, which has been already described as thrown round the brain, and capable of enlarging with it. This is speedily followed by the deposition of ossific matter at various points of the capsule, which soon becomes converted into flakes of bone, which afford protection for the brain, while the intervening portions, which remain membranous, permit the skull to expand as its contents enlarge. The formation of these bony flakes on the convexity of the cranium is soon followed by the appearance of osseous nuclei in the cartilage at the base, corresponding to the future occipital and sphenoid bones. Lastly, the various bones, some originating in membrane, and some in cartilage (as described in the article OSSIFICATION), approach one another by gradual enlargement, and become united in various ways, so as to form a continuous, and ultimately an unyielding bony case, which, in the words of Dr. Humphrey, "is admirably adapted for the defense of the brain, for the accommodation of the organs of special sense, and for the attachment of the ligaments and muscles by which the skull is supported and moved on the spine."—*The Human Skeleton*, p. 185. At the period of birth most of the principal bones have grown into apposition with their neighbors, forming the *sutures* (q.v.), but one large vacuity remains at the meeting-point of the parietal and frontal bones, which is termed the anterior fontanelle,* which does not close till the second year after birth, and sometimes remains open much longer. The deficiency of the osseous brain-case at this position not only facilitates the act of delivery, but also acts, according to Humphry, to some extent like a safety-valve during the first months of infantile life, at which time the brain bears an unusually large proportion to the rest of

* So called from the pulsations of the brain, which may be here seen, resembling the rising of water at a spring or fountain. There are two fontanelles in the mesial line, as shown in Fig 2, and two lateral fontanelles on either side.

the body, and is liable to sudden variations of size from temporary congestion, sudden wasting of its substance, and other causes. The sutures remain distinct long after the closure of the fontanelles, and probably serve a purpose both in permitting an increase of the size of the cranium by the growth of the bones at their edges (although the enlargement of the cranial cavity does not entirely depend upon this growth at the edges), and in diminishing and dispersing vibrations from blows, and thus contributing to the security of the brain.

The number of centers of ossification in the skull is tolerably constant; each bone having a certain number. (Thus the occipital has 7 centers, the temporal 5, the sphenoid 12, etc.; the total number being about 59). In addition to these, centers frequently occur in the course of the sutures, giving rise to independent pieces, which are called the *ossæ triquetra*, or the *Wormian bones*. They are regarded by Humphry as stop-gaps, developed in the membranous covering of the brain, when the extension of the regular osseous nuclei is likely, for some reason, to be insufficient to cover in the cranial cavity; and this view is supported by the observation that, in cases of rickets and hydrocephalus, the Wormian bones are especially abundant.

After the sutures have been formed, and the skull has acquired a certain thickness, a process of resorption commences in the interior of the bones, and reduces the originally dense structure to a more or less cellular or cancellated state. The interior thus altered is called the *diploe*, and by this change the weight of the skull is much diminished, while its strength is scarcely affected.

The diploe usually begins to be apparent about the tenth year, and is most developed in those skulls which are thickest. Dr. Humphry has observed it to be especially thick in idiots, and where the brain is small. "Hence," he observes, "the propriety of the term *thick-headed*, as a synonym for *stupid*, derives some confirmation from anatomy." A continuation of the same process of resorption, which causes the diploe, gives rise to the formation of the cavities known as the frontal and sphenoid sinuses. The formation of the diploe divides the walls of the cranium into three layers, viz., an outer tough layer; an inner dense, brittle, and somewhat glass-like layer, known as the vitreous table or layer; and the intervening cancellous diploe. The vitreous table being more brittle than the outer layer, is apt to be fissured to a greater extent in fracture of the skull; and is even sometimes broken while the outer layer, which received the blow, has remained entire; although the diploe must have great power in lessening the concussions transmitted from the outer to the inner layer of the skull. The growth of the skull after the seventh year proceeds slowly, but a slight increase goes on to about the age of twenty. The skull-bones are freely supplied with blood from arteries which pass from the dura mater internally and the pericranium externally, through the numerous foramina observed on both surfaces; the blood being returned by veins which take various directions.

The fact that concussion of the brain scarcely ever proves fatal, unless there is also fracture of the skull, affords the most distinct evidence that the skull is constructed in such a manner that so long as it maintains its integrity, it is able to protect its contents from serious lesion. This marvelous protective power is due to its rounded shape whereby its strength is increased, and in consequence of which blows tend to glide off it, without doing material damage. Moreover, the curved lines or ridges which may be traced round the skull tend to strengthen it. The weakest part of the skull is at the base. Hence, notwithstanding its removal from exposure to direct injury and the protection afforded by the soft parts, fracture takes place more frequently at the base than at any other part of the skull, fracture often taking place here even when the skull was not broken at the part struck. There are two points in the architecture of the bones of the face which deserve especial notice, viz., (1) the great strength of the nasal arch, and (2) the immobility of the upper jaw, which is fixed by three buttresses, the nasal, the zygomatic, and the pterygoid.

The base of the skull, whether seen from within or from below, presents many objects of physiological interest in relation to the nervous system. As seen from within, the base presents on each side three fossæ, corresponding to the anterior and middle lobes of the cerebrum and to the cerebellum. These fossæ are marked, as is the whole skull-cap, by the cerebral convolutions, and they contain numerous "foramina" and "fissures" which give passage to various sets of nerves and blood-vessels. The external or outer surface of the base of the skull, if we consider it from before backward, is formed by the palate processes of the superior maxillary and palate bones; the vomer; the pterygoid and spinous processes of the sphenoid and part of its body; the under surface of the temporal bones, and by the occipital bone. The hard palate is formed by the palate processes of the superior maxillary bone.

The anterior region of the skull, which forms the face, is of an irregularly oval form, and the bones are so arranged as to inclose the cavities for the eyes, the nose, and the mouth, and to give strength to the apparatus for masticating the food. The size of the face and the capacity of the cranial cavity stand in an inverse ratio to one another, as may be readily seen by comparing vertical sections (through the mesial line) of human and other mammalian skulls; and if, in place of mammalian skulls, we take skulls of lower vertebrates (the crocodile, for example), this ratio is far more striking. In man the face is at its *minimum* as compared with the cranial cavity, chiefly in consequence

of the facial bones being arranged in a nearly vertical manner beneath the cranium, instead of projecting in front of it. The human face is also remarkable for its relatively great breadth, which allows the orbits for the reception of the eyes to be placed in front instead of on the sides of the head, and renders their inner walls nearly parallel. "This parallelism," says Dr. Humphry, "in man is associated with the parallelism of the optic axes, and contributes to that clear, accurate, and steady vision which results from the ready convergence of the eyes upon every object." Each orbit is of a pyramidal form, with the apex behind, and is composed of seven bones—viz., the frontal, ethmoid, lachrymal, sphenoid, superior maxillary, malar, and palate, which last contributes very slightly to the human orbit, but is an important constituent in the orbit of many animals. The nasal cavities have been sufficiently described in the article NOSE.

The different varieties of mankind present certain well-marked and characteristic peculiarities in the form of the skull. There are *three typical forms* of the skull which seem to be well established from the examination and comparison of a large number of crania—viz., the *prognathous*, the *pyramidal*, and the *oval or elliptical* cranium. When the upper jaw slopes forward, the insertion of the teeth, instead of being perpendicular, is oblique. A skull with this peculiarity is *prognathous* or *prognathic* (Gr. *pro*, forward, and *gnathos*, a jaw); the opposite condition being termed *orthognathous* or *orthognathic* (Gr. *orthos*, upright). The negro of the Guinea coast and the negrito of Australia present the prognathous character in its most marked form. The pyramidal form is characterized by the breadth and flatness of the face, which, with the narrowness of the forehead, gives this shape to the head. The Mongolian and Esquimaux skulls belong to this type. The oval or elliptical type is that which is presented by the natives of western or southern Europe, and which is not distinguished by any particular feature so much as by the absence of the longitudinal projection of the first type, or the lateral projection of the second, and by a general symmetry of the whole configuration. The length of the skull, which to a great degree corresponds to the degree of development of the posterior cerebral lobes, has been taken by the late prof. Retzius as a basis of classification. He arranges all the varieties of mankind into two great classes—the *dolicocephala*, or *long-heads*, whose cerebral lobes completely cover the cerebellum; and the *brachycephala*, or *short-heads*, in whom the cerebral lobes do not extend so far. Each of these classes contains *orthognathous* and *prognathous* varieties. See ETHNOLOGY.

The *Morphology of the Skull* is the highest and most difficult problem of comparative anatomy. Huxley destroyed the archetypal theory, previously held by Owen and others, and established the newer theory on sure grounds of actual observation. Taking first the unsegmented cranium of a skate or dog-fish, with its appended jaws and arches, we find that in development, though the notochord extends into the region of the head, the vertebræ stop short of it; but that on each side of the cranium there arise a pair of cartilaginous bars the *trabeculae* or "rafters" of the future skull, three pairs of cartilaginous capsules, nasal, ocular, and auditory, form round the developing sense organs; the nasal capsules unite with the ends of the trabeculae, which are meanwhile uniting below, and growing up at the sides to form the brain-case. The auditory capsules become united with the trabeculae by the appearance of two new masses of cartilage, the *parachordals*. The first pair of a series of seven or more arches develops an ascending process, becoming the "palato-ptyergoid" arch or upper jaw. The second pair of arches, the hyoid, is modified to support the jaws, while the rest are modified to support the gills. In the bony skulls of higher vertebrates the chondro-cranium and subjacent arches develop in the same way. The bones originate in two distinct ways: either by actual ossifications, or by the ossification of overlying dermis, known as cartilage bones and membrane bones respectively, the latter corresponding to the dermal bones and teeth of ganoid and elasmobranch fishes. In mammals, the ends of the mandibular and hyoid arches lose their suspensory function, are taken into the interior of the ear capsule, and are metamorphosed into the auditory ossicles. See references under SKELETON.

Fracture of the skull is an accident of such importance as to demand a special paragraph. As already remarked, fracture may take place either in the vault or at the base of the skull. We shall first consider *fractures of the vault*. Here the fracture is usually direct, the bone giving way at the point at which it was struck, and the result being either a simple fissure or a breaking of the bone into several fragments (a comminuted fracture). Although fractures may be limited to the outer or to the inner surface of the skull, they most commonly extend through the whole thickness, and the broken bone is generally driven inward; and the most ordinary form of fracture with depression is that in which several fragments of a somewhat triangular form have their points driven down and wedged into each other, while their bases remain on a level with the surrounding bone. There are no signs by which we can in all cases recognize the existence of fracture of the vault. "Fissures," says Mr. Prescott Hewett, "involving the whole thickness of the vault of the skull, constantly exist without ever having been suspected during life; and even an extensive and comminuted fracture, with great depression of the fragments, may, and often does, escape notice when the broken bone lies hidden under the temporal muscle or under a large extravasation of blood."—Holmes's *System of Surgery*, vol. ii. p. 116. When, however, the fracture is accompanied by a wound leading down to the bone it may, in general, be easily detected. With regard

to treatment, it is now an established rule that simple fractures of the skull with depression, and without symptoms, are to be let alone. The depression may be so marked as to be easily detected; and yet so long as there are no symptoms all operative interference, of whatsoever form, is carefully to be avoided."—Prescott Hewett, *op. cit.* If, however, there be a wound leading down to the bone in a depressed fracture without symptoms, immediate operative interference is called for. When a depressed fracture is accompanied by primary brain-symptoms, an operation for the purpose of raising or removing the depressed fragments is usually necessary. If, however, the fracture is a simple one, and the symptoms are not urgent, milder remedial agents, as bleeding, purging, and low diet may be first tried. Cases occasionally occur in which very urgent symptoms of cerebral pressure persist for a long time, and are relieved at once on the pressure being removed. A remarkable case is recorded by Cline (*Medico-Chir. Rev.*, vol. i. p. 471), in which a sailor remained in a state of unconsciousness for 13 months in consequence of a wound causing fracture and depression of one of the parietal bones. Cline trepanned the part and elevated the bone, and on the evening of the same day, the sailor sat up in bed, and though at first stupid and incoherent, soon became rational and well, upward of a year having elapsed in which his life was a complete blank.

Fractures of the base may be direct or indirect, but in most cases are indirect, that is to say, the bones give way at a point remote from the seat of the blow, as has been already shown. At certain parts, however, the bones of the base are so thin that if direct pressure be brought to bear upon them they readily give way. Thus scissors, slate-pencils, tobacco-pipes, etc., have often been thrust into the skull through the orbits or the nostrils, and these wounds are very serious, from the readiness with which the brain may be thus injured. The only symptoms that can be depended upon as indicating a fracture of the base of the skull are connected either with an escape of the substance of the brain, or blood, or watery fluid, or with an injury done to the nerves as they emerge at the base. Out of 32 cases of fractured base observed by Hewett, bleeding from the mouth or nose occurred in 14 and bleeding from the ear in 15 cases. A copious watery discharge from the ear was, until very recently, regarded as a diagnostic sign of fracture of the base; and there can be no doubt that when such a discharge of cerebro-spinal fluid occurs either from the ear or nostrils, that it *most probably* is connected with fracture. Operative interference is very seldom required in these fractures, our treatment being directed not against the broken bones, but against the accompanying cerebral lesions.

SKULLCAP, a genus (*scutellaria*) of herbs of the mint family (*labiate*). The generic characters are: calyx bell-shaped when in flower, two-lipped, the upper lip with a helmet-like appendage; calyx splitting at the base at maturity, the upper lip usually falling away; corolla having an elongated curved ascending tube, dilated at the throat, two-lipped; stamens four; anthers approximate in pairs and bearded. The following species grow in the United States: *S. versicolor*, from 1 to 3 ft. high, stem erect, leaves heart-shaped; river banks from Pennsylvania to Wisconsin and southward: *S. saxatilis*; stem weak, from 6 to 18 in., sometimes having runners; leaves heart-shaped, crenate, from 1 to 2 in. long; growing on moist shady banks in southern Ohio, Virginia, and Kentucky, and on mountains farther south: *S. canescens*; 2 to 4 ft. high, stem-branched above, with panicle, many-flowered racemes; lance-ovate, crenate leaves, whitish, with fine soft down; upper lip of corolla shorter than lower; rich soil from Pennsylvania to Illinois and southward: *S. serrata*; stem from 1 to 3 ft. high, simple, with single, loosely flowered racemes; leaves ovate, serrate, and acuminate at both ends; corolla one inch long, lips equal; growing in woods from Pennsylvania to Illinois and southward: *S. pilosa*; stem simple, 1 to 3 ft. high; leaves oblong-ovate, crenate; racemes short; corolla rather narrow; growing on dry ground in southern New York to Michigan and southward: *S. lateriflora* is a species which has been used as a quack medicine in hydrophobia, and bears the common name of mad-dog skullcap. It has a smooth, upright stem, much branched; 1 to 2 ft. high; leaves lanceolate-ovate, coarsely serrate; growing in wet, shady places in many parts of the United States. Other species are *S. integrifolia*, *S. nervosa*, *S. parvula*, and *S. galeiculata*.

SKUNK, *Mephitis*, a genus of quadrupeds of the weasel family (*mustelidae*), but departing very considerably from the typical characters of that family, and approaching to the badgers and gluttons in general appearance, in habits, in the lengthened claws of the fore-feet, in the plantigrade hind-feet, and in some of the teeth. There are six incisors and two canine teeth in each jaw, eight molars in the upper, and ten in the lower; the teeth generally resemble those of the polecat. Skunks depend very much for defense against enemies on an excessively fetid fluid, which is secreted by glands near the anus; and when assailed, they turn the rump toward the assailant, elevate the tail, and discharge this fluid with considerable force. The odor proceeding from it, even when a dead skunk has been flung into an inclosure, has been known to cause nausea to the inmates of an apartment with closed windows at the distance of 100 yards. So confident does the skunk seem of the efficacy of its peculiar mode of defense, that it permits itself to be approached till it is just on the point of being seized, which, however, is only attempted by the inexperienced, when the battery is discharged. It is almost impossible to remove the odor from clothes. Dogs flee at once, and rub their

noses on the ground till they bleed. Dogs that are aware of the skunk's powers, however, kill it by leaping upon it suddenly, and in such a way that they are not exposed to danger. There is much uncertainty concerning the species of skunk, as the colors vary considerably even in the same species; but there is no doubt of the existence of a number of species. They are found only in America, where they are very widely distributed from Hudson's Bay to the Strait of Magellan. The COMMON SKUNK (*M. Americana* or *varians*) is about the size of a cat, generally black or blackish brown, with white streaks along the back. It inhabits burrows which it makes in the earth, feeds on mice, frogs, etc., and also on insects and fruits; and sometimes enters houses to plunder store-rooms, where, if it is suddenly alarmed, everything is tainted with an intolerable odor. White streaks on the back, one or more, are very characteristic of this genus.

SKUNK CABBAGE, sometimes called dracontium, and by the Germans, *stinkende drachenwurz*. It is the *symplocarpus foetidus*, a plant belonging to the arum family, growing in bogs and moist ground in many parts of North America. It blossoms in April and May. The spathe, which precedes the leaves, is hooded, shell form, pointed, rather fleshy, of a variegated purplish brown and yellow color, inclosing a short oval spadix, which is densely tessellated with fleshy flowers, and enlarges to a spongy mass, which superficially covers the globular seeds. The leaves are radical, 18 to 24 in. long, on short leaf-stalks, smooth, ovate, heart-shaped. All parts of the plant emit a fetid odor, especially when bruised, which has some resemblance to the fetid secretion of the skunk. The fruit is ripe in September, forming a roughened, globular mass 2 or 3 in. in diameter, containing many round seeds nearly half an inch in diameter, filled with a solid fleshy embryo. Skunk cabbage, or dracontium, taken internally produces vertigo, nausea, and frequently vomiting. It has been used in hysteria, chorea, and spasmodic asthma, but it is probably much less efficient than many other medicines, and is not often used by the profession. The root is the part used, and should be collected early in the spring.

SKUPTSCHINA (more freely, *Narodna Skuptschina*, "National Assembly"). The name given in Serbia to the national parliament. See **POLITICAL PARTIES, SERBIAN**.

SKYE (Gaelic *skianach*, winged), the largest of the Scottish islands after Lewis, and the most northerly of the group known as the inner Hebrides, forms part of the county of Inverness, from the mainland of which it is separated by a channel scarcely half a mile in breadth at its narrowest point, Kyle Rhea. Its extreme length, from s.e. to n.w., is 47 m.; breadth, from 7 to 25 m.; but on account of the extraordinary number of inlets at all parts of the island, no point is above 4 m. from the sea. Area, 535 sq.m.; pop. '91, 15,705. Skye is for the most part mountainous and moory, but it contains some pleasant tracts of arable and pasture land, and one considerable plain, formerly the bed of a lake, in the parish of Kilmuir. The principal mountains are the Coolin Hills, which stretch irregularly chiefly from s.w. to n.e., culminating in the sharp peak of Scoor-nan-Gillea (3,167 ft.) above Sligachan. Another peak, Scoor Dearg, has been found to be the highest of the range (3,233 feet). The singularly jagged outline of these remarkable hills is a well-known landmark to mariners far out at sea. The most famous scene in this region is loch Coiruisg, a small fresh-water lake near the head of the bay of Scavaig, all but encircled by frowning ridges of rock, shooting up at some points to the height of 3,000 feet. It has been powerfully depicted by sir W. Scott in *The Lord of the Isles*. Glen Sligachan, extending from the head of the loch of that name about 9 m. to Caumsunary, is considered the grandest glen in the highlands. The scenery of Cuiraing, near the n. of the island, has been truly styled "unique." The coast-scenery of Skye is for the most part highly picturesque, and in many places very grand. Between Rhu-nam-Brarin and loch Staffin, the coast-line presents magnificent basaltic formations, on a scale of magnitude considerably exceeding the giants' causeway or Staffa. Over these cliffs descend many remarkable waterfalls, and their bases are frequently worn into deep caves, some of which are of historical interest. One near Portree afforded a refuge to prince Charles; another, on the w. coast, was the temporary prison of lady Grange. The largest arms of the sea are loch Bracadale, loch Dunvegan, and loch Snizort; and the chief harbors are those of Portree, Uig, Grishinish, Lochbay, Dunvegan, Pooltiel, and Harport.

The coasts abound in fish, the most important being herring, cod, ling, and saithe. Good oysters are found in several places. The herring fishery is prosecuted in the season in all the bays: the cod and ling fishery is chiefly confined to loch Dunvegan and loch Snizort; and the salmon fishery to Portree and the e. coast. Lobster-fishing is also carried on to a considerable extent. There are no rivers of any magnitude; but salmon and sea-trout are got in some of the principal streams, at Skeabost, Portree, Ose, Hammer, &c. The fresh-water lakes are also small, and few in number. Deer are not numerous, nor are grouse. An excellent breed of hardy ponies used to be extensively reared, but the cultivation of sheep now engrosses almost exclusive attention from farmers. The climate of Skye is exceedingly moist, the days throughout the year during which no rain falls being generally few in number. The mean annual rainfall is 81.75 in. The climate is, however, mild and healthy, and the average standard of longevity uncommonly high.

The inhabitants are for the most part poor. In the districts where the men practice fishing, nearly the whole of the adult males go to the Caithness fisheries in summer, while from all parts of the island young men and women go in troops to the s. in search of field-labor. Potatoes and fish are the general diet, meat being a rare luxury. The population is chiefly Celtic, with, however, a considerable mixture of the Norse element. Gaelic is still universally spoken, but is gradually giving place to English. The chief proprietors are still, as of old, lord Macdonald, whose seat, Armadale castle in Sleat, is one of the most beautiful in all its surroundings to be seen on the Scottish coasts, and Macleod of Macleod, whose ancient castle of Dunvegan, picturesquely seated on a rock, has been pleasantly commemorated by Dr. Johnson and sir Walter Scott. Around these residences are the principal plantations to be seen in Skye. The principal port of Skye is Portree, a picturesquely situated village, to which steamers regularly ply from Glasgow. Other villages, also calling-points of the steamers, are Kyleakin (Hakon's strait), Broadford, and Dunvegan. The principal exports are cattle and sheep, wool, fish, shell-fish, and eggs. At Portree there is a flourishing tweed manufactory, the only one in the island. The celebrated whiskey known as "Talisker" is manufactured at Carabost. The inhabitants are, with the exception of a few families, all Presbyterians, and, as in the rest of the highlands, chiefly adherents of the free church. Of the smaller islands near Skye, the chief are Raasay, Ronay, Scalpay, Pabbay, Soay, all of which are inhabited. See Boswell's *Tour in the Hebrides*; Smith's *Summer in Skye*.

SKYRO, or **SCYRO**, an island of the Grecian archipelago, the largest member of the northern Sporades, 25 m. e. of cape Koumi, Eubœa. Its length is 19 m.; area estimated at about 60 sq. miles. Skyros is very mountainous and uncultivated in the s., but the northern part, though also hilly, has several fertile plains, which produce as fine wheat as any grown in the archipelago. The only town in the island is Skyro, or St. George, which is built on a high peak on the eastern coast, the broad summit of which is occupied by the ruins of a castle, and was the site of "the lofty Seyros" of Homer. There are several relics of antiquity on the island. Pop. '89, 3188.

SLAGS, called otherwise scorïæ or cinders, are fused compounds of silica in combination with lime, alumina, or other bases; and result as secondary products from the reduction of metallic ores. More or less of the metal always remains in a slag; in the early days of iron-smelting, the proportion of metal thus wasted was so great that some old slags have been profitably smelted in recent times. Slags being silicates, are of the nature of glass, and externally have a glassy, crystallized, or stone-like character. Beautifully crystallized specimens are occasionally to be met with at smelting-works. They vary very much in color, and are sometimes so prettily veined and marbled, that attempts have been made to apply them to ornamental purposes. Millions of tons of slag are annually produced at the iron-smelting works of Great Britain, but almost the only use to which it has yet been successfully applied is in the making of square blocks or bricks for building purposes. The slag is run into molds, either as it issues from the blast-furnace, or after being remelted; and it is found to be a very durable material. Broken slag is also used as a covering for roads, but its brittleness and sharpness are objectionable qualities for this purpose. Several patents, beginning so far back as 1728, have been taken out for casting slag into articles of a more ornamental kind, but hitherto they have not been commercially successful.

In an archæological point of view, slags are interesting as pointing out the sites of ancient smelting-works, and as affording a clue to the primitive methods of obtaining the metals from their ores.

SLANDER is an injury to a person's character and reputation caused by spoken words. It is difficult to define what kind of injuries of this nature are actionable, but in general whatever imputes disgraceful, fraudulent, or dishonest conduct, or even tends to make a man contemptible in his private relations, and shunned by his friends and neighbors, is a slander. Thus, whatever imputes a crime, or indictable offense, or a contagious disease, is a slander. There are some epithets, however, which are not actionable unless some special damage is directly caused thereby, as calling a man a scoundrel, swindler, rogue, gambler, liar, etc. To call a woman a whore is also not actionable, unless she can show that she has lost offers of marriage, etc., thereby. Words imputing gross ignorance or misconduct affecting one's trade or profession are, however, actionable, as calling a man a bankrupt grocer, a quack doctor, etc. See also **LIBEL**. The remedy for slander is an action at law for damages. Though certain words when spoken will not amount to slander, yet, if printed or written, they will sometimes become so, as calling one a rogue, swindler, rascal, etc.

Words that are properly actionable in themselves, without proof of special damage, must "impute," according to Heard, *Libel and Slander*, § 24, "the commission of a crime involving moral turpitude, and which is punishable by law." Words spoken of one in office and tending to cause the loss of that office, or words imputing want of ability or capacity in business, or words imputing to a man a disease or distemper which renders him unfit for society, are likewise actionable without proof of special damage. In the case of words not actionable in themselves, special damage must be specified in the declaration. To make words actionable they must be uttered without legal cause. But some communications are privileged. The slander must be com-

municated to a third person. Malice is essential, but will be inferred in the absence of evidence to the contrary. The falsity of the charge will be inferred till the contrary is shown. A repetition of oral slander, already in circulation, without any expression of an opinion as to its truth, is actionable.

SLANG, once assumed to have been borrowed from the gypsy tongue, but derived by Skeat from a Scandinavian source. In its usual signification it denotes a burlesque style of conversational language, originally found only among the vulgar, but now more or less in use in this country among persons in a variety of walks in life. It is somewhat allied to, though not identical with, *cant* (in French *argot*), the language used for purposes of concealment by thieves and vagrants of all descriptions.

Slang is not exclusively of modern date. It was known in the classic ages of Greece and Rome, and abounds in the writings of Aristophanes, Plautus, Terence, and Martial. Every modern European language has its slang. In England, the "rump," and the "barebones parliament," the terms "Roundheads," "Puritans," "Quakers," all belonged to the slang of the 17th century. *Hudibras* and the dramatic works of last century abound in slang. Old English slang was coarser than that now in use, but the greater portion of its phraseology had a somewhat restricted circulation, not permeating every species of conversation to the extent that modern slang does. Toward the close of last century the slang vocabulary received large additions from pugilism, racing, and "fast life;" and its fashionable vulgarisms came into great favor during the minority of the prince regent. In the present century the growth of refinement in manners and ideas has not banished slang, but given it a more familiar and utilitarian character, while it has been introduced in some measure into circles where it was formerly unknown.

Slang consists in part of new words, and in part of words of the legitimate language invested with new meanings, such as are assigned to the verbs to *cut*, to *do*. Many slang expressions are derived from thieves' cant, and some from the gypsy tongue. Their derivations are often indirect, arising out of fanciful allusions and metaphors, which soon pass out of the public mind, the word remaining, while its origin is forgotten. The origin of much of the current slang may be traced to the universities of Oxford and Cambridge, and the great public schools of England. There is not an institution connected with the university which has not its slang equivalent (e.g., "plucked," "little go").

There is a slang attached to various professions, occupations, and classes of society. The slang of English fashionable life and fashionable novels comprises a number of French words and phrases, whose application is often very different from what is current in France. The *beau monde*, a *chaperon*, a marriage being on the *tapis*, are expressions which, in their English sense, are utterly unknown in Paris. To the slang of military life Hindustani has contributed its quota of words, imported by officers who have resided long in India. There is also parliamentary slang, religious slang, literary slang, civic slang, and shopkeepers' slang.—Many curious details regarding slang in all its departments are to be found in Hotten's *Slang Dictionary* (Lond., 2d ed., 1885).

SLATE, or **CLAY-SLATE** (Fr. *eschat*, a shiver or splinter), is a highly metamorphosed argillaceous rock, fine-grained and fissile, and of a dull blue, gray, green, or black color. It splits into thin laminae or plates, that are altogether independent of the layers of deposit; though sometimes coinciding with them, they more frequently cross them at different angles. See **CLEAVAGE**. Some rocks that split into the thin plates of the original stratification are popularly but erroneously named slate, as the thin bedded sandstones properly called flagstones or tilestones, the fissile shales of Cambrian and Silurian age, and the metamorphic, gneiss, and mica schist, whose planes of division correspond to their stratification. True slate is a very compact rock, little liable to be acted upon by atmospheric agencies. It is chiefly obtained from paleozoic strata, but it is found also among more recent rocks. It is used for various purposes, being split into thin slabs of small size for the roofing of houses, and into larger slabs for fitting up dairies, etc., and even for making billiard-tables, and split and polished by means of pumice for writing-slates.

In roofing with slates it is necessary to put on the slates in two thicknesses, so that the sloping joints may be covered by the overlap of the course above. Besides this, the third course must also cover the first by an inch or two, to prevent rain from penetrating. Slates are generally laid upon boarding, and bedded in lime, and nailed with malleable-iron nails, japanned, so as to prevent them from rusting. When large strong slates are used, they may be nailed to strong laths in place of boarding.

SLATE-PENCILS are either cut or turned sticks of slate, or they are made by pressing moistened slate-powder until it is firm enough to be made into pencils.

SLATER, JOHN FOX, 1815-84; b. R. I.; d. Norwich, Conn.; was the son of John Slater, who, with his brother Samuel, founded the cotton manufacturing industry in the U. S. He became interested with his father in the cotton business and inherited from him a mill at Jewett City, Conn. With this as a nucleus he amassed a large fortune, and won national distinction by his gift, 1882, of \$1,000,000, which he placed under an admirable plan of administration for the education of the freedmen of the South, known as the Slater fund. Besides his large interests in cotton manufacture, he was prominently connected with various banking and railroad enterprises.

SLATER, SAMUEL, 1768-1835; b. England; apprenticed in 1782 to Strutt, Arkwright's partner in cotton spinning, and learned the business. Having heard of a United States law to promote manufactures, and of the bounty offered by the Pennsylvania legislature for the introduction of the Arkwright patents into this country, he came to New York in 1789. Going to Providence at the request of Moses Brown of that place, who had made some experiments in cotton-spinning machinery, he contracted to build and run the machinery required, and in 1790 started a mill at Pawtucket with 72 spindles and 3 carding-machines. The cotton manufacture of this country dates from that time. He afterward built cotton-mills of his own at what is now Webster, Mass., and erected woolen mills at the same place, 1815-16. He thus built up the village of Slatersville, where his descendants still carry on a prosperous business. He was a liberal employer, and established schools for the children of his workmen. He had to rely solely upon his memory to reproduce the Arkwright machinery, the English laws forbidding the exportation of models. For some time he could not recall an important mechanical detail, which finally occurred to him in a dream.

SLAVE-COAST, a division of the coast of Upper Guinea, Africa, lying between the rivers Volta and Lagos. See **GUINEA**.

SLAVERY. A slave is an individual who is the property, or at the disposal of another, who has a right to employ or treat him as he pleases. Such is the state of the slave in the most absolute sense of the term; but slavery has been subjected to innumerable limitations and modifications.

Slavery probably arose at an early period of the world's history out of the accident of capture in war. Savages, in place of massacring their captives, found it more profitable to keep them in servitude. All the ancient oriental nations of whom we have any records, including the Jews, had their slaves. The Hebrews were authorized by their law to possess slaves, not only of other races, but of their own nation. The latter were generally insolvent debtors, who had sold themselves through poverty, or thieves who lacked the means of making restitution; and the law dealt with them far more leniently than with stranger slaves. They might be redeemed; and if not redeemed, became free in the space of seven years from the beginning of their servitude; besides which, there was, every fiftieth year, a general emancipation of native slaves.

Slavery existed in ancient Greece: in the Homeric poems, it is the ordinary destiny of prisoners of war; and the practice of kidnapping slaves is also recognized—Ulysses himself narrowly escaping a fate of this kind. None of the Greek philosophers considered the condition of slavery objectionable on the score of morals. Aristotle defends its justice on the ground of a diversity of race, dividing mankind into the free and the slaves by nature; while Plato only desires that no Greeks should be made slaves. One class of the Greek slaves were the descendants of an earlier and conquered race of inhabitants, who cultivated the land which their masters had appropriated, paid rent for it, and attended their masters in war. Such were the Helots in Sparta, the Penestæ in Thessaly, the Bithynians at Byzantium, etc., who were more favorably dealt with than other slaves, their condition somewhat resembling that of the serfs of the middle ages. They could not be sold out of the country, or separated from their families, and were even capable of acquiring property. Domestic slaves obtained by purchase were the unrestricted property of their owners, who could dispose of them at pleasure. In Athens, Corinth, and the other commercial states, they were very numerous, and mostly barbarians. They were employed partly in domestic service, but more as bakers, cooks, tailors, or in other trades, and in mines and manufactories; and their labor was the means by which the owner obtained profit for his outlay in their purchase. These slaves were, for the most part, purchased; but few were born in their master's family, partly from the general discouragement of the cohabitation of slaves, and partly from the small number of the female in comparison with the male slaves. An extensive traffic in slaves was carried on by the Greek colonists in Asia Minor with the interior of Asia; and another source of supply arose from the practice common among Thracian parents of selling their children. In Greece in general, and especially at Athens, slaves were mildly treated, and enjoyed a large share of legal protection. According to Demosthenes, a slave at Athens was better off than a free citizen in many other countries.

The Roman condition of slavery differed in some particulars from that of Greece. All men were considered by the Roman jurists to be free by natural law; while slavery was regarded as a state contrary to natural law, but agreeable to the law of nations, when a captive was preserved, instead of being slain (hence the name *servus*, quasi, *servatus*); or agreeable to the civil law, when a free man sold himself. In earlier times, there was no restriction on the master's power of punishing or putting to death his slave; and even at a later period, when the law on this head was much modified, slaves were used with considerable rigor. The estimation in which their lives were held is illustrated by the practice of gladiatorial combats, as also by the conduct of Vedius Pollio, who, in the polite age of Augustus, flung such slaves as displeased him into his fish-ponds, to feed his lampreys, and on the matter being brought under the emperor's notice, was visited with no severer punishment than the destruction of his ponds. Old and useless slaves were often exposed to starve in an island of the Tiber. Under the empire, the cruelty of masters was in some degree restrained by law. It was enacted, that a man who put

to death his own slave without cause should be dealt with as if the slave had been the property of another; and that if the cruelty of the master was intolerable, he might be compelled to sell the slave. A constitution of Claudius declared the killing of a slave to be murder, and it was also enacted, that in sales of slaves, parents and children, brothers and sisters, should not be separated. A slave could not contract marriage, and no legal relation between him and his children was recognized. The children of a female slave followed the status of their mother. There was various ways in which a slave might be manumitted, but the power of manumission was restricted by law. The harboring of a runaway slave was illegal. The number of slaves in Rome, originally small, was increased much by war and commerce; and the cultivation of the soil came, in the course of time, to be entirely given up to them. During the later republic and empire, persons in good circumstances kept an immense number of slaves as personal attendants; and the possession of a numerous retinue of domestic slaves was matter of ostentation—200 being no uncommon number for one person. A multitude of slaves were also occupied in the mechanical arts and the games of the amphitheater. Originally, a slave was incapable of acquiring property, all his acquisitions belonging to his master; but when slaves came to be employed in trade, this condition was mitigated, and it became the practice to allow a slave to consider part of his gains, called his *peculium*, as his own, a stipulation being sometimes made that he should purchase his freedom with his *peculium*, when it amounted to a specific sum.

Though the introduction of Christianity did not do away with slavery, it tended to ameliorate the condition of the slave. Justinian did much to promote the eventual extinction of slavery; and the church excommunicated slave-owners who put their slaves to death without warrant from the judge. But the number of slaves again increased; multitudes being brought with them by the barbarian invaders, who were mostly Slavonian captives (whence our word *slave*); and in the countries which had been provinces of the empire, slavery continued long after the empire had fallen to pieces, and eventually merged into the mitigated condition known as serfdom, which prevailed all over Europe in the middle ages, and has been gradually abolished in modern times. See SERF. But though the practice of selling captives taken in war as slaves ceased in the Christian countries of Europe, a large traffic in slaves continued among Mohammedan nations, by whom Christian captives were sold in Asia and Africa; and in the early middle ages the Venetian merchants traded largely in slaves, whom they purchased on the coast of Slavonia, to supply the slave-markets of the Saracens.

The negro slavery of modern times was a sequel to the discovery of America. Prior, however, to that event, the negroes, like other savage races, enslaved those captives in war whom they did not put to death, and a considerable trade in slaves from the coast of Guinea was carried on by the Arabs. The deportation of the Africans to the plantations and mines of the New World doubtless raised the value of the captive negro, and made slavery rather than death his common fate; while it may also have tempted the petty princes to make war on each other, for the purpose of acquiring captives, and selling them. The aborigines of America having proved too weak for the work required of them, the Portuguese, who possessed a large part of the African coast, began the importation of negroes, in which they were followed by the other colonizers of the New World. The first part of the New World in which negroes were extensively used was Hayti, in St. Domingo. The aboriginal population had at first been employed in the mines; but this sort of labor was found so fatal to their constitutions that Las Casas, bishop of Chiapa, the celebrated protector of the Indians, interceded with Charles for the substitution of African slaves as a stronger race; the emperor accordingly, in 1517, authorized a large importation of negroes from the establishments of the Portuguese on the coast of Guinea. Sir John Hawkins was the first Englishman who engaged in the traffic, in which his countrymen soon largely participated, England having exported no fewer than 300,000 slaves from Africa between the years 1680 and 1700, and between 1700 and 1786, imported 610,000 into Jamaica alone. The slave-trade was attended with extreme inhumanity; the ships which transported the negroes from Africa to America were over-crowded to such an extent that a large proportion died in the passage; and the treatment of the slave after his arrival in the New World depended much on the character of his master. Legal restraints were, however, imposed in the various European settlements, to protect the slaves from injury; in the British colonies, courts were instituted to hear their complaints; their condition was to a certain extent ameliorated, and the flogging of women was prohibited. But while slavery was thus legalized in the British colonies, it was at the same time the law of England (as decided in 1772 in the case of the negro Somerset), that as soon as a slave set his foot on English soil he became free; though, if he returned to his master's country, he could be reclaimed.

Before the idea of emancipation was contemplated, the efforts of the more humane portion of the public were directed toward the abolition of the traffic in slaves. In 1787 a society for the suppression of the slave-trade was formed in London, numbering Messrs. W. Dellwyn, Thomas Clarkson, and Granville Sharp among its original members. The most active parliamentary leader in the cause was Mr. William Wilberforce, whose views were seconded by Mr. Pitt. In February, 1788, an order of the crown directed that an inquiry should be made by a committee of the privy-council into the state of the slave-trade; and an act was passed to regulate the burden of slave-ships, and otherwise dimin-

ish the horrors of the middle-passage. A bill introduced by Mr. Wilberforce for putting an end to the further importation of slaves was lost in 1791. Meanwhile, the conquest of the Dutch colonies having led to a great increase in the British slave-trade, an order in council in 1805 prohibited that traffic in the conquered colonies; and in the following year, an act was passed forbidding British subjects to take part in it, either for the supply of the conquered colonies or of foreign possessions. In the same year, a resolution moved by Mr. Fox for a total abolition next session, was carried in the commons, and on lord Granville's motion, adopted in the lords; and the following year, the general abolition bill, making all slave-trade illegal after Jan. 1, 1808, was introduced by lord Howick (afterward earl Grey) in the house of commons, was carried in both houses, and received the royal assent on Mar. 25, 1807. British subjects, however, continued to carry on the trade under cover of the Spanish and Portuguese flags; the slave-ships were more crowded than ever, from the necessity of avoiding capture, and the negroes were not unfrequently thrown overboard on a pursuit. The pecuniary penalties of the act were discovered to be inadequate to put down a traffic so lucrative as to cover all losses by capture. Mr. Brougham therefore, in 1811, introduced a bill, which was carried unanimously, making the slave-trade felony, punishable with 14 years' transportation, or from three to five years' imprisonment with hard labor. An act of 1824 declared it piracy, and as such, a capital crime, if committed within the admiralty jurisdiction; and the statute of 1837, mitigating the criminal code, left it punishable with transportation for life. Among the philanthropic projects due to the exertions of the anti-slavery society was the establishment of the colony of Sierra Leone, on the coast of Africa, which had been formed by the British government in 1787, in order to show the possibility of obtaining colonial produce without slave-labor, and after the abolition of the slave-trade, became a settlement for the negroes captured by British cruisers.

The United States of America abolished the slave-trade immediately after Great Britain, and the same was in the course of time done by the South American republics of Venezuela, Chili, and Buenos Ayres, by Sweden, Denmark, Holland, and during the hundred days after Napoleon's return from Elba, by France. Great Britain, at the peace, exerted her influence to induce other foreign powers to adopt a similar policy; and eventually nearly all the states of Europe have passed laws or entered into treaties prohibiting the traffic. The accession of Portugal and Spain to the principle of abolition was obtained by treaties of date 1815 and 1817, and by a convention concluded with Brazil in 1826, it was declared piratical for the subjects of that country to be engaged in the slave-trade after 1830. By the conventions with France of 1831 and 1833, to which nearly all the maritime powers of Europe have since acceded, a mutual right of search was stipulated within certain seas, for the purpose of suppressing this traffic. The provisions of these treaties were further extended in 1841 by the quintuple treaty between the five great European powers, subsequently ratified by all of them except France. The Ashburton treaty of 1842 with the United States provided for the maintenance by each country of a squadron on the African coast; and in 1845, a joint co-operation of the naval forces of England and France was substituted for the mutual right of search.

The limitation of the supply of negroes naturally led, among other good results, to a greater attention on the part of the masters to the condition of their slaves. But the attention of British philanthropists was next directed toward doing away with slavery altogether in the colonies. Societies were formed with this end, an agitation was set on foot, and attempts were made, for some time without success, to press the subject of emancipation on the house of commons. At length, in 1833, a ministerial proposition for emancipation was introduced by Mr. Stanley, then colonial secretary, and an emancipation bill passed both houses, and obtained the royal assent, Aug. 28, 1833. This act, while it gave freedom to the slaves throughout all the British colonies, at the same time awarded an indemnification to the slave-owners of £20,000,000. Slavery was to cease on Aug. 1, 1834; but the slaves were for a certain duration of time to be apprenticed laborers to their former owners. Objections being raised to the apprenticeship, its duration was shortened, and the complete enfranchisement took place in 1838.

The French emancipated their negroes in 1848; as did most of the new republics of South America at the time of the revolution; while the Dutch slaves had freedom conferred on them in 1863. In Hayti slavery ceased as far back as 1791, its abolition having been one of the results of the negro insurrection of that year. Slavery still exists in the Spanish and Portuguese colonies, but recent acts have been passed for its abolition. In Brazil a law for the gradual emancipation of slaves was passed in 1871. It enacted that from that date children born of slave women should be free; while, at the same time they were bound to serve the owners of their mothers as apprentices for twenty-one years. A recent treaty between Great Britain and the sultan of Zanzibar secures, in promise, the speedy abolition of the slave-trade on the opposite eastern coast of Africa. The expedition of sir Samuel Baker in 1873 was announced as having put an end to the slave-trade to the s. of Egypt, as far as the equator. How far the khedive was sincere in coupling this object with the conquest of the Nile regions is doubtful; and it is certain that most of his officers, and an army of slave-hunters, are bent on defeating the attempt. In 1874 the British governor at the Gold Coast, where domestic slavery still existed, announced that thenceforth no person could be sold as a slave in the protectorate or removed from it for that purpose.

In presence of the statement in the "Declaration of Independence," that "all men are born free and equal, and possess equal and inalienable rights to life, liberty, and the pursuit of happiness," the colonies which threw off the British yoke numbered several hundred thousand negro slaves, whose condition of slavery was expressly recognized in the constitution of the United States, as ratified in 1788, provision being there made for the rendition of fugitive slaves, a subject the regulation of which was delegated to the federal government, slavery being otherwise left to be governed by the laws of the states where it existed. Slavery established itself firmly in the southern states, where negro labor was required for the cultivation of sugar and cotton; and after the limitation of the supply from Africa, the breeding of slaves went on to a large extent in Maryland and Virginia for the supply of the other states of the south. The different positions of the northern and southern states regarding slavery, combined with other causes to engender that diversity of feeling and interest between north and south out of which arose the civil war. The politicians of the north, however, except a small section, by no means advocated the abolition of slavery where it already existed; they only objected to its extension to new territories. The increased consumption of cotton led to an increased demand for slave-labor; and in 1820, when Missouri was admitted to the union as a slave state, a compromise was entered into by which slavery was legalized to the south, but prohibited to the north of 36° 30' n. lat. (see MASON AND DIXON'S LINE). California, though partly lying s. of that geographical line, was admitted as a free state, the southern party obtaining in compensation the boon of an amendment of the fugitive slave law, making it penal to harbor runaway slaves or aid in their escape. A reaction against the policy of the south, and Mr. Lincoln's election as president, were the signals for a long-contemplated secession of the southern states, and the bloody war which ended in the overthrow of the principle of state-sovereignty and the consolidation of the union. In the course of the war many negroes were emancipated; and on Sept. 22, 1862, Mr. Lincoln issued a proclamation declaring all the negroes of secession masters who should not have returned to the union before Jan. 1, 1863, to be free. In January, 1865, Congress finally voted for an amendment to the constitution, abolishing slavery; and by the end of the year this had been approved by an overwhelming majority of the state legislatures. In the year 1776 there had been about 300,000 Africans imported into the British colonies in America, from the time of their first settlement. The number existing in the United States, according to the first census, 1790, was 697,897; every state in the union contributing except Massachusetts, which at this time included Maine. Ten years later the number had increased to 893,041; and in 1810 to 1,191,364. The succeeding decennial census showed the following figures as the existing number of slaves in the states at the dates mentioned:

1820.....	1,538,022
1830.....	2,009,043
1840.....	2,487,455
1850.....	3,204,313
1860.....	3,953,760

At the period of the organization of the national government the feeling of distaste for the institution of domestic slavery was strong in the southern states themselves, and prevalent throughout the union, though certain ship-owners of Boston and other parts of New-England found it to their interest to foster a state of things which was to them greatly remunerative. They supplied the slave-ships which transported the Africans from the points of departure on the w. coast of Africa, and grew rich on the traffic. But Vermont abolished slavery in 1777; Massachusetts in 1780; and Rhode Island and Connecticut gradually, both these states having a few slaves as late as 1840. New York finally abolished the institution in 1827; having gradually emancipated its slaves since 1799. New Jersey followed the same plan in 1804, and had 236 slaves still living in 1850. Pennsylvania commenced gradual emancipation in 1780, and in 1840 contained 64 slaves. The southern states had from the beginning found slaves more profitable to them than they could have ever possibly been in the north; and this fact alone had been sufficient to occasion the gradual centralization of the institution within the boundaries of those states. But the invention of the cotton-gin in 1793, by Eli Whitney, a Massachusetts man, increased the demand for labor, and specially increased the available uses of slave labor. In 1791 the entire cotton crop of the United States amounted to 2,000,000 pounds. In 1801 the crop was 48,000,000, of which nearly one-half was exported. In 1821 the crop was 180,000,000 pounds; in 1825, 255,000,000; and it continued to increase until, in 1860, it was 2,054,698,800 pounds. In the face of this tremendous accretion of a product representing a vast increase in the wealth of the country and of individuals, the feeble efforts of persons to oppose the continuance of what was esteemed the chief producing force, were of course futile. Washington, Jefferson, Franklin, Hamilton, and others of the leaders of public opinion in the early history of the country, were opposed to slavery on moral and religious grounds; and not less as a system calculated to become a retarding influence as to the progress of civilization and the general advancement of the people. And had not the invention of the cotton gin operated to encourage the perpetuation of the system, the opinions of such men would

have doubtless exercised their due weight in creating a profound and general public sentiment in antagonism to its existence. As it was, the question grew to be considered from this standpoint by humanitarians alone; while, having gradually become absorbed into the general party politics of the country, and connected with important points arising in relation to the accession of new territory, and its political status, its bearing eventually became national, and in a sense vital. The opponents of slavery began as early as 1775, with the formation of the Pennsylvania abolition society, their consistent resistance to the continuance and spread of slavery. By them, and from the period of the establishment of the *Liberator* in Boston, in 1831, under the leadership of William Lloyd Garrison, Wendell Phillips, Arthur Tappan, and other prominent men, a crusade against slavery was undertaken, which never ceased until victory had been achieved, and the last slave was freed. The formation of a political (free-soil) party in 1848 organized the various elements throughout the country which were in agreement on the main question; and candidates for the presidency on the broad platform of freedom for the slave assumed a position in national politics. Compromises began to be the only method for settling, even temporarily, questions whose complete recognition and conclusion seemed dangerous and impracticable in the existing and growing state of excited public feeling. The effort to extend slavery into the newly acquired territories was the rock on which the pro-slavery leaders eventually split; and the outbreak in Kansas, and the Fremont presidential campaign foreshadowed the serious character of the coming struggle. The "underground railroad," as it was called, the secret and persistent method of northern abolitionists to settle the question practically by absorbing the slaves into non-slaveholding communities, roused a bitterness of feeling in the south, which not even supreme court decisions and congressional enactments in favor of the slaveholders could allay. Missouri border ruffianism and "squatter sovereignty" were answered by Sharps's rifles, and at length the raid of John Brown at Harper's Ferry presented the "impending crisis," which the election of Lincoln made positive and present. The old antagonism between Puritan and cavalier; between manufacturing and agricultural interest; between a northern and a southern people, was now laid upon the shoulders of the institution of slavery. And the revolution which had become essential to clear the moral and political atmosphere of the country of all these varieties of antagonism, presented itself in the form of the civil war of 1861-65; and concluded so far as the existence of slavery was concerned, with the edict of President Lincoln of Jan. 1, 1863: see EMANCIPATION, PROCLAMATION OF. This proclamation had been suggested, and the minds of the people prepared for it, by the act of congress of March 13, 1862, which forbade the employment of military force to return fugitives to slavery; and that of July 16, 1862, authorizing the confiscation of the property of secessionists,—designedly meant to free the slaves. The proclamation had but little immediate practical effect except within the lines of the federal army; but it gave system and regularity to the treatment of the whole question; which had previously, in the hands of federal commanders, been sufficiently undefined and chaotic. See Gurowski, *Slavery in History* (1860); Wallon, *Hist. de l'Esclavage* (1879); Ingram, *History of Slavery* (1895); and ABOLITIONISTS; ANTI-SLAVERY SOCIETY; KANSAS; MISSOURI COMPROMISE.

SLAVES, or SLAVONIANS (native name *Slowene* or *Slowane*, derived by some from *slawa*, fame, but better from *slowo*, a word; thus meaning "speaking," or "articulate," as distinguished from other nations, whom they called *niemetz*, or "mutes"), the general name of a group of nations belonging to the Aryan family whose settlements extend from the Elbe to Kamtchatka, and from the Frozen sea to Ragusa on the Adriatic, the whole of eastern Europe being almost exclusively occupied by them. They were settled in these regions before the dawn of history, and are comprehended by ancient writers under the designations of Sarmatians and Scythians. The original names of the Slavic tribes seem to have been Winds or Wends (*Venedi*) and Serbs. The former of these names occurs among the Roman writers, and later, in Jornandes, in connection with the commercial peoples of the Baltic sea; the latter is spoken of by Procopius as the ancient name common to the whole Slavic stock. The earliest historical notices extant represent the Slaves as having their chief settlements about the Carpathians, from which they spread northward to the Baltic, westward as far as the Elbe and the Saal, and later, after the overthrow of the kingdom of the Huns southward beyond the Danube, and over the whole peninsula between the Adriatic and the Black sea. These migrations ceased in the 7th c.; the division of the Slavic stock into separate branches became now more complete, and gradually they began to form into independent states. The various sections of the stock may be divided into two groups—the south-eastern and the western; the first comprehends (1), Russians; (2), Bulgarians; (3), Illyrians (Serbs, Croats, Winds); the second (1), Lechs (Poles, Silesians, Pomeranians); (2), Czechs or Bohemians (Czechs, Moravians, Slovaks); (3), Polabians, comprising the Slavic tribes of n. Germany, who are fast disappearing, by being absorbed in the Teutonic population. With the exception of Russia and, since the Berlin congress of 1878, of Servia and Montenegro, the once numerous Slavic kingdoms (Bohemia, Bulgaria, Moravia, Poland, etc.), have lost their independent sovereignty and been incorporated in other states—chiefly Turkey, Austria, Prussia, and Saxony. The Polabians never attained any distinct political footing. The whole of the Slavic populations are estimated at upward of 80,000,000.

The Slaves are represented by ancient writers as an industrious race, living by agri-

culture, and the rearing of flocks and herds; as hospitable and peaceful, and making war only in defense. The feeling of nationality was strong among them. The government had a patriarchal basis, and chiefs or princes were chosen by assemblies. But contact with the feudal institutions of the Roman-German empire gradually altered this primitive constitution. The Slavic princes strove after unlimited power like that of the emperors; and the chiefs sought to dominate over the people like the feudal nobility. In the course of the 11th, 12th, and 13th c. nobility became a hereditary privilege throughout the Slavic states. The worst kind of feudalism fairly took root, and the people sank into the condition of serfs. Between them and the nobles there was no third or middle class, as the peculiar privileges of the nobility prevented the growth of cities. See SERF, RUSSIA.

The religion of the ancient Slaves, like that of the Teutonic nations, seems to have been, in many of its features at least, a kind of nature-worship; not, however, without the idea of a One supreme power, to whom the other agencies were subordinate. From this some authorities infer that the system was originally a monotheism which in process of time had become obscured and confused by the infusion of foreign elements, and thus degenerated into polytheism, and finally pantheism. The chief deity, whose worship seems to have been common to all the Slavic tribes, was Swiatowit, with whom were associated on a nearer footing of equality than the other gods, Perun and Radegast—if, indeed, these three names do not merely denote different personations or manifestations of the same power. In this trinity Swiatowit is considered as most analogous to Mars and Zeus, Perun to Jupiter and Thor, and Radegast to Mercury and Odin. Of the numerous gods of an inferior order we may name Prowe, god of justice; Prija (= Freya), Venus; Bjelbog, the white god, and Cernobog, the black god; together with multitudes of demons and spirits, good and bad. The images of the Slavic divinities (a stone statue of Swiatowit was in recent times discovered in eastern Galicia) had a striking resemblance to those of India. Swiatowit had four heads, Rugewit (the god of war) had seven faces, and Perun four, and so on. The Slaves seem to have been not without some crude notion of existence and retribution after death. Worship was performed in groves and temples, cattle and fruits being offered by the priests, whose office must have been originally performed by the head of the family or chieftain, as the common name for priest and prince (*kniaz*) shows.—The eastern Slaves received Christianity from Byzantium in the 9th c. through the instrumentality of Cyril (q.v.) and Methodius; the western, from Rome and Germany.—See Schafarik, *Slav. Alterthümer* (Ger. translation, Leip. 1843). See PANSLAVISM.

SLAVIC LANGUAGE AND LITERATURE. The term Slavic, as applied to language or race, is a generic name (like Celtic or Teutonic) for a group of kindred languages and peoples belonging to the great Indo-Germanic or Aryan family. In its roots and structure the Slavic language exhibits a remarkable similarity to Sanskrit, but has become European, so to speak, in the course of a long literary development, begun *before* that of any of the other European families. Its peculiarities are quite marked. The leading characteristics of the Slavic tongues are the completeness of their system of declensions, the want of articles, the absence of pronouns in the conjugation of the verb, pure vowel-endings, the fixed quantity of the syllables, the free construction of sentences, and the richness of their vocabulary. The earliest dialect of Slavic that received a literary culture was the "old-Bulgarian," better known as the "church Slavic," which, however, failed to become the literary vehicle for all the Slavic peoples, inasmuch as the special dialect of each gradually acquired a literature of its own. Altogether, writers reckon eight distinct extant dialects of Slavic—1. The "new Bulgarian;" 2. The Russian; 3. The Servian or Illyrian; 4. The Polish; 5. The Bohemian; 6. The Slovak; 7. The Wendic; 8. The Polabic. Such of these as merit special treatment have received it.—See **BOHEMIAN LANGUAGE AND LITERATURE**, **POLISH LANGUAGE AND LITERATURE**, **RUSSIAN LANGUAGE AND LITERATURE**, **SERVIA** (*Language and Literature*).—In regard to Slavic literature, considering the articles just mentioned, it is only necessary to state that at present the Russian branch of the Slavic is the richest in the number of its published works; but, as regards literary merit, the Polish ranks first, having cultivated with great success almost all sorts of literature, and possessing in particular a very exquisite poetry. The Bohemian and Servian literatures both contain many fine and distinctively original productions, worthy of being more widely known than they are.—See Schafarik's *History of the Slavic Language and Literature* (1816); and Miklosich's *Vergl. Grammatik der Slav. Sprachen* (Vienna, 1876).

SLAVONIA, a territory of Austria-Hungary, forming with Croatia a province of Hungary. It is bounded on the n. by the Drave, on the e. by the Danube, on the s. by the long strip of marsh-land known as the Slavonian military frontier, which stretches between it and the Save. Area of the province of Croatia (q. v.) and Slavonia, 16,773 sq. m.; pop. '90, 2,200,977. The greater part of the surface of Slavonia consists partly of eminences clothed with vines and fruit-trees, and partly of fertile and swampy plains. The mountains are rich in coal, marble, copper, iron, and lead. The principal products are all sorts of grain, particularly maize and wheat, leguminous plants, and fruit in abundance, apples, pears, plums, walnuts, chestnuts, melons, wine, etc. There is little manufacturing industry in Slavonia.—The inhabitants of Slavonia belong

to the Slavic family (see SLAVES), and call their land Slavonska; themselves Slavonaz. They speak the so-called Illyrian or Serviad tongue. See SERVIA (*Language and Literature*). The Slavonians proper are a handsome, tall, and slender race. The prevailing form of religion is the Roman Catholic, but the non-united Greek church also numbers many adherents. Education is still in a backward state. Capital of the country, Essek (q.v.).

SLEAFORD, a t. of Lincolnshire, England, on the right bank of the Slea, a branch of the Witham, 17 m. s.s.e. from Lincoln, and 52 ft. above the level of the sea. It is a well-built and well-paved town, and has a fine church, built in the 13th century. Pop. '91, 4655.

SLEEP. This term is employed to designate that state of suspension of the sensory and motor functions which appear to alternate in all animals with the active condition of those functions, and which may be made to give place to it by the agency of appropriate impressions upon the sensory nerves. This definition, which we have borrowed from Dr. Carpenter's article on "Sleep" in Todd's *Cyclopædia of Anatomy and Physiology*, may seem somewhat complex, but cannot be simplified without rendering it less stringent. The necessity for sleep arises from the fact that the exercise of the animal functions is in itself destructive of the tissues of the organs which minister to them, so that if the waste produced by their action were not duly repaired, they would speedily become unfit for further use; and it is on the nutritive regeneration of the tissues which takes place during true healthy sleep that its refreshing power depends. While the sensory and motor functions are suspended during the condition we designate as sleep, the organic functions are uninterruptedly carried on, the respiratory, cardiac, and peristaltic movements proceeding with equal uniformity during the sleeping and waking states.

There can be no doubt that the state of sleep is one to which there is a periodical tendency, and that this disposition is so arranged as to correspond in its recurrence with the diurnal revolution of the earth. Although in man and most animals night is, from its darkness and silence, the natural period for repose, yet there are numerous exceptions to the rule. For example, amongst lepidopterous insects, butterflies are active during the day, hawk-moths during the twilight, and moths during the night. Amongst birds, the goat-sucker, or night-jar, and the owls, are nocturnal, and, as a general rule, the same is the case with carnivorous animals. The causes of sleep may be divided into the direct and the predisposing. The direct cause of sleep is that feeling of exhaustion or fatigue which is usually experienced when the waking activity has continued during a considerable portion of the twenty-four hours—a feeling that the brain requires repose; and, in fact, unless the brain be in an abnormal condition, sleep will at last supervene, from the absolute inability of that organ to sustain any further demands upon its energy. Among the predisposing causes which favor the access of sleep, we must especially notice "the absence of sensorial impressions; thus darkness and silence usually promote repose; and the cessation of the sense of muscular effort which usually takes place when we assume a position that is sustained without it, is no less conducive to slumber."—Carpenter's *Human Physiology*, 6th ed. 1864, p. 592. On the other hand, persons accustomed to live where there is a continuous noise, as in the neighborhood of mills or forges, often cannot sleep if the noise is suspended. These cases, however, probably fall within the next general predisposing cause—namely, the *monotonous repetition* of sensorial impressions. Thus the droning voice of an unimpressive reader or preacher, the gentle ripple of the ocean, the hum of bees, the rustling of foliage, and similar monotonous impressions on the auditory nerves, are usually provocative of sleep. In these and similar cases the influence of the impressions is exerted in withdrawing the mind from the consciousness of its own operations, and in suspending the directing power of the will; and this is the case, says Dr. Carpenter, "even when the attention is, in the first instance, *voluntarily* directed to them, as in some of the plans which have been recommended for the induction of sleep, when there exists no spontaneous disposition to it. In other methods the attention is fixed upon some internal train of thought, which, when once set going, may be carried on automatically, such as counting numbers, or repeating a Greek verb. In either case, when the sensorial consciousness has been once steadily fixed, the monotony of the impression (whether received from the organ of sense or from the cerebrum) tends to retain it there; so that the will abandons, as it were, all control over the operations of the mind, and allows it to yield itself up to the soporific influence. This last method is peculiarly effectual when the restlessness is dependent upon some mental agitation, provided that the will has power to withdraw the thoughts from the exciting subject, and to reduce them to the tranquilizing state of a mere mechanical repetition."

The access of sleep is sometimes quite sudden, the individual passing at once from a state of complete mental activity to one of entire torpor. More generally, however, it is gradual, the mind while remaining poised, as it were, between sleep and the opposite condition being "pervaded by a strange confusion which almost amounts to wild delirium; the ideas dissolve their connection with it one by one; and its own essence becomes so vague and diluted that it melts away in the nothingness of slumber."—Macnab, *Philosophy of Sleep*, p. 21. The amount of sleep required by man is affected by so

many conditions (among which must be especially mentioned *age, temperament, habits,* and previous exhaustion), that no general rule can be laid down on the subject. The condition of the *fetus* may be regarded as one of continuous slumber: on its first entrance into the world, the infant passes most of its time in sleep, and this is particularly the case in children prematurely born, such children seeming only to awake for the purpose of receiving food. During the whole period of growth, in which it is necessary that the *constructive* operations of the body should preponderate over the *destructive* processes, an excess of sleep is required; and by the time that adult age has been attained, and the constructive and destructive processes balance each other, the necessary amount of sleep has gradually fallen to about one-third or less of the diurnal cycle. In very old age, again, in consequence of the deficient energy of the nutritive process, a larger amount of sleep is required. With regard to the influence of temperature, it is observed that a plethoric habit of body usually predisposes to sleep, while thin wiry people of a nervous temperament require comparatively little sleep. Persons of lymphatic temperament are usually great sleepers, but this is probably due, as Dr. Carpenter suggests, to the fact, that "through the dullness of their perceptions they are less easily kept awake by sensorial or mental excitement" than persons of a happier temperament. The influence of habit is by no means inconsiderable on the amount of sleep required by individuals, and this influence may be brought to act on the protraction as well as the abbreviation of the usual period: as extreme examples, we may mention that Gen. Elliott, celebrated for his defense of Gibraltar, did not sleep more than four hours out of the twenty-four (which is probably the smallest allowance for rest compatible with a life of vigorous exertion); while Dr. Reid the metaphysician, could take as much food, and afterward as much sleep, as were sufficient for two days. Moreover, the influence of habit in producing an aptitude for repose, or a readiness to wake at particular periods, is well known. The sleep of soldiers during a siege, of sailors or others who must take their rest as they best can, will often come on at command; nothing more being necessary to induce it than to assume a recumbent, or, at all events, an easy position, and to close the eyes. Thus Capt. Barclay, in his celebrated match, in which he walked 1000 m. in 1000 successive hours, very soon got into the habit of falling asleep the moment he lay down.

The condition of the great nervous centers during sleep is a subject of much interest, on which considerable light has recently been thrown by the observations of Mr. Durham. These observations were made on a dog from which a portion of bone about as large as a shilling was removed from the parietal region of the skull, and the subjacent *dura mater* cut away so as to expose the brain; and Mr. Durham draws the following conclusions from them: 1. Pressure of distended veins upon the brain is not, as is generally believed, the cause of sleep, for during sleep the veins are *not* distended. 2. During sleep, the brain is in a comparatively bloodless condition; and the blood in the encephalic vessels is not only diminished in quantity, but moves with diminished rapidity; and this is corroborated by the observations of Dr. J. Hughlings Jackson on the ophthalmoscopic condition of the retina during sleep, the optic disk being then whiter, the arteries smaller, and the retina generally more anemic than in the waking state. 3. The condition of the cerebral circulation during sleep is, from physical causes, that which is most favorable to the nutrition of the brain-tissue.*

This article would be imperfect without a brief reference to the conditions in which there is either an excess or a deficiency of sleep. There are numerous instances on record in which sleep has been continuously prolonged for weeks, or even months. Dr. Carpenter refers to two such cases, namely, those of Samuel Chilton (*Phil. Trans.* 1694) and Mary Lyall (*Trans. Roy. Soc. Edin.* 1818). Blanchet, a French physician, has recently recorded three cases of what he terms "constitutional lethargic slumber" in the *Comptes Rendus*, 1864. In one of these cases, the patient, a lady aged 24 years, who had slept for 40 days when she was 18 years of age, and 50 days when she was 20, at length had a sleep of nearly a year, viz., from Easter Sunday, 1862, to March, 1863. During this period, a false front tooth was removed in order to feed her with milk and soup, her only food. She was motionless and insensible. The pulse was low, the breathing scarcely perceptible, there were no evacuations, and she showed no signs of leanness, her complexion remaining florid and healthy. In such cases as these, it is not a prolongation of healthy natural sleep that is present, but a condition of hysteric coma.

Again, there are certain states of the nervous system in which there is either an entire absence of sleep (and this may continue for many days, or even weeks) or incomplete sleeplessness. Complete sleeplessness is often a most important symptom of disease. It frequently accompanies certain forms of continued fever, inflammatory affections of the brain, the eruptive fevers, etc., and when it continues for many days and nights, delirium, followed by stupor, is very apt to supervene. When the wakefulness is unattended by any disorder sufficient to account for it, some serious disease of the brain is most probably impending, such as palsy, apoplexy, or insanity. Incomplete or partial sleeplessness is a symptom of far less grave import. It is of frequent occurrence in persons whose minds are much engaged, or whose occupations subject them to great mental exertion or to the vicissitudes of fortune. It is, moreover, a symptom of many

*See Dr. Crippie's theory as to the balance of the distribution of blood within the cranium, in the *Causation of Sleep* (1883).

chronic diseases, as gout, chronic rheumatism, skin-diseases, disorders of the urinary organs, dyspepsia, hysterica, etc. It may also be excited by certain beverages and articles of diet; thus green tea and strong coffee often occasion wakefulness, and a full meal of animal food late in the day often disturbs the sleep of persons accustomed to dine at an earlier hour.

In the treatment of sleeplessness, or *insomnia*, as it is usually termed by medical writers, the first indication is to remove the cause, which occasions it, and "more particularly to correct a close or contaminated air; to reduce the temperature of the apartment when it is high, and the quantity and warmth of the bedclothes: to remove all the excitants to the senses; to abstract the mind from all exciting, harassing, or engaging thoughts; and to remove or counteract the morbid conditions of which this is a symptom or prominent consequence."—Copland's *Dictionary of Medicine*, art. "Sleep and Sleeplessness." A careful regulation of the secretions, by the due use of purgatives and alteratives, will often remove this symptom; and recourse should not be had to anodynes and narcotics until morbid secretions and fecal accumulations have been completely got rid of. But these medicines are of great service when the system is thus prepared for their reception. The choice of the individual drug or combination of drugs must be dependent upon the peculiarities of the case, but, as a general rule, there is no more serviceable narcotic mixture for an adult than 25 or 30 minims of the solution of hydrochlorate of morphia (of the regular Pharmacopeia), and 10 minims of chloric ether, taken in half a wine-glassful of water; medicines of this class should, however, never be resorted to without the advice of a physician. See HYPNOTICS.

SLEEP OF PLANTS, one of the phenomena of irritability (q. v.) in plants. Light acts on plants as a powerful stimulus, essential to their active and healthful vegetation. When it is withdrawn the flowers of many plants close, and the greater number show a tendency to it, while leaves more or less decidedly incline to fold themselves up. The leaf-stalk also generally hangs down more or less, although in some plants it is more erect during sleep. The sleep of plants, however, is not always nocturnal. The flowers of some open and close at particular hours of the day. Thus the crocus is a morning flower, and closes soon after midday; while some flowers expand only in the evening or during the night. Their hours of vegetative rest are probably as essential to the health of plants as those of sleep are to animals. It was Linnæus who first observed the sleep of plants, in watching the progress of some plants of *lotus*, the seeds of which he had sown.

SLEEPERS, timbers laid *asleep* or resting along their whole length. They are chiefly used along the top of dwarf-walls for the support of the timbers of the ground floor of houses.—The timbers supporting railway rails, and laid at right angles to them across the railway, are also called sleepers.

SLEIDAN, or **SLEIDANUS**, JOHANN, original name Philipsohn, 1506–56; b. Sleida, near Cologne; studied law at Liege, Paris, and Orleans, but gave himself to classical literature. He became a Lutheran, resided in Strasburg, was made by the council of the town professor of law, and by the Protestant princes of the Smalkaldic league their historian, and sent in 1545 on an embassy to France and England. His chief work is *De Statu Religionis et Reipublica Carolo Quinto Cæsare Commentarii* (1553–6).

SLEIGHT OF HAND. See LEGERDEMAIN.

SLEMMER, ADAM J., 1828–68; b. Penn.; graduated at West Point in 1850; in the army was promoted for gallantry in the Seminole war; assistant professor of ethics and mathematics at West Point, 1855–59. At the outbreak of the civil war he was in command of a small garrison at Fort McRea; took possession of Fort Pickens, Jan. 10, 1861, which he held until relieved by Col. Brown; brig. gen. of volunteers, 1862; fought at the siege of Corinth; severely wounded at the battle of Stone river, 1862, and disabled from further service; brevetted brig. gen. for gallantry, 1865.

SLES'WICK, a duchy known till the 14th c. as South Jutland, formed part of the Danish dominions till 1864, when it fell into the hands of the Austrian and Prussian sovereigns. In terms of the treaty of 1867 it was incorporated with Prussia. The pop. in 1864 was 406,486. Within its old recognized limits it was bounded on the n. by Jutland, on the e. by the Little Belt and the Baltic, on the w. by the German ocean, and on the s. by Holstein, from which it was divided by the Eyder and the Kiel canal. The area was 3,492 sq. miles. The country consists in its eastern and central parts of a gently undulating plain, deeply indented with fiords and streams.

The numerous islands which skirt the w. coast of Sleswick have probably, at some not very remote period, formed part of the mainland, for navigation is so seriously impeded by the sand-banks, that this coast is now accessible for ships by only three passages. The cluster of small islands known as the Halligers, which lie, unprotected by dams, in the midst of these submerged sand-tracts, are so constantly exposed to the action of waves and storms, that the inhabitants are compelled to raise their houses on piles. On the eastern coast of Sleswick lie the islands of Alsen, Aroe, and Femern, where the principal bays and inlets are the Haderslev and Aabenrade fiords, opening into the Little Belt; the Flensborg fiord, the Slie, the Eckerndorfe fiord, and the

Kieler fiord, which formed the ancient boundary between Sleswick and Holstein on the s.e., while the Eyder completed it on the s.w. The principal branches of industry are agriculture, the rearing of cattle, fishing, and ship-building. The Slie is the chief seat of the herring and salmon fisheries, which, although still of some importance, are very inferior to those of the middle ages, when, according to the Danish historian, Saxo Grammaticus, herrings were so plentiful in the Belts and Cattegat, that they could be caught with the bare hands. The chief towns of Sleswick are Flensburg (q.v.), Sleswick, now capital of a Prussian province, a very ancient city, and formerly the key of Denmark (pop. '90, 15,123); Haderslev, Husum, and Tonder. In the s., and partly in Holstein, Rendsborg (pop. '90, 13,195). With regard to the language spoken by the mixed population of the duchy, it may be asserted that rather more than the half speak Danish; and of the remainder, about 30,000 persons who belong to the islands on the western coast, which once formed part of the old province of North Friesland, still use the Frisic language, the rest of the inhabitants using either low or high German. The original Danish element of Sleswick has remained purest in the northern half of the duchy; while in the southern parts, where the inhabitants are naturally brought much in contact with Holstein, they have of late years adopted the views, tastes, and language of their German neighbors. The Lutheran is the established religion of Sleswick.

In accordance with the conditions stipulated in the treaty of Vienna, Aug., 1864, by which the duchies of Holstein and Sleswick were ceded to Austria and Prussia, the island of Aroe and other districts of Sleswick, measuring about 115 sq.m., were to be reunited to Denmark; while the latter power was to give in exchange a territory of about 130 sq.m., which, although situated within the boundary of Sleswick, had hitherto been under the jurisdiction of Jutland.

Sleswick, which forms part of the ancient Cimbrian peninsula, has from the earliest period been a debatable land between Danes and Germans; and according to the authorities of the latter, it was anciently included in the marches of the empire, having been incorporated by Henry the Fowler in 930, and reorganized by Otho I., when in 948 the latter erected bishops' sees in Aarhus, Ribe, and Sleswick. In 1027 the Danish king Knud (our Canute) obtained from Conrad II. the recognition of the independence of Sleswick, which was declared to belong unconditionally to Denmark, and thenceforth given as a Danish fief of the crown to the younger sons of the royal house. In 1232, king Valdemar Seir, whose father, prince Knud Laward, had ruled ably over the duchy, gave Sleswick—which was then, and for some time later, known as South Jutland—to his younger son Abel. The exact terms of the donation became a subject of dispute, during the successive reigns of Valdemar's sons, Eric, Abel, and Christopher, and began the long course of civil wars and family feuds which are associated with this much-contested territory. Abel, and his sons after him, backed by their kinsmen, the counts of Holstein, maintained that Valdemar had given the duchy as an hereditary, inalienable, and indivisible fief; while, on the part of the Danish crown, it was contested that South Jutland was merely a *precarious* fief, which might be recalled at the pleasure of the sovereign. Its vicinity to Holstein tended to keep up the feuds, to which the vexed question of its mode of tenure had given occasion, and which, in fact, only ceased when the resources of the conflicting parties were exhausted, although the bitterness and ill-will with which they were fed seemed to know no intermission. The following brief summary gives the skeleton of the leading events of the history of Sleswick from the dawn of its troubles till the final outbreak in 1848, when, by the influence of the neighboring Holstein nobles, the Germanized great landed proprietors of Sleswick entered upon the course of armed opposition to the mother-country, which has culminated at the present moment in the forcible separation from the Danish crown of the duchy of Sleswick, and its imminent incorporation in the Prussian monarchy. In 1386, queen Margaret (q.v.) gave Sleswick in fief to Gerhard, duke of Holstein; and on the extinction of his male heirs in 1459, it virtually lapsed to the crown, with which it was united in 1460 under the rule of Christian I. (the founder of the Oldenburg line), by a mode disastrous to the integrity of the Danish monarchy. See DENMARK. After frequent division among the younger members of the royal house, which gave rise to a great number of collateral lines of the Oldenburg family (of which the Glucksburg-Sonderborg and the Augustenburg are, with the exception of the imperial house of Russia and the ducal house of Oldenburg, the chief representatives), the ducal portions of Sleswick were inalienably incorporated with the crown of Denmark under king Frederick IV. in 1721. This act, which had the guaranty of the great powers, had resulted directly from the treasonable attitude maintained in the previous wars with Sweden by the Holstein-Gottorp princes of Sleswick, and was ratified by Russia and Sweden, no less than by England and France. The different orders of the duchy took the oaths of allegiance for themselves and their heirs, the Sleswick arms were quartered with those of Denmark proper, and the duchy was included with the latter in one common mode of administration. In 1848, the revolutionary movement of continental Europe fanned the flame of discontent in the duchies into a blaze, and the upper classes of Sleswick, who had in the course of time become strongly imbued with the German tendencies of the Holstein nobles, with whom they fraternized, joined the latter in open armed rebellion under the

chief leadership of the princes of Augustenburg. The Germanized Sleswick nobles, influenced by the principles of hatred to Denmark, which had long been gathering strength in the university of Kiel, refused to admit the difference between their relations to the crown and those of the Holsteiners, with whom they demanded to be indissolubly associated in separate legislative and executive chambers. The king refused to separate Sleswick from the monarchy; the irritation increased on both sides; the royal troops appeared in the duchies to restore order; the Sleswick-Holstein army, whose ranks were principally filled by German volunteers, took the field, aided by the confederate forces sent by the diet to co-operate with the Holsteiners. The troubles by which the German states were threatened at home led, after a few indecisive engagements had been fought, to the withdrawal of the confederate armies, and Prussia having made a special treaty of peace (after a preliminary truce with Denmark), the duchies were left to themselves, and the royal authority re-established, on the understanding that the king should submit a new form of constitution for Holstein and Sleswick to the diet, on account of the former being a member of the confederation; Sleswick being in the meanwhile put under a provisional government of Danish, Prussian, and English commissioners. By the peace with Prussia, it was solemnly guaranteed that all old treaties, including that of 1721, should be maintained in regard to Denmark; and in 1851, Austria threw an army into the duchies to aid Denmark in supporting her authority, and in dissolving the joint Sleswick and Holstein assembly. On the death of Frederick VII. in 1863, prince Christian of Glücksburg (see DENMARK), having ascended the throne as Christian IX., king of Denmark, prince Frederick of Augustenburg called upon the Sleswick-Holstein authorities to refuse the oath of allegiance to the new king, and to acknowledge himself as the rightful duke of Sleswick-Holstein, basing his claims on his descent from the legitimate and elder male line of the house of Oldenburg. This appeal was responded to by 25 members of the Holstein diet, who, on behalf of their own duchy and of Sleswick, petitioned the German diet to recognize the validity of the claims of the Augustenburg line, and to pronounce the London protocol of the act of succession devoid of force. The prince, by this step, set at nought the family compact by which his father, uncle, and himself, for themselves and their heirs, had, at the close of the war of 1848, accepted a sum of money as full indemnity for all claims on the Danish territories, and been allowed on that condition to evade all further consequences of the open rebellion in which they had stood against the throne. In the meanwhile, the fundamental law of Nov., 1863, for the kingdom of Denmark and the duchy of Sleswick, which had passed the rigsråd, and received the late king's signature shortly before his death, was published, together with a manifesto of Christian IX., stating his intention in regard to Holstein and Lauenburg. The diet, without committing itself to uphold the Augustenburg claims, put a confederate execution into Holstein; the Danish troops were withdrawn into Sleswick; and on Jan. 6, 1864, the Holstein towns did homage to the duke; while a federal commission suppressed the provisional Holstein government, which had exercised its powers since 1862, and established a ducal government at Kiel. The Austrians and Prussians, professing to act for the diet, summoned the Danish king to withdraw the constitution of November within 48 hours; in reply to which the Danish government demanded a term of six weeks to convoke the rigsråd, without whose sanction no constitutional change could be adopted. The demand was rejected, and the Austro-Prussian army entered Holstein, and hostilities commenced. For ten weeks the Danes made a gallant stand against their enemy, whose enormous superiority in strength of numbers, and in the efficiency of their artillery and small-arms, made their final victory the inevitable rather than the glorious result of the campaign. The Danes were compelled to suspend hostilities, and to submit to the terms dictated by their conquerors. A conference was held at Vienna, and, after protracted negotiations, Denmark was constrained to accept peace (Aug., 1864), on the hard terms of ceding to Austria and Prussia, Holstein, Sleswick, and Lauenburg, on the ground that the indivisibility of the two duchies must be firmly established for the German fatherland by these two great powers. Following upon this, duke Frederick of Augustenburg was in turn the favored and the rejected candidate for the throne of the new state of Sleswick-Holstein. The upper classes in small numbers in Sleswick, in Holstein almost unanimously, were in favor of his claims, while the burgher and lower classes of Sleswick appeared equally unanimous in regretting their severance from Denmark; and the decidedly expressed wishes of the Holstein party, backed by the lesser German states, to have the duke as their sovereign, the protests and counter-protests of the diet and of foreign powers, all resulted in an announcement by Austria and Prussia that according to the evidence of the commission appointed to examine the merits of the various claims of Denmark, Augustenburg, and Oldenburg to the duchies, Christian IX. was by right of succession the undoubted possessor, and that from him the duchies had passed by right of victory to Austria and Prussia. Prussia sought to annex these duchies to her dominions, and offered Austria pecuniary compensation for her assistance in the war. On the other hand, Austria advocated the independence of the duchies. Neither country would yield, and the dispute ultimately resulted in the war of 1866. According to a treaty concluded in 1867, Austria abandoned her claims in favor of Prussia, but stipulated that a part of Sleswick should be restored to Denmark. This stipulation, however, has never been given effect

to. See GERMANY. The Prussian province of Sleswick-Holstein, formed out of the duchies of Sleswick and Holstein, has an area of 7299 sq. m. and a pop. of (1885) 1,150,306; (1890) 1,217,393; (1895) 1,286,416 (including Heligoland).

SLICKENSIDES are the smooth and polished, and generally glazed, surfaces of flaws in rocks. They are considered to have been produced by the friction of the two surfaces during some movement of the rock. But the two surfaces of the flaw are almost always so uneven that it is impossible to conceive that they could have rubbed against each other; besides, the flaws are generally very small, and the true slickenside is always confined to a single stratum, never passing into the bed above or below. We believe they are the castings of liquids or gases confined in the bed, and subjected to great pressure, and are similar in origin to the glazed cavities produced by gases in slags, or, to use a very familiar illustration, by the compressed steam in breakfast rolls.

SLIDE, a piece of mechanism applied to instruments of the trumpet and trombone family, for lengthening and shortening the sounding tube. By its means the gaps are filled in between the fundamental note and its succeeding harmonies. The slide was known at an early date. In the G bass trombone the length of a man's arm is not sufficient to reach the lower slide positions and a jointed handle fixed to the cross-bar of the slide aids in the mechanism of the instrument. See *Trombone*. The word slide is also applied to an ornament in both vocal and instrumental music. The English name slide is almost obsolete, but it signifies a group of three notes, either ascending or descending, which contain one note to be accented and two grace notes.

SLIDELL, JOHN, 1793-1871; b. N. Y.; educated at Columbia college. Settling in New Orleans he became distinguished at the bar; was a member of Congress, 1843-45, when he was appointed minister to Mexico; was elected to the U. S. senate for a partial term in 1853, and afterward re-elected. He left the senate on the passage by Louisiana of the act of secession in 1861; the same year was appointed commissioner to France, ran the blockade to Havana, from which, with Mason, commissioner to England, he sailed on the British mail steamer *Trent*, which was boarded, Nov. 8, by capt. Wilkes, of the U. S. steamer *San Jacinto*, who arrested both the commissioners. They were confined in fort Warren, Boston, but released on the demand of the British government, and sailed for England. Slidell succeeded in obtaining some help for the confederates in Paris. He settled in London at the end of the war.

SLIDING RULE, an instrument invented by the Rev. William Oughtred, an English divine and mathematician, for the purpose of solving arithmetical problems mechanically, consists of three pieces of wood, of which two are fastened together by slips of brass at a sufficient distance from each other to permit of a third sliding between them. The size of instrument which best combines convenience with accuracy is one about 2 ft. long, 2 in. broad, and $\frac{1}{4}$ in. thick. One side of the rule has the following scales marked on it in order: a line of tenths of in., of equal parts divided into tenths and hundredths of ft.; three lines of numbers, each line consisting of the numbers from 1 to 10 twice repeated; a line of sine rhumbs (logarithmic sines of each quarter-point of the compass); a line of meridional parts; and a line of equal parts. Of these, two of the lines of numbers are on the middle piece or *slider*. On the other side are—two lines of *natural scales*, including sines, secants, tangents, equal parts, etc.; two lines of logarithmic sines, two lines of logarithmic tangents, a third line of logarithmic sines, and a line of versed sines. Of these, one line of logarithmic sines and one of tangents are upon the slider. The scale in most common use is that of numbers, and a description of the way in which it is used will give a key to the whole working of the instrument. It is necessary, however, to notice as a preliminary, that the scale of numbers is not evenly divided, as in this case only addition and subtraction could be performed, but is divided in proportion, not to the numbers, but to their logarithms, so that 3, whose logarithm is very nearly the half of that of 10, stands almost half-way between 1 and 10; and similarly of the other numbers. All questions of numerical proportion can thus be easily worked by means of the line of numbers on the slider, and the adjacent and corresponding one on the fixed part of the rule. To find a fourth proportional to three given numbers, we place the first term (on the slider) opposite to the second term (on the fixed scale), and opposite the third term (on the slider) is the fourth or number required (on the scale). Multiplication is performed by making 1 the first term of a proportion, and division by making it the second or third. The other scales marked on the rule are useful in the solution of trigonometrical, geographical, and nautical problems, and the results obtained are much more accurate than one at first sight would believe. Sliding rules of circular form have been made by the French, but they are not in any way preferable to the ordinary straight form.

SLIDING SCALE, a provision in some of the English restrictions formerly in force on the trade in corn, by which, in order to encourage importation: when prices were high, and discourage it when low, the import duty was diminished as the price rose, and at famine-prices grain came in duty free. By the act of 1828 wheat was allowed to be imported on payment of a duty of £1 4s. 8d. when the average price over England was 62s. a quarter. For every shilling less of price, a shilling was added to the duty; and for a rise of price, the duty decreased. In 1842, while the agitation regarding the corn-laws was going on

sir Robert Peel introduced and carried a modification of the sliding scale which, however, did not succeed in mitigating the popular hostility to the corn-laws. By the sliding-scale act of 1842, the duty per quarter was fixed at £1 when the price of corn was under 51s., and diminished as the price increased, till on the quarter of wheat attaining the price of 73s. it fell to 1s. See CORN LAWS.

SLIGO, a maritime co. of the province of Connaught, Ireland, bounded on the n. by the Atlantic and the bay of Donegal, s. by Roscommon and Mayo, e. by Roscommon and Leitrim, and w. by Mayo. It is 41 m. from e. to w., and 38 from n. to s.; the total area is 452,000 acres, of which about 79,000 are under tillage, and the remainder uncultivated. The pop. in 1861 was 124,845; in 1891, 98,013, of whom 89,191 were Roman Catholics. The coast-line is indented with numerous bays, and except in the bay of Sligo, dangerous for navigation. The surface rises gradually from the coast eastward as far as an elevated range called Slieve Gamp and the Ox mountains, the highest point of which rises to 1800 feet. Sligo contains comparatively few and unimportant lakes, but some of these, however, are extremely picturesque, especially lough Arrow and lough Gill. Only three of its streams are navigable—the Moy, the Owenmore, and the Garroogue, and they are all inconsiderable. The county is traversed by a railway, which is a branch of the Midland Great Western, and connects the county town of Sligo (q.v.) with Dublin. The mineral products of the county, although not very rich, are various, and consist of copper, lead, iron, and manganese. The climate is variable, and although rain is frequent, it is, on the whole, mild and healthy. The soil in the n. is mossy and sandy, both being occasionally intermixed, and at times alternating with a gravelly loam. The plain of Sligo is a deep rich loam; and in the southern portion of the county are found large tracts of corn-land and pasturage. The occupations of the people are mainly agricultural, and until some years back, they were engaged chiefly in tillage; but the land is now used chiefly for pasturage. The sea and salmon fisheries are important, and there are manufactures of woollens, linens, and leather.

Sligo was anciently the seat of the O'Connors, and was the scene of many conflicts between the several branches of that family. The domestic feuds of the O'Connors were among the causes which facilitated the first inroads of the Anglo-Normans. The district contains many remains both of the Celtic and of the Anglo-Norman period. Of the former, there is one very interesting called the Giant's Cairn, near Sligo; and there are many raths, cromlechs, and ancient caverns. The county of Sligo sends two members to the imperial parliament.

SLIGO, chief t. of the co. of the same name, situated on the river Garroogue; distant from Dublin, with which it is connected by a branch from the Midland Great Western railway, 131 m. n.w. Pop. '61, 13,361; '91, 10,274, being a decrease in 30 years of 3,087. Sligo had its origin in the erection of a Dominican abbey in the 13th c. by Maurice Fitzgerald, earl of Kildare, around which—and a castle also built by him—a town was gradually formed. In the reign of James I. it received a charter. The modern town stands within a bend of the river, chiefly on the left bank. It is for the most part well built, and contains several handsome public edifices. It possesses few important manufactures, but is a place of considerable commerce, which is directed with judgment and energy by a body of town and harbor commissioners. The exports are chiefly of cattle, corn, flour, meal, butter, provisions, and yarn. There are a town hall, a Roman Catholic cathedral, and the ruins of an old abbey. Steamers ply regularly between Sligo and Glasgow, Liverpool, and Londonderry. Sligo formerly returned a member to parliament, but was disfranchised in 1870.

SLING, a weapon much in use before the introduction of firearms, consisted of a piece of leather, with a round hole in the middle, and two cords of about a yard in length. A round pebble being hung in the leather by the cords, the latter were held firmly in the right hand, and swung rapidly round. When the stone had attained great speed, one string was disengaged, on which the stone flew off at a tangent, its initial velocity being the same as it had at the last moment of revolution. This velocity gives far greater range and force than could be imparted in mere throwing.

SLIP, in a dockyard, is a smooth, inclined plane, sloping down to the water, on which a ship is built. It requires to have a very solid foundation. Among modern inventions is a slip on which a sort of truck runs on numerous rails. This truck is run under a ship as she floats; the water is diminished till she rests on it, and it is then hauled up the slip by steam power until she is high and dry. Such a slip takes the place of a dry dock. See also LAUNCH and SHIP-BUILDING.

SLIPPED, in heraldry, a term of blazon applied to a leaf, branch, or flower, which is represented with a stalk, and torn from the parent stem.

SLOAN, SAMUEL, b. Ireland, 1817; brought to New York, 1819; received a common school education; after holding office in King's co., N. Y., was elected president of Hudson River railroad company, 1855; and president of the Delaware, Lackawanna, and Western railroad company, 1867; which last office he still holds. He is also president of railroads in Michigan and Texas.

SLOANE, Sir HANS, an eminent physician and naturalist, of Scotch parentage, his father having been the chief of the Scottish colony which was settled in Ulster by

James I. of Great Britain, was born at Killyleagh, in county Down, Ireland, April 16, 1660. He devoted himself during his boyhood to natural history and medicine, and in spite of an attack of hæmoptysis, which lasted from his 16th till his 19th year, he arrived in London in 1679, with an excellent knowledge of the first of these sciences, and a fair acquaintance with the second. His apprenticeship to Stafforth, a pupil of Stahl (q.v.), and the acquaintance, subsequently ripened into close friendship, which he formed with Boyle and Ray, two of the most celebrated naturalists of their time, did much to encourage and advance him in his favorite studies. During a brief sojourn in France he attended the lectures of Tournefort and Du Verney, obtained on his return, by the active support of Sydenham (q.v.), a footing in London as a physician, and was elected a member of the royal society in 1685, and of the royal college of physicians in 1687; but in September of the latter year, he accompanied Monk, duke of Albemarle, to Jamaica, and investigated the botany of that and the adjoining islands with such zeal and diligence during the 15 months of his stay, that his herbarium numbered 800 species. Resuming his professional practice on his return, he became physician to Christ's hospital (1694-1724), president of the college of physicians (1719-1735), secretary to the royal society (1693), foreign associate of the French academy of sciences (1708), and succeeded sir Isaac Newton as president of the royal society in 1727. He had been created a baronet and physician-general to the army in 1716; and in 1727 received the further honor of being appointed royal physician. Though of remarkably delicate constitution he lived to the great age of 92, dying at Chelsea, Jan. 11, 1753. The chief point to be remarked in Sloane's moral character was his benevolence, as shown in the charitable uses to which he applied the whole of his salary as physician of Christ's hospital, in his zealous promotion of the various schemes for affording medicine and attendance gratuitously to the poor, and his support of the foundling hospital, of which he was one of the founders. By long-continued perseverance he succeeded in forming a most extensive museum of natural history, a library of 50,000 volumes, and 3,560 MSS., which he directed to be offered at his death to the nation for £20,000 (about one-fourth of its real value), and which formed the commencement of the British Museum (q.v.). He also contributed numerous memoirs to the *Philosophical Transactions*, whose publication he superintended for a number of years. But his great work was the *Natural History of Jamaica* (fol. 1707-1725), containing also an excellent account of the topography, meteorology, and population of the island, which book was the means of introducing into the pharmacopœia a number of excellent drugs, hitherto unknown.

SLOAT, JOHN DRAKE, 1780-1867; b. New York city; entered the navy as sailing-master, 1800; was in the engagement between the *United States* and the *Macedonian*, 1812. He participated in the expedition against the West Indian pirates, 1824-25; commanded the Pacific squadron, 1846-52; was commandant at the Norfolk navy yard, and superintended the building of Stevens's battery at Hoboken; retired with the rank of commodore, 1862; rear-admiral, 1866.

SLOCUM, HENRY WARNER, b. N. Y., 1827; graduated at West Point, 1852; was lieut. in various military services, 1852-56; became a lawyer at Syracuse, and was in the state legislature, 1859; appointed col. of the 27th N. Y. regiment, which he led at Bull Run where he was severely wounded; made brig. gen. of volunteers, and after his recovery commanded a brigade in Franklin's division of the Army of the Potomac in campaign of 1862; was at the siege of Yorktown; commander of the division on Franklin's transfer to the 6th corps; at the battle of Gaines's Mill rendered important service; at Glendale and Malvern Hill held the right of the main line; maj.-gen. of volunteers July 4th, and engaged at second battle of Bull Run, South Mountain, and Antietam; in October made commander of 12th corps, which he led at Chancellorsville and Gettysburg, in command of the right wing of the army; April, 1864, was placed in command of the district of Vicksburg; in August succeeded Gen. Hooker in command of 20th corps; in Sherman's march to the sea, commanded the left wing of the army—participating in all the engagements to the surrender of Johnston. After the war Gen. Slocum was a member of the 41st and 42d Congress. He died April 14th, 1894.

SLOBODSK', or SLOBODSKOY', a t. of Russia, in the government of Viatka, is situated on the river Viatka, about 20 m. n.e. of the town of the same name. Pop. '93, 7739.

SLOE, or SLOE-THORN, *Prunus spinosa*, a shrub of the same genus with the plum, and perhaps really of the same species with it and the bullace. It is generally a shrub of 4 to 10 ft. high, sometimes becoming a small tree of 15 to 20 feet. It is much branched, and the branches terminate in spines. The youngest shoots are covered with a fine down. The flowers are small, snow-white, and generally appear before the leaves. The fruit is ovate, or almost globose, pale blue with blackish bloom, and generally about the size of the largest peas. The sloe is abundant in thickets and borders of woods, and in arid places in Britain and almost all parts of Europe. The shoots make beautiful walking-sticks. Although spiny, the sloe is not suitable for hedges, as its roots spread, and it encroaches on the fields. The bark is bitter, astringent, and tonic. The flowers, with the calyx, are purgative, and are in some places much used as a domestic medicine. The leaves are used for adulterating tea. The unripe fruit dyes black. The fruit is very austere. It is much used on the continent of Europe for making a preserve, also in some places for making a kind of brandy. An astringent extract, called *German acacia*,

is prepared from it, which was once much employed in cases of diarrhœa and mucous and bloody discharges. The juice is much used to impart roughness to port wine, and in the fabrication of spurious port. See illus., BOTANY, vol. II.

SLO-NIM, a t. of European Russia, in the government of Grodno, and 105 m. s.e. of the town of that name. It has some trade and large manufactures of cloth. Pop. '94, 25,646.

SLOOP is a one-masted cutter-rigged vessel, differing from a cutter, according to old authorities, in having a fixed bowsprit and somewhat smaller sails in proportion to the hull. The terms "sloop" and "cutter" appear, however, to be used nearly indiscriminately. In the American navy, a sloop-of-war is a vessel, of whatever rig, between a corvette and a gun-boat, and ordinarily constituting the command of a commander. In the days of the sailing navy, sloops-of-war carried from 10 to 18 guns.

SLOT. (Scotch *sleuth*.) A deer's trail or track. "As a blood-hound follows the *slot* of a hurt deer." In Mechanics, a depression or mortise cut in a metal plate, or a slit through it, for the purpose of receiving some part of a machine either fixed or movable.

SLOTH, *Bradypus*, a genus of mammalia, of the order *edentata*, and family *tardigrada*. The name was given from observation of the very slow and awkward movements of the animals of this genus on the ground; but a better acquaintance with their habits, and observation of their movements among the branches of trees, for which their conformation peculiarly adapts them, have shown it to be by no means appropriate or descriptive. In like manner, Buffon's notion that they are creatures of imperfect organization, and doomed to a miserable existence, has been completely exploded. Their structure, like that of every other creature, is admirably adapted to their mode of life. They feed on the leaves, buds, and young shoots of trees, among the branches of which they are born and spend their whole life, rarely and unwillingly descending to the ground. They do not walk upon the branches, but cling beneath them, with the back downward. The fore-legs are much longer than the hinder ones, and are used for embracing a branch, or for drawing in the branches on the foliage of which they are to feed, and both the fore and hind feet are furnished with very long, curved, and sharp claws. The pelvis is very wide; and the hind-legs, thus widely separated, also diverge from one another. The structure of the wrist and ankle-joints is such that the palm or sole is turned toward the body, so that upon the ground, the animal is compelled to rest on the side of the hind-foot, while the length of the fore-legs causes it to rest on the knee or elbow of them, struggling forward by a shuffling movement, and dragging itself along by stretching out the fore-legs alternately and hooking the claws into the ground, or grasping some object. But in a dense tropical forest, sloths generally find it easy to pass from the branches of one tree to those of another, often taking advantage for this purpose of a time when branches are brought within their reach by the wind. Where the trees are more distant from each other, they will eat up the whole foliage of a tree ere they descend from it. The hair of sloths is coarse and shaggy, of a very peculiar texture, inelastic, and much like grass withered in the sun, but affords an excellent protection from insects, while it also gives them such an appearance that they are not readily observed except when in motion. The muzzle of sloths is short, and the tail is short. There are no incisor teeth, but sharp canine teeth, and eight molars in the upper, six in the lower jaw. The molars are cylindrical, penetrated by no laminae of enamel, and adapted merely for crushing, not for grinding, the food. For this, however, there is compensation in the stomach, which is somewhat imperfectly divided, by transverse ligatures, into four compartments, for the longer retention and more thorough digestion of the food, although there is no rumination. The female sloth produces only one young one at a birth, which clings to its mother till it becomes able to provide for itself. The voice of sloths is a low plaintive cry. Their chief enemies are large snakes, but against these they defend themselves by their powerful fore-legs and claws. A sloth has been known to grasp a dog round the neck and strangle it. There are very few species. One species has the fore-feet furnished with only two toes: the others have three. These, with other differences, have been made the ground of a recent division of the genus into two. The **TWO-TOED SLOTH** or **UNAU** (*Bradypus* or *Cholepus didactylus*) is about two ft. in length, of a uniform grayish-brown color, often with a reddish tint. The best known species of **THREE-TOED SLOTH** is the **AI** (*Bradypus* or *Acheus tridactylus*), which is smaller than the Unau, has a more obtuse muzzle, and is generally brownish gray, slightly variegated with hairs of different tints, the head darker than the body. All the sloths belong to the tropical parts of America. See illus., MARSUPIALIA, vol. IX.

SLOT TING-MACHINE, a machine for cutting slots, or square grooves, in metal. It is of great importance in mechanical engineering, and many very ingenious inventions have been made for facilitating the process. The principle is, however, very simple, and is the same in all. It consists of a cutting tool, or chisel, held very firmly in an arm, which is pressed down and raised alternately. The tool is thus made to pare off a thin portion of the metal each time it descends, until it has cut a slot of sufficient size. Water is continually thrown on to prevent the metal from becoming overheated by the friction.

SLOUGH, a village of England, in the county of Buckingham 18 m. w. of London, by the Great Western railway. On the road between Slough and Windsor, which is distant about $2\frac{1}{2}$ m., lived sir William Herschel, and at the observatory which he erected here, in which was placed his great telescope, many of his important astronomical discoveries were made. Pop. '91, 5426.

SLOVAKS, THE, are the Slavic inhabitants of north Hungary, who in the 9th c. formed the nucleus of the great Moravian kingdom, but who, after the bloody battle of Presburg (907 A.D.), were gradually subjugated by the Magyars, to whom even yet they bear no friendly feeling. The Slovaks who are of a soft, pliant disposition, and industrious character, number about 1,900,000, and are mostly Catholics. The Slovaks whose character probably comes nearest to that of the old Slavic type, travel in great numbers over Germany and Poland as pedlars. Their language is a dialect of Bohemian. Among the most notable of the Slovak authors are the poets Holly and Kollar (q.v.); Matth. Bel (1684-1749); Stephan Leschka (1757-1818), editor of the first Slovak journal; Bernolak, author of a Slovak grammar; Palkovitsh (died 1835); and Tablitsch, who published four volumes of poetry (1806-12). A fine collection of popular Slovak ballads has been published by Kollar (2 vols., Ofen, 1834).

SLOVENTZI, or **VINDS**, a south Slavic race found in Hungary and other Austrian provinces, numbering 1,260,000 chiefly Roman Catholics of the Latin rite. They are sometimes confounded with the Wends, who are a distinct though remotely kindred people. The language, related to the Servian, is written in Roman characters, and at the rise of the reformation, was beginning to receive literary culture. There is some recent literature, chiefly religious.

SLOW-MATCH, a combustible material, such as cotton, hemp, tow, etc., often dipped in a solution of nitrate of potash (saltpeter), and formed into a thin rope. It is used for exploding gunpowder in various ways on account of its slow, steady way of burning, a sufficient length being taken to enable the operator to remove to a safe distance before the explosion. Slow-match was much used by artillerymen for firing of cannon, but it has been generally given way to friction fuses and percussion caps.

SLOYD (Swedish, *slöjd*). See **MANUAL TRAINING**.

SLUBBING. See **SPINNING**.

SLUG, *Limax*, a genus of gasteropodous mollusks, of the division *monœcia* (hermaphrodite), and of the family *limacidae*, which is closely allied to the snail family, *helicidae*, but has no external shell. There is, however, a rudimental shell, generally concealed within the mantle, placed over the respiratory cavity. The *limacidae* are diffused over the whole world. They commit great ravages among field and garden crops during moist weather. In frosts they become dormant, taking shelter under clods and at the roots of plants. They lay eggs in clusters in moist places, often at the roots of grass. The eggs resemble small oval bags of jelly. The body is generally oval or oblong, elongated. The foot is not distinct from the body. There are four retractile tentacles; the eyes are at the tips of the longer pair. Slugs often climb trees in quest of decaying vegetable matter on which to feed, and let themselves down by means of mucous threads, for the formation of which there is a small aperture at the hinder end of the body. Of British species, one of the most common is the **GRAY SLUG** (*limax agrestis*), which is of a whitish ash color; another is the **GREAT GRAY SLUG** (*L. maximus* or *antiquorum*), the largest British species; another is the **BLACK SLUG** (*L. ater*), often popularly called the black snail. The **RED SLUG** (*agrion agrestis*) is also very plentiful. Careful gardeners often gather slugs by the aid of a lantern at night, and destroy them. They may also be killed by watering the ground with a weak solution of ammonia.

SLUR, in music, an arch drawn over two or more notes *not* on the same degree, to indicate that these notes are to be played *legato*, or smoothly and fluently

In vocal music, a slur is placed over all the notes that are to be

sung to the same syllable, unless where they are grouped together by a common line. A slur must be distinguished from a *tie*, which is a similar arch drawn over two notes on the same degree, and denoting that instead of the two notes written, one is to be played of the length of both.

SLUTSK, a t. of European Russia, in the government of Minsk, about 60 m. s. of the town of that name, near the source of the lesser Slutch. Pop. '93, 18,041.

SMACK is a generic term for small decked or half-decked vessels employed in the coasting and fishing trade. The majority of smacks are, however, rigged as cutters, sloops, or yawls. According to Wedgewood the *m* in this word is a corruption of *n*; the Anglo-Saxon has *snakk*, a small vessel, and there is a corresponding form in the other Teutonic and Scandinavian tongues.

SMALCALD. See **SCHMALKALD**.

SMALL-ARMS, in the modern acceptation, consist of the weapons actually carried by a man. They have been described under their respective heads, **BAYONET**, **FIRE-ARMS**, **LANCE**, **SWORD**, **PISTOL**, etc.

SMALL-ARMS FACTORIES, **ROYAL**, are the establishments through which all the small arms of every description are supplied to the English army, the militia yeomanry, and volunteers. The headquarters are at Enfield, where there is a vast manufactory; and at Birmingham there is a considerable establishment for viewing the arms supplied by contractors. For many years there had been a small ordnance factory at Enfield lock, where a few thousand muskets were laboriously forged by hand each year; but when the sudden introduction of the rifle, and the demands of the Russian war, called for a supply of arms, which the trade of all Europe and America was unable to meet, government determined to erect machinery for the fabrication of arms. For this purpose the factory at Enfield was entirely remodeled; machinery of great power and delicacy was adopted; and now, when in full work the factory can turn out daily 1000 complete and proved rifles, besides a corresponding complement of other small-arms. At the same time the accuracy of workmanship is so great that a hundred rifles might be taken entirely to pieces, the several portions thrown promiscuously together, and a hundred complete rifles could be forthwith re-formed without any difficulty from the same pieces. Much of the merit of this great establishment was due to maj.gen. Manley Dixon of the royal artillery, who long superintended the factory after it was remodeled. The success of the factory has reduced in a remarkable degree the cost of rifles, and has brought down correspondingly the price charged by the trade for the large quantities still intrusted to it.

SMALLEY, **GEORGE WASHBURN**, an American journalist, born in Mass. in 1833; graduated at Yale university 1853, studied law at Harvard, and practiced in Boston; became war correspondent for the New York *Tribune* 1861, and an editor of that newspaper a year later. He went to the Austro-Prussian war, 1866, as correspondent for the *Tribune*; lived in London from 1867 as correspondent of the same paper until 1895, when he returned to the U. S. as correspondent of the London *Times*.

SMALL-POX, or **VARIOLA**, is one of the most formidable of the class of febrile diseases known as the *exanthemata* (q.v.). All cases of regular small-pox are divisible into three stages—viz.: (1), that of the initial or eruptive fever; (2), that of the progress and maturation of the specific eruption; and (3) that of the decline. Some writers make a primary stage of the period of incubation, or of the time intervening between the reception of the poison into the system, and the first appearance of febrile symptoms; but this is not entitled to be regarded as a stage of the disease, seeing that no symptoms of disorder have begun to show themselves. The *first stage* begins with rigors, followed by heat and dryness of the skin, a quickened pulse, furred tongue, loss of appetite, pain in the pit of the stomach, with nausea, vomiting, headache, and often pains in the back and limbs. The violence of the pains in the back, and the obstinacy of the vomiting, are frequently very well marked and characteristic symptoms. In children, the disease is often ushered in by convulsions; while delirium sometimes attends its outset in adults. On the third day, minute red specks begin to come out first on the face, then on the neck and wrists, and on the trunk of the body, and lastly, on the lower extremities. The fever usually begins to subside as soon as the eruption appears, and by the beginning of the fifth day, when the eruption is generally completed, the fever has entirely disappeared. The *second stage* commences when the eruption is fully out. Upon the second or third day of the eruption, a little clear lymph is seen in each pimple, which has increased considerably in size since its first appearance, and which is thus converted into a *vesicle*. The vesicles gradually increase in breadth, and become converted into *pustules*, which are at first depressed in the center, but by the fifth day of the eruption become turgid and hemispherical; the suppuration on the face being complete by about the eighth day from the commencement of the fever, and the same process rapidly following in the other parts of the body in the same order of succession as that in which the eruption originally appeared. The pustules then break, and scabs or crusts form over them, which usually fall off after four or five days' existence. The number of pustules in any special case and the severity of the disease, stand in a direct ratio to one another; for "the number of pustules indicates, in the first place, the quantity of the variolous poison which has been reproduced in the blood; and, in the second place, it is also a direct measure of the extent to which the skin suffers inflammation. Sometimes there are not more than half-a-dozen pustules; sometimes there are many thousands. If all these were collected into one, it would be an enormous phlegmon. For both these reasons, the system suffers commotion, distress, and peril, in proportion to the quantity of the eruption."—Watson's *Lectures*, etc., 4th ed. vol. ii. p. 857. The progress of the pustules is usually accompanied with swelling of the skin of the face, with a painful sensation of heat and tension; the scalp is often swollen; soreness of the mouth and salivation usually supervene; and the patient exhales a peculiar and disagreeable odor. About the eighth or ninth day of the disease, a recurrence of the fever, known as "the fever of maturation," sets in with varying degrees of intensity, according to the number and arrangement of the pustules. When the pustules are numerous, they run together; when they are few, they keep

separate. Hence the division of small-pox into the two great varieties of *distinct* and *confluent*, or *variola discreta* and *variola confluens*; and this division is of the highest importance, because the distinct form of the disease, in which the pustules are isolated, is scarcely ever dangerous; while the confluent form, in which they coalesce, is never free from danger. The *third or declining stage* is, in the distinct variety, little more than a period of convalescence. About the eleventh or twelfth day, the pustules on the face become brown and dry at the top, or some of them break, and the fluid which oozes out solidifies into a yellowing crust; and from this time the process of *desiccation* goes on, the swelling of the face subsides, and at last only dry scabs remain, which gradually fall off about the fourteenth day. It is not till three or four days after the scabs have formed on the face, that the same process is completed over the whole body. The scabs are usually completely gone by the twenty-first day, leaving behind them blotches of a reddish brown color, which sometimes continue for some months before they quite disappear; and some of the pustules, in consequence of ulceration of the true skin, leave pits, especially on the face, which remain permanently. The period of scabbing is accompanied by various symptoms of improvement: the tongue becomes clean, the appetite returns, and by the time that the scabs have fallen off, the patient may be regarded as restored to health; so that the entire course of a case of distinct or discrete small-pox occupies about three weeks. In the confluent form of the disease, the eruptive fever is more violent, the pain in the back is more severe, and the sickness more obstinate, and the eruption comes out earlier and less regularly than in the distinct variety which we selected for description as representing the more natural course of the disease. Moreover, the pustules do not fill so completely, nor are they of the normal yellow purulent hue, being whitish, brown, or even purple. But the most important difference between the two forms is in the *secondary fever*, which sets in when the pustules are mature. This fever, which is slightly marked in distinct small-pox, is usually intense, and highly dangerous in the confluent form; and it is at this period of the disease that death most commonly occurs. Statistics show that the eighth day of the eruption is the most perilous *day*, and the second week the most perilous *week*. The early occurrence of death—that is to say, during the first week—denotes a peculiar malignancy in the disease. “The nervous system,” says Dr. Watson, “appears to be overwhelmed by the force of the poison. During the second week, the disorder proves fatal chiefly in the way of apnoea; from some affection of the respiratory passages. After that period, the characters of asthenia commonly predominate, the patient sinks under some casual complication, or the powers of life are gradually worn out by so much irritation of the surface, and so large an amount of suppuration.”—*Op. cit.*, vol. ii. p. 860.

The above are the essential symptoms of small-pox, both in the distinct and confluent form. This disease is, however, often accompanied by other symptoms, which we have merely space to name; such as sore throat (which often depends upon pustules situated there), salivation, and (in the confluent form, during the secondary fever) erysipelatous inflammation, leading to the formation of abscesses, glandular swellings, sloughing sores on the sacrum, etc. In pregnant women, the disease often causes abortion, which is most commonly followed by death. The dead child occasionally, but not often, is covered with pustules.

The *cause* of small-pox is universally allowed to be a specific contagion, of whose nature we are in the most profound ignorance. There is probably no disease so contagious as this. Dr. Haygarth stated (in 1793) that, during his long attention to this subject, not a single instance has occurred to prove that persons liable to small-pox could associate in the same chamber with a patient in the distemper without receiving the infection; and he was informed by an American physician of an instance in which the poisonous effluvia crossed a river 1500 feet wide, and affected 10 out of 12 carpenters who were working on the other side. The contagion acts either through the air, or by contact with the skin, or by inoculation; and the disease may be caused by the dead body, even when it has not been touched. What products of the diseased body are contagious is not exactly known, but the contents of the pustules and the dried scabs certainly are so. Opinions are divided as to the period at which the disease begins and ceases to be contagious. It is safest to maintain that it is capable of self-propagation as soon as the febrile symptoms have exhibited themselves. How soon the patient ceases to be dangerous, cannot be decided with accuracy; but the stability of the contagious principle may be inferred from the fact, that clothing will retain it for months, and it is said for years, when confined. Like all the contagious exanthemata, small-pox appears in an epidemic form, at irregular, and, in our ignorance, it would almost seem capricious intervals. After an extraordinary exemption, perhaps for years, a district is suddenly invaded by it, and continues to suffer for a longer or shorter period, after which the disease spontaneously disappears—dies out, as it were—and does not reappear perhaps for years. Different epidemics vary very much in their severity, and isolated cases are usually milder than those occurring when the disease is epidemic. Race has much to do with the severity of the disease; the constitution of the dark races, the negro and the red Indian, being singularly susceptible of the contagion, and exhibiting very little power of resisting the fatal tendency of the disease.

It is universally admitted that the discovery of *vaccination* (q.v.), by which small-pox is deprived of its danger, is the greatest triumph of modern medicine. *Inoculation* (q.v.)

protected the individual, but increased rather than diminished the total number of deaths, while vaccination has the advantage of protecting both the individual and the community. Although, in the great majority of cases, vaccination affords perfect protection against small-pox, it not very infrequently happens that vaccinated persons, when exposed to the contagion of small-pox, get the disease in a modified form, milder and shorter even than after inoculation, and therefore incomparably milder than in the natural form. The disorder occurring under these circumstances has received the various names of *modified* or *post-vaccinal* small-pox, or the *varioid* disease. As Dr. Wood observes: "It is impossible to describe minutely all the shapes which the varioid disease assumes. There is every shade between the slightest symptoms, scarcely recognizable as having affinity with small-pox, and the nearest possible approach to the regular disease."—*Practice of Medicine*, 4th ed., vol. i., p. 380. In whatever form the varioid disease appears, it wants the peculiar odor of small-pox, and secondary fever is very rare. The constitutional disturbance which, for the first week, may have been as severe as in the true disease, usually subsides entirely when the eruption has reached its height, and the patient is convalescent at the period when, if he had not been vaccinated, he would have been in the greatest danger.

With regard to prognosis, it may be stated generally, it is a very fatal, and was formerly an extremely destructive disease—one death occurring in every four cases. Modified small-pox is very seldom fatal, although instances of death are occasionally reported. Small-pox is more fatal at the two extremes of life than in the intervening period, and, as has been already noticed, is especially dangerous in pregnancy. In olden times, it was believed that the eruption was an effort of nature to get rid of the noxious matter, and hence heating and stimulating measures were adopted with the view of promoting the eruption. To Sydenham (q.v.) belongs the credit of first recommending an entirely opposite or cooling mode of treatment; but his suggestions met with the most severe opposition, and it was not till long after his death that the cooling treatment was fairly established. In mild cases, and in cases of varioid disease, the physician has merely to guard the patient against hurtful influences, such as stimulating foods or drinks, too hot a room, or improper exposure to cold, and to prescribe cooling drinks during the fever, and occasional laxatives if they shall be required. In more severe cases, the fever may be combated by saline purgatives, prescribed so as to produce two or three liquid stools daily, and by free ventilation of the surface of the body. When the eruption is all out, if the pimples on the face are few and distinct, the danger may be regarded as over, and no further treatment is required. If, however, the disease assume a confluent form, wakefulness and restlessness are apt to come on about the eighth day, and opiates in free doses may be prescribed with benefit. If the pustules are abnormally torpid in reaching their maturity, it may be expedient to administer strong broths, or even wine; and when the pustules are livid, and intermixed with petecchiæ (q.v.), bark and acids must then be additionally ordered, although the patient is then too often beyond the reach of help. During the secondary fever, the bowels must be kept gently open, and opiates should be prescribed once or twice each day. A more nourishing diet is now called for, and wine should be given if the pulse is very weak. The external itching is partly relieved by the opiates, but local applications are also employed: cold cream, or a mixture of equal parts of olive oil and lime-water, may be thus used with advantage. Special methods have been devised for the purpose of preventing the pitting or seaming of the face, which is often a hideous permanent disfigurement of the patient. The best application of this kind is probably that of nitrate of silver. Mr. Higginbottom, who first suggested this application, touched each distinct papula with a solid stick of lunar caustic, previously moistened; but when the spots were confluent, he washed the whole face, about the third day after the eruption, with a strong solution of this salt, containing eight scruples to the ounce of water. In the Paris hospitals, various mercurial preparations are employed, which are said to cause the pustules to abort. M. Briquet recommends mercurial ointment, simply thickened with powdered starch. Dr. Wood of Philadelphia remarks, that as the ointment sometimes salivates, it should be diluted with an equal quantity of lard before the starch is added. Prof. Bennett of Edinburgh recommends the application of calamine (carbonate of zinc) mixed with olive oil; it forms a coherent crust, and thus excludes the air.

During the period of desquamation, an occasional warm bath may be prescribed with advantage; and the patient should always resort to this measure, as a precaution against carrying the contagion about with him, before again mixing in society.

The history of this remarkable disease is clothed in considerable obscurity. There is no evidence that it was known to the Greek or Arabian writers of the 6th c., and the first accurate description of it is that of Rhazes, an Arabian physician, who flourished early in the 10th century. It appears to have reached England toward the close of the 9th c. After the crusades it prevailed in most of the temperate countries of Europe, but did not reach the northern countries of Norway, Lapland, etc., for some time later. In 1517 it was carried from Europe to St. Domingo; and three years later, it reached Mexico, where it committed fearful devastations, and whence it spread with intense virulence throughout the new world. (According to Robertson, three millions and a half of people were destroyed in Mexico alone.) In 1707, it was introduced into Iceland, when more than a fourth part of the whole population fell victims to it; and it reached Greenland still la-

ter (in 1733), when it spread so fatally as almost to depopulate the country. These cases are striking illustrations of the law that seems universally true, that a contagious disease is always most virulent on its first introduction to a new scene of action.

SMALL-POX IN SHEEP, *Variola ovina*, although resembling the small-pox of men, is a distinct disease, not communicable either by contagion or inoculation to men or children, or even to dogs or goats. Although common on the continent of Europe, it was unknown in Gt. Britain for at least a century, until in 1847 it appeared in Norfolk and the eastern counties, and in the summer of 1862 in Wiltshire near Devizes. Variolous sheep or infected skins appear in both cases to have imported the disease from abroad. About ten days after exposure to contagion, the infected sheep become feverish, have a muco-purulent nasal discharge, and a hot, tender skin. The red pimples which first appear, in about three days become white, and afterward leave scabs or ulcers. The weakness is great, and the mortality varies from 25 to 90 per cent. Good food and nursing are the appropriate remedies.

SMALLS, ROBERT, b. Beaufort, S. C., 1839, a slave, but managed to educate himself in a limited degree. In 1851 he began a seafaring life; became connected with a Charleston steamer, and delivered her to the commander of the U. S. blockading squadron, 1862. He was made a pilot in the union service, and was promoted to capt., 1863; was a member of the S. Car. constitutional convention, 1868, and of the state legislature, 1868, and state senate, 1870-74; was appointed maj.-gen. of state militia; was a repub. representative in congress, 1875-79 and 1881-87.

SMALLWOOD, WILLIAM, about 1732-92; b. Md.; in the revolution commanded a Maryland battalion; was present at White Plains, in Sullivan's Staten Island expedition, and at the battle of Germantown. He refused to serve under baron Steuben, and left the army with the rank of maj.-gen. In 1785 he was elected to congress, and was governor of his native state, 1785-8.

SMALT, a name applied to the colored glass compositions used for making the tesserae employed in forming mosaics. See also **COBALT**.

SMART, BENJAMIN HUMPHREY, b. England 1785; a teacher of elocution in London. He was considered an authority upon English orthoepy, and was a voluminous writer on many topics. Among his works may be mentioned *Grammar of English Pronunciation* (1810), *Grammar of English Sounds* (1813), and a *Pronouncing Dictionary* (1836), founded upon Walker's. He died 1872.

SMART, CHRISTOPHER, 1722-71; b. Kent, England, educated at Cambridge, where he took the Seatonian prize for poetry 5 years in succession. In 1753 he came to London and endeavored to make a living by his pen. He translated the Psalms, Horace, and Phædrus, into English verse, and made a prose translation of Horace. His original poems show considerable talent, and were published in collected form. He became insane through dissipation and deprivations, and died in a debtor's prison.

SMART-MONEY. See **RECRUITING**.

SMARTWEED. See **POLYGONÆÆ**.

SMEATON, JOHN, an eminent civil engineer, was b. at Austhorpe, near Leeds, in 1724, and early showed a bent toward mechanical pursuits. At the age of 15, he had constructed a machine for rose-engine turning. About 1750, he removed to London, to commence business as a mathematical instrument maker; but we find him in the following year resuming his desultory experiments in mechanical invention; an "odometer" for ships, a compass, and improvements in water and wind-mill machinery, being the chief products of his inventive genius. His improvements on mill-work were found on trial to be of great value, increasing the effective force by one-third, and gained Smeaton the Copley medal of the royal society in 1753. In 1753, he was chosen a member of the royal society; and in the following year, to extend his practical acquaintance with engineering, he visited the Netherlands, and inspected the embankments, canals, and other remarkable works of that country. In 1755, an event occurred which was to afford him the opportunity of attaining the very summit of his profession—the second wooden light-house on Eddystone rock was destroyed by fire in December. The speedy re-erection of another beacon was of the utmost importance, and the execution of the work was intrusted to Smeaton. The new light-house was built of stone; the cutting of the rock for the foundations commenced in Aug. 1756, the building was executed between June 1757, and Oct. 1759, and the lantern lighted on Oct. 16 of the latter year. This great work, the greatest of its kind hitherto undertaken, remained 120 years a stable monument of Smeaton's engineering skill. Yet he seems to have had little employment for some time subsequently, as he applied for and obtained in 1764 the post of "receiver of the Derwentwater estate," the funds of which were applied for the behoof of Greenwich hospital; and this situation he held till 1777, by which time he was in full professional employment. The chief of his other engineering works were the construction of the greater portion of Ramsgate harbor (1744); the laying out of the line of the Forth and Clyde canal, and the superintendence of the excavation of most of it: the rendering of the Calder (Yorkshire) navigable; the erection of Spurn light-house, and of several important bridges in Scotland; together with an immense amount of mill-machinery. He also greatly improved Newcomen's steam engine, but the mighty achievements of Watt in the same field threw his labors completely into the shade. He is said to

have prevented the fall of the old London bridge for many years by sinking a great quantity of stones around one of the piers, which had become undermined by the strength of the Thames current. In 1783, his health began to decline, and he retired from active business, dying at Aushorpe of paralysis, Oct. 28, 1792. He was one of the chief promoters of the "Society of Civil Engineers," which was started in 1771, and after Smeaton's death published (1797), in three 4to volumes, his numerous professional reports, which were regarded by his successors "as a mine of wealth for the sound principles which they unfold, and the able practice they exemplify." For a large portion of his life Smeaton was in constant attendance on parliament, which, in difficult or important engineering schemes invariably demanded, and almost always followed his advice—a proof not only of his eminence in his profession, but of his caution, judgment, and integrity. See the biography prefixed to his "Reports."

SMEE, ALFRED, b. England, 1818; member of the college of surgeons, 1840; fellow of the Royal Society, 1841; lecturer to the Aldersgate street school of medicine, surgeon to the bank of England, senior surgeon to the royal general dispensatory; a thorough student of electricity. He invented the Smee *voltæic battery* and the method by which the bank of England notes are printed. S. was a conservative politician, and author of numerous works on physiology, electricity, etc. He d. 1877.

SMELL. See NOSE.

SMELLIE, WILLIAM, 1740-95; b. Edinburgh Scotland; became a printer, educated himself, and in 1759 was editor of the *Scots Magazine*. In 1771, then being a publisher, he issued the first edition of the *Encyclopædia Britannica*, many of the articles being written by himself. From 1773 to 1776 he was joint editor with Gilbert Stuart of the *Edinburgh Magazine and Review*. He was the author also of *The Philosophy of Natural History* (1790-99), which was reprinted in this country.

SMELT, *Osmerus*, a genus of the salmon or trout family (*salmonidæ*), of which only a few species are known, differing from the salmon, trout, etc., in having long conical teeth on the jaws and tongue, and on the tip of the vomer, the rest of the vomer being destitute of teeth; two distinct rows of teeth on each palatine bone.—The COMMON SMELT (*O. eperlanus*), called *spirling* or *spurling* in Scotland, and *eperlan* in France, is a fish of 8 or 10 in. (rarely 12 in.) in length. The form is very trout-like—rather more slender—the tail larger in proportion and more forked. The lower jaw is much longer than the upper. The scales are small; the back is whitish, tinged with green; the upper part of the sides shows bluish tints, the lower part of the sides and the belly are of a bright silvery color. The smelt has a peculiar cucumber-like smell and a delicious flavor, on account of which it is highly esteemed for the table, where it often appears as an accompaniment of other fish. The smelt is partly an inhabitant of fresh water, and partly of the sea. It ascends rivers to no great distance from the sea in autumn, and descends in spring. Great numbers of smelts are taken in estuaries and near the mouths of rivers by small-meshed nets. They are also taken on the open sea-coast, chiefly on low sandy shores as that of Lincolnshire. The attempt has been successfully made to keep the smelt continually in fresh-water ponds, in which it not only thrives well without loss of flavor, but propagated abundantly. No effort has yet been made to turn this discovery—not a very recent one—to any economical account. Although found both on the eastern and western coasts of Britain, the smelt is unknown on the s. coast of England, where the name smelt or SAND SMELT is given to the atherine (q.v.).—Another British species, the Hebridean smelt (*O. Hebridicus*), was first discovered near Røthésay in 1837 and described by Yarrell. It is so rare as to be unimportant.—The AMERICAN SMELT (*O. viridescens*) is regarded as distinct from the common smelt. It has a longer body and a greener back. It is found on the north-eastern coasts of America as far s. as the Hudson.

SMELTING. See IRON.

SMERDIS, the younger son of Cyrus, put to death secretly by the order of his brother Cambyses, who was jealous of him. The governor of the palace having a brother strikingly resembling the murdered prince, set him up as the true Smerdis, and on the death of Cambyses had him proclaimed king. Some of the Persian nobles soon suspected the cheat, and were satisfied of it when they found that the false Smerdis had no ears. Seven nobles then entered the palace and killed the pretender after he had reigned seven months. After this Darius Hystaspes was chosen king B.C. 521.

SMET, PETER JOHN DE, 1801-72; b. Belgium; educated at Mechlin; came to the United States in 1831; entered the Jesuits' novitiate at Whitmarsh, Md.; was one of the founders of the university of St. Louis; superintended missions among the Pottawottamie and Flathead Indians in 1840, and had great influence over the tribes. He published *Oregon Missions*; *Western Missions and Missionaries*; *Letters, Sketches, and Residence in the Rocky Mountains*.

SMETANA, FRIEDRICH (1824-84), a Bohemian composer and pianist, pupil of Franz Liszt. From 1866 to 1874 he was conductor at the National theater in Prague, resigning on account of deafness. He wrote the operas, *Married for Money*, *The Brandenburger in Bohemia*, and the *Bartered Bride*, which last attracted much attention in Vienna in 1892.

SMEW, *Mergellus albellus*, a bird of the family *scoliadæ*, very nearly allied to the goosander and mergansers, but having a shorter bill. The whole length of the male is not quite 18 in.; that of the female, not quite 15. The smew is only known in Britain as a winter visitant, appearing in greatest numbers in severe winters, and sometimes on inland lakes and ponds, as well as on the sea-coast. It abounds on the northern coasts of Asia, and in some parts of continental Europe.

SMILACEÆ, a natural order of exogenous plants, ranked by Lindley in his class dictyogens (q.v.), and consisting of herbaceous or half-shrubby plants, generally more or less climbing, with reticulated leaves, and bisexual or polygamous flowers, a 6-parted perianth, six stamens, a free 3-celled ovary, with cells one or many seeded, three stigmas, and a roundish berry. There are about 120 known species, mostly of the genus *Smilax*, scattered over the globe, but most numerous in the temperate and tropical parts of Asia and America. The root stocks (*rhizomes*) of many species yield sarsaparilla (q.v.). But some species have fleshy tubers, particularly *Smilax China*, a native of China and Japan, the tubers of which are very large and nutritious and used for food. *Smilax pseudo-China*, an American species, has similar tubers.—The roots of *Roxburghia viridiflora*, after being boiled and soaked in lime-water to remove their acidity, are preserved in syrup as an article of food in the Eastern peninsula and Malayan Islands. The stems of this plant are sometimes 100 fathoms long. See **SMILAX**.

SMILAX. A kind of endogenous and sometimes prickly plants that climb by tendrils. It is found in warm climates, and several species are found in the eastern part of the United States, among them the greenbriar or catbriar (*Smilax rotundifolia*), which is found from Canada to the Southern states, spreading over shrubs and trees, its stems extending sometimes to a length of 40 feet. It is a favorite decoration for houses combined with various flowers. See **SMILACEÆ**.

SMILES, SAMUEL, b. Scotland, 1812; educated as a physician, but practiced a short time only. He was editor of the *Leeds Times*; in 1845 became connected with railway management, and continued in this until 1866. He has written many biographical and didactic books, such as the *Life of George Stephenson* (1858); *Self-Help* (1860), which attained a large circulation; and *Duty* (1880). His works are prized for practical moral and social lessons.

SMILLIE, GEORGE H., b. New York, 1840; son of James, the landscape engraver; studied painting with James M. Hart; opened a studio in 1862; exhibited for the first time, 1864. His "Sunny Brook Farm" brought him into notice, and he became an academician of the National Academy of Design in 1882. His favorite subjects are scenes from the Adirondacks and White Mountain views.

SMILLIE, JAMES D., b. New York, 1833; employed by the American bank-note company as engraver until he went to Europe in 1862 to study painting. He became a member of the National Academy in 1865, having been associated with his brother George H. for the year previous. One of his most attractive pictures is "Ausable Lake," in the Adirondacks. He illustrated Bryant's poem, *Among the Trees*, with 22 plates.

SMIRKE, SIR ROBERT, 1780-1867; b. England; began to practice his profession as an architect in London in 1805. Among his works in the classic style are the College of Physicians, the Post-Office, the Mint, and the British museum; in the Gothic style, the extension of the Inner Temple, and the restoration of York minster. He published *Specimens of Continental Architecture* (1806).

SMIRKE, SYDNEY, b. England in 1799; brother of Sir Robert, and himself an architect. His most important works are the Oxford and Cambridge University club, Pall Mall front, restorations in the Temple church, 1842. Peel's portrait gallery at Drayton manor, the Carlton club, and (in connection with Mr. Panizzi, the librarian) the great British Museum reading-room, of which the dome has a diameter but two ft. less than that of the Roman Pantheon. He d. 1877.

SMITH, a co. in n. Kansas, adjoining Nebraska; drained by Solomon river and several creeks; pop. '90, 15,613, chiefly of American birth. The surface, a rolling prairie, affords excellent pasture land; wheat, corn, and oats are staples. Area, 900 sq. m. Co. seat, Smith Centre.

SMITH, a co. in central Mississippi, drained by Strong and Leaf rivers; 630 sq. m.; pop. '90, 10,635. The surface is nearly level, with large forests of oak, pine, magnolia, and other trees; the soil is poor and sandy. The main productions are cotton, rice, Indian corn, sweet potatoes, and wool. Sheep and swine are raised in large numbers. Co. seat, Raleigh.

SMITH, a co. in n. Tennessee, intersected by Cumberland river and Caney fork; 368 sq. m.; pop. '90, 18,404. Co. seat, Carthage.

SMITH, a co. in n.e. Texas; drained by the Sabine river, its n. boundary, and by the Neches and Angelina; area, 930 sq. m. Pop. '90, 28,324. Co. seat, Tyler.

SMITH, ADAM, the founder of political economy as a separate branch of human knowledge, was b. in the town of Kirkcaldy, in Fifeshire, on June 5, 1723. His family belonged to the respectable middle class of Scotch life; his father was comp-

troller of the customs of the port of Kirkcaldy, and his mother, Margaret Douglas, was the daughter of a small Fifeshire laird. His father died a short time before his birth, and he was the object of the care and solicitude of a widowed mother, to whom he was closely attached, and who long lived to be proud of his attainments. When he was no more than three years old, the poor woman got a sad fright, from a calamity hardly known at the present day—the child was stolen by gypsies; but he was tracked and recovered by his uncle as they were seeking a hiding-place in the neighboring wood of Leslie. This was the only adventure in his quiet life. After getting the usual burgh-school education in Kirkcaldy, he was sent, in 1737, to the university of Glasgow. He there secured an exhibition on the Snell foundation, which took him to Balliol college, Oxford. He studied there for seven years, and left traditions as of a man of large acquirements and peculiar independence of thought. It is said that he was intended for the English church, but if so, his own convictions crossed the designs of his friends. He returned to Kirkcaldy, and lived for a while with his mother there in undisturbed seclusion and study. It was said to be his practice to stand ruminating, with his back to the fire, and his head leaning against the chimney-piece—and over an old fireplace in Kirkcaldy it used to be shown how he had thus worn a piece off the paint. In 1748 he came to Edinburgh, where silently and unostentatiously he became one of the brilliant little circle of men of letters who were then rising to importance. In 1751 he got the chair of logic in the university of Glasgow, and this was changed a year afterward for that of moral philosophy. In 1759 appeared his *Theory of Moral Sentiments*; celebrated for its reference of the mental emotions to the one source of sympathy. The *Dissertation on the Origin of Languages* was published along with the later editions of this book. Both had a great reputation in their day, and although they are now among obscure books in comparison with that other by which the author's name is remembered, the position they held with respectable thinkers gave a hearing to his doctrines on political economy which they would hardly have otherwise obtained. In 1762 the university of Glasgow gave him the degree of doctor of laws. In the following year he undertook a task, which might at first seem very uncongenial to a mind like his, given to retired study and independent thought and action. He became "governor" or traveling tutor to the young duke of Buccleuch. He was then sedulously collecting materials for his great work, and no doubt the inducement to accept of the office was the opportunity it gave him for traveling and seeing for himself. He had the opportunity of being nearly a year in Paris, and of mixing in the circle of renowned wits and philosophers of the reign of Louis XV. In 1766 his function came to an end, and he returned to Kirkcaldy to live in the old house with his mother. The year 1776 was an era in the history of the world as well as that of the Kirkcaldy recluse, in the appearance of the *Inquiry into the Nature and Causes of the Wealth of Nations*. If there was any living man to whose works he was indebted for the leading principles of this book, it was David Hume, and it was from him, as best understanding the fullness and completeness of the exposition, that it had its first emphatic welcome. He wrote immediately on receiving it: "EUGE BELLE.—DEAR MR. SMITH—I am much pleased with your performance; and the perusal of it has taken me from a state of great anxiety. It was a work of so much expectation by yourself, by your friends, and by the public, that I trembled for its appearance, but am now much relieved. Not but that the reading of it necessarily requires so much attention, and the public is disposed to give so little, that I shall still doubt, for some time, of its being at first very popular. But it has depth, and solidity, and acuteness, and is so much illustrated by curious facts, that it must at last take the public attention." This was not destined to be exactly the literary history of this great work. Its startling doctrines, fine clear style, and abundant illustration from curious facts took at first; but counteracting influences arose when people saw how far the new doctrines went in playing havoc with old prejudices. The French revolution set the minds of the English bigoted against everything that breathed of innovation. It was known that the younger Pitt participated at first in Smith's free-trade notions, but he had afterward, whether from permanent connection or temporary policy, to put himself in the foremost ranks of the enemies of innovation. It was not until long after the terrors of that epoch and the nervous vicissitudes of the war had passed over, that Smith's work had an opportunity to revolutionize the public mind on matters of trade and finance. It came up, as it were, the leader of a great literary host, for expounders had crowded in numbers round *The Wealth of Nations* as the text-book of sound economy. Of a book so well known and so much read it is needless to speak. The only reproach brought against it is that it is not systematic in its form, and that its nomenclature is not exact. But its author was not arranging the results of established knowledge—he was rather pulling down existing structures, compounded of ignorance and prejudice. Nor, indeed, have those who have attempted to make an exact science out of political economy practically vindicated the reproach they have cast on him of being unmethodical. Whatever we may yet come to, very few portions indeed of political economy admit of being treated as exact science. It is too closely connected with human passions and energies, and consequently with special results and changes, to be so treated; and the best books on the subject are still characterized by the discursiveness and mixed philosophy and fact of the *Wealth of Nations*. In 1778, Smith was made a commissioner of customs. The only effect of this was to bring him to Edinburgh, and increase his means for indulging in his favorite weakness, the collection of a

fine library; for he was, as he called himself, a "beau in his books." In 1784 he suffered that affliction which was sure to come if he lived long enough for it—the loss of his worthy mother. He followed her six years afterward, dying in July, 1790.

SMITH, ALBERT, 1816–60; b. England; a surgeon, who settled in London in 1841, and became a regular writer for the press, including *Bentley's Miscellany* and *Punch*. He ascended Mont Blanc in 1851, and his "entertainments" on that subject were successful for some years. He also went to China, and on his return gave a Chinese "entertainment." His *Story of Mont Blanc* appeared in 1853; *To China and Back*, in 1859.

SMITH, ALEXANDER, poet, was b. at Kilmarnock, in Ayrshire, Dec. 31, 1830; received, as a boy, a fair English education, and passed from school into a Glasgow warehouse as a pattern designer. While following this occupation, he began to write poetry. His first volume entitled the *Life Drama*, was published in 1853, and created something like a furore in literary circles. A reaction, however, followed, and the author had scarcely found himself famous when he began to be abused. The faults of his book were obvious enough; every page contained evidence of immaturity, and its natural result, extravagance; while a rather narrow reading having made him passionately attached to a few modern poets, as Keats and Tennyson, their peculiar turns of expression reappeared in his verse, and gave color to the charge of plagiarism, which was pushed to an absurd length. But impartial critics were not slow to perceive a richness and originality of imagery that more than atoned for all defects of taste and knowledge. In 1854, Smith was appointed secretary to the university of Edinburgh; and in the following year, along with Sydney Dobell (q.v.), produced a volume of *Sonnets on the War*. He afterward wrote *City Poems* (1857), *Edwin of Deira* (1861), and several prose works, as *Dreamthorp* (1863), *A Summer in Skye* (1865), and *Alfred Hagart's Household* (1866). Smith was perhaps not less distinguished as a writer in prose than in verse, his prose style being marked by picturesqueness, polish, and originality. He died in 1867.

SMITH, ANDREW JACKSON, b. Penn., 1815; graduated at West Point. Before the war of the secession he served on the frontier against hostile Indians; col. 2d California cavalry, 1861; brig.-gen. vols., 1862. He was chief of cavalry in Missouri and Mississippi, in the army of the Tennessee, and in the Yazoo expedition; and was at Chickasaw Bluffs, the capture of Jackson, and the capture of Mobile. He was mustered out of the volunteer service in 1866, and retired from the regular army, 1869. For gallantry in Mississippi and Tennessee, brevetted col., brig.-gen., and maj.-gen. Jan. 22, 1889, he was reappointed colonel of cavalry, and simultaneously placed on the retired list.

SMITH, ASA DODGE, D.D., LL.D., 1804–77; b. Mass.; graduated at Dartmouth college in 1830, and at Andover theol. seminary in 1834; pastor of Fourteenth street Pres. church, New York, 1834–63; became president of Dartmouth college in 1863; resigned in 1877, and died in Hanover the same year. He published *Letters to a Young Student*; *Importance of a Christian Ministry*; *The Puritan Church's Stewardship*, and other sermons. During his pastorate in New York he was one of the most prominent and successful ministers of his denomination in that city; and his presidency of Dartmouth was notable for the good work done in the college and its associated schools, and for the large amounts of money secured for it through pres. Smith's influence.

SMITH, AZARIAH, 1817–51; b. N. Y.; graduated at Yale college in 1837; studied medicine; studied theology at New Haven in 1839, and took medical degree; sailed 1842 as a missionary of the American board for the Levant; traveled extensively in Asia Minor; settled in Aintab in 1848. He contributed papers on meteorology and Syrian antiquities for Silliman's *Journal of Science*.

SMITH, BENJAMIN BOSWORTH, b. R. I., 1794; studied at Brown university; ordained, 1818; consecrated bishop of the Protestant Episcopal diocese of Kentucky, 1832. He was the editor of the *Episcopal Register*, of Vermont, 1827, of the *Episcopal Recorder*, Philadelphia, 1829. He was the senior bishop of his church at the time of his death in 1884.

SMITH, BUCKINGHAM, 1810–71; b. Ga.; graduated at Harvard law school 1836; practiced for a time in Maine, but in 1850 was made *chargé d'affaires* in Mexico. From 1853 to 1859 he was secretary of the Madrid legation. He published several books and papers on the conquest of Florida, De Soto's discoveries, and kindred topics.

SMITH, CHARLES FERGUSON, 1807–62; b. Penn.; graduated at West Point and served with distinction through the Mexican war. During the war of the secession he was in the federal army, in which he rose to be maj.-gen. He was for some time commander of the federal forces in Kentucky, and led the decisive charge at fort Donelson.

SMITH, DANIEL, about 1740–1818; b. Va.; one of the first settlers of Tennessee, and a revolutionary patriot. After the war he held several local offices, was member of the Tennessee constitutional convention, and U. S. senator, 1793–99 and 1806–09. In 1799 he published the first map of the state.

SMITH, EDMUND KIRBY, b. Fla., 1824; graduated at West Point, 1845; served with distinction in the Mexican war and afterward taught at the academy. He resigned in 1861 with rank of major, and entered the confederate army, serving as brig.-gen. under

Johnson, and heading the fresh troops which decided the battle of Bull Run. In 1862 he was made lieutenant-general. In 1863 he was with the Mississippi army, and surrendered to Gen. Canby in 1865. He became professor of mathematics in the university of the South at Sewanee, Tenn., where he died, March, 1893.

SMITH, EDWARD P., 1827-76; b. Conn.; educated at Dartmouth and Yale colleges and the theological seminary of New Haven; pastor for several years of the Congregational church at Pepperell, Mass.; was field-secretary of the U. S. Christian commission during the secession; after the war general agent for the American missionary association in the southern states; appointed U. S. commissioner of Indian affairs, 1873; went to Africa 1875, to visit the missions of the American missionary association; reached the river Gambia, where he died. He published *Incidents of the United States Christian Commission*. He had excellent administrative ability, and earnest Christian philanthropy.

SMITH, ELI, D.D., 1801-57; b. Conn.; graduated Yale college 1821; left Andover theol. seminary 1826, and went as a missionary of the American board to Turkey; made a missionary tour, 1829, through Greece; again through Armenia and Georgia to Persia, which opened the way for a mission to the Nestorians; made with Dr. Robinson, 1837, a tour in Egypt and Palestine, ably aiding his researches in Biblical geography. A good classical and Hebrew scholar, he acquired also French, Italian, German, and Turkish; and Arabic was to him a second vernacular. He prosecuted with zeal every collateral study in order to qualify himself for what he considered his great work, a faithful translation into Arabic of the word of God. He drew for himself after careful study of the art, with utmost accuracy, models of type, and superintended the cutting, casting, and perfecting of the fonts. An account of his tours was published in two vols.

SMITH, ELIZABETH OAKES (PRINCE), b. 1806, Cumberland, Me.; descendant of gov. Prince of the Plymouth colony and pres. Urian Oakes of Harvard university; removed in infancy to Portland, Me.; married Seba Smith, an editor, while quite young, and wrote prose and verse, and assisted her husband in his profession. In 1839, meeting with financial reverses, she adopted literature as a means of subsistence, and settled in New York in 1842, contributing to the magazines and reviews, corresponding for papers, writing stories, plays, and lectures. She removed to North Carolina, 1876. She published *Woman and her Needs*, 1851. She died, 1893.

SMITH, FRANCIS HOPKINSON, an American landscape painter and author, born at Baltimore, Md., Oct. 23, 1838. He is by profession an engineer, and has built many public works, under contract with the United States, among others, the Race Rock light-house, off the harbor of New London (1871-77), and the Block Island breakwater (1879). As a painter he is self-taught, and won a wide reputation for his effective work in water-colors and charcoal. Among his best known water-colors are, "In the darkling Wood" (1876); "Peggoty on the Harlem" (1881); "Under the Tower, Brooklyn Bridge" (1883); and "A January Thaw" (1887). His water-colors of Venetian scenes have also been much admired for their free and clever treatment. He is also well-known as a book and magazine illustrator, and as the author of *Well-worn Roads* (1886); *Old Lines in new Black and White* (1886); *A Book of the Tile Club* (1887); *Tom Grogan* (1896); *Gondola Days* (1897). He is a member of the American water-color society, and was its treasurer during 1875-78.

SMITH, GEORGE, 1840-76; b. England; in 1866, while examining the Assyrian paper casts in the British museum, discovered an inscription of Shalmaneser II. concerning the war against Hazael; in 1867 aided in preparing a volume of cuneiform inscriptions, and from that time devoted himself to the study of them. Among his earlier discoveries are: a notice of an eclipse, 763 B.C.; of several kings of Israel; of conquest of Babylonia, 2280 B.C.; of Chaldean account of the deluge; in 1871 published a work giving the texts, transcriptions, and translations of documents pertaining to Asshur-bani-pal (Sardanapalus). In 1873-74 he went twice to Nineveh, obtaining 3,000 inscriptions and many other important acquisitions; in 1876 went again to the east and died while exploring the Euphrates valley. In knowledge of Assyrian texts he was unequalled.

SMITH, GERRIT, 1797-1874; b. N. Y.; graduated at Hamilton college in 1818. Being heir to one of the largest properties in the country, his time was occupied chiefly in its care; but he was admitted to the bar in 1853, and practiced to some extent. He was prominent in benevolent undertakings, and associated himself with organizations such as the American colonization society and the American anti-slavery society from an early period. His personal liberality was great, and he divided more than 200,000 acres of land in free gifts, partly among public institutions, but also largely in small parcels of about 50 acres among poor persons, black and white. He also gave large sums in aid of emancipation. He was a member of congress in 1852, and there and everywhere gave the freest vent to his pronounced opinions in favor of liberty of speech, conscience, and the person.

SMITH, GOLDWIN, LL.D., son of a Berkshire physician, was b. at Reading in 1823. He received his education at Eton and Oxford. In 1847 he was elected fellow of University college, where he officiated for a time as tutor. In the same year he was called to the bar at Lincoln's Inn. The ministry of the day availed themselves of Mr. Smith's services in carrying out their plans of university reform. He was nominated assistant-

secretary to the first, and secretary to the second Oxford commission, by which the somewhat antiquated statutes of the university were reconstructed, and the rich endowments of the colleges opened to public competition. Mr. Smith was also a member of the popular education commission appointed in June, 1858. He held the chair of modern history in Oxford, 1858-66. In 1868 he was elected to the chair of English and constitutional history in Cornell university, Ithaca, N. Y. He has lately resided in Canada. Goldwin Smith has long been known as a publicist of the highest class, and has completely identified himself with the more advanced school of reformers. During the American war he was an earnest defender of federal interests, and combated with success in the *Daily News* and elsewhere, the singular theories of the rights of slavery and the duties of neutrals, which were then somewhat fashionable. He was also active in denouncing the Jamaica massacres, and in advocating an extended measure of reform. Mr. Smith's writings are characterized by great extent and accuracy of information, by a style singularly vigorous and condensed, and by great powers of sarcasm. Among his principal publications may be enumerated: *Irish History and Irish Character*; *Lectures on Modern History, with a Supplementary Lecture on the Doctrine of Historical Progress*; *The Empire*, a reprint from the *Daily News* of 1862-63; *England and America*, a lecture delivered before the Boston fraternity, and reprinted from the *Atlantic Monthly*; several pamphlets on the American question; contributions to Oxford essays; *A Short History of England*; etc. He wrote also *Conduct of England to Ireland* (1882); *Canada and the Canadian Question* (1890); *History of the United States* (1893); *Bay Leaves*; *Translations from the Latin Poets*; *Specimens of Greek Tragedy*; and *Essays on Questions of the day* (1894).

SMITH, GREEN CLAY, b. Ky., 1832; educated at Transylvania university. He was a volunteer in the Mexican war, practiced law in Kentucky, of whose legislature he was a member, served in the federal army, 1861-63, and rose to be brig.-gen. He was afterward member of congress and governor of Montana. He died June 29, 1895.

SMITH, HENRY BOYNTON, D.D., LL.D., 1815-76; b. Me.; graduated at Bowdoin college in 1834; was tutor in Greek and librarian 1836-37 and 1840-41; studied theology at Bangor and Andover, Halle, and Berlin. In Germany he was honored by theologians for his learning. In 1842 he became pastor of the Congregational church, West Amesbury, Mass., filling also for two years in connection with his pastoral duties the chair of Hebrew in Andover seminary; was professor of mental and moral philosophy at Amherst college, 1847-50; of church history in Union seminary, 1850-55; and of systematic theology, 1855-73, when enfeebled by unremitting toil he retired from the chair though retained as emeritus professor of apologetics until his death. His publications are: *The Relations of Faith and Philosophy*; *Nature and Worth of the Science of Church History*; *Problem of the Philosophy of History*; *The Reformed Churches of Europe and America in Relation to General Church History*; *The Idea of Christian Theology as a System*; *History of the Church of Christ*; *Chronological Tables*. He edited for many years *The American Theological Review*, and contributed largely to the *Bibliotheca Sacra* and other reviews. He had brilliant scholarship, a fervid and deeply spiritual nature, a gentle and winning disposition; and especially in church history his work has enduring value.

SMITH, HOKE, was born in North Carolina in 1855, receiving there his early education. In 1876 he took up his residence in Atlanta, Ga., where he began the practice of law with much success. He became part proprietor of the *Atlanta Journal*, and in 1892 was President of the Board of Education. In 1893, he was appointed Secretary of the Interior by President Cleveland.

SMITH, ISAAC, 1736-1807; b. N. J.; graduated at Princeton, 1755; was tutor there; studied medicine; col. of a regiment, 1776, in the patriot army, and was distinguished for his patriotism throughout the war. At its close he was appointed judge of the supreme court of New Jersey, holding the office 18 years. He was a member of congress, 1795-97; treated with the Seneca Indians as U.S. commissioner under Pres. Washington, 1797; president of the bank of Trenton, 1807.

SMITH, ISRAEL, 1759-1810; b. Conn.; educated at Yale college, and settled in Vermont, where he was elected to the legislature. He was a member of congress, 1791-97 and 1801-3; chief-justice of the state supreme court in 1797, and U. S. senator, 1803-7. He was a member of the convention that adopted the federal constitution, and was active in securing the admission of Vermont as a state.

SMITH, JAMES, 1737-1812; b. Penn.; captured and adopted by the Indians in 1759, but afterward escaped. He was a lieutenant in Bouquet's expedition in 1764; a col. in the revolutionary war, and afterward a member of the Kentucky legislature. He wrote *Remarkable Occurrences in the Life and Travels of Col. James Smith* (1799).

SMITH, JAMES and HORACE, authors of *The Rejected Addresses*, were sons of an eminent London solicitor. James was b. Feb. 10, 1775, d. Dec. 24, 1839; Horace was b. Dec. 31, 1779, d. July 12, 1849. James followed his father's profession, and succeeded him as solicitor to the board of ordnance; Horace adopted the profession of a stock-broker, and realized a handsome fortune, on which he retired with his family to Brighton. Both were popular and accomplished men—James remarkable for his conversational powers and gayety, and Horace (the wealthier of the two) distinguished for true liberality and benevolence. The work by which they are best known is a small volume of poetical parodies or imitations, perhaps the best in the language. On the

opening of the new Drury Lane theater in Oct. 1812, the committee of management advertised for an address to be spoken on the occasion, and the brothers Smith adopted a suggestion made to them, that they should write a series of supposed "Rejected Addresses." They accomplished their task in the course of a few weeks—James furnishing imitations of Wordsworth, Southey, Coleridge, Crabbe, Cobbett, etc.; while Horace contributed imitations of Scott, Byron (all but the first stanza), Monk, Lewis, Moore, and others. In point of talent, the authors were about equally matched; for though James had the greater number of successful imitations, the one by Horace of Scott, is the most felicitous of the whole. It is a curious fact in literary history that a work so exceedingly popular should have had great difficulty in finding a publisher; and that the copyright, which had been originally offered to Murray for £20, and refused, was purchased by him in 1819, after the book had run through 16 editions, for £131. The authors received above £1000 from the sale of the work. James was afterward an occasional contributor to the periodical literature of the day, and author of the humorous theatrical entertainments of Charles Mathews (for which he received £1000). Horace Smith wrote several novels—*Brambletye House*, *Tor Hill*, etc.

SMITH, JEREMIAH, LL.D., 1759–1842; b. Peterborough, N. H.; graduate of Rutgers college, 1780; distinguished as a lawyer and a scholar; member of congress, 1791–97. He was governor of New Hampshire, 1809–10, chief-justice of the superior court for several years, and intimate friend of Daniel Webster. He published *Sketch of the Character of Judge Caleb Ellis*.

SMITH, JOHN, 1579–1632, b. at Willoughby, Lincolnshire, England. He was left an orphan at an early age, and his guardians permitted him to indulge the roving spirit which distinguished him. At the age of fifteen he accompanied the sons of an English nobleman on a tour of the continent as a page. But he soon left them and enlisted under the Protestant banner in France. He served as a soldier of fortune in different lands, and, according to the memoirs which he published of his life, met with a series of wonderful and romantic adventures. The coloring of romance, however, with which the narrative is imbued is too vivid to appear entirely trustworthy, and contradictions have been discovered in some of his statements. The most remarkable of these records is the account of his victory over three Turks, whom he asserts he slew in single combat under the walls of Regall, in Transylvania. For this achievement he claims to have been ennobled by the ruler of that realm, receiving a patent of nobility (which he publishes in the original Latin) empowering him to emblazon upon his shield the bleeding heads of three Turks—a privilege of which he does not appear to have availed himself. Having returned to England he was induced to take part in the colonization of Virginia, and sailed with the vessels fitted out for this purpose in 1606. He was named a member of the council to direct the affairs of the infant community in the secret list prepared before the departure of the fleet, but during the voyage he was imprisoned on a charge of sedition. On the arrival of the vessels, when the list was examined, he was not allowed to take his seat; he indignantly demanded an immediate trial, which was finally accorded. He established his innocence, but the jealousy of his comrades still excluded him from his seat. But his military reputation, his fiery spirit, tempered by prudence and sagacity, soon made his influence felt, and his advice was often sought by the authorities. With rare magnanimity, considering the injustice with which he had been treated, he did not refuse his assistance. He was sent on several expeditions for forage and discovery among the Indians, and distinguished himself by the ability with which he conducted them. It was on one of these occasions, in Dec., 1607, that Smith was captured by the Indian chief whom in his narrative he calls Powhatan. The story which he relates of the young Indian maiden, Pocahontas, who, when he was condemned to death by the savage chieftan, saved his life by her interposition, has been discredited in many of its details, though there can be no doubt that such a woman lived and was married to an Englishman of the name of Rolfe. Her blood flows in the veins of some distinguished Virginian families. Mr. Charles Deane, in his notes to Wingfield's *Discourse of Virginia* (Boston, 1859) was the first to throw doubts on the truth of this celebrated romance. Smith's influence became paramount in the little settlement, which was called Jamestown, after the reigning monarch. He was elected president of the council, Sept. 1608, and several times saved the colony from ruin by his decision, sagacity, and force of character. In his dealings with the Indians he showed himself an astute and unscrupulous politician, and a valiant soldier, who, by a species of military intuition became at once an adept in all the peculiarities of Indian warfare. His services were not sufficiently appreciated, and he returned to England broken in health and poor in purse. He was sent out on various voyages of discovery, and gave to New England the name she now bears. He died in London, and was buried in the choir of St. Sepulchre's church.

SMITH, JOHN, "of Cambridge," 1618–52; graduated at Cambridge, 1640; fellow of Queen's college, 1644, and for several years tutor and mathematical lecturer there; became a clergyman and was accounted "a man of great abilities, vast learning, possessing almost every grace and virtue which can adorn human nature." His *Select Discourses* were often reprinted and highly esteemed. Several biographies of him have been written by distinguished men.

SMITH, JOHN BLAIR, D.D., 1756-99, b. Penn.; graduated at Princeton, 1773; studied theology with his brother, and succeeded him as president of Hampden Sidney college, 1799; was an effective preacher in Virginia; pastor of the Third Presbyterian church, Philadelphia, 1791-95; president of Union college 1795-99; returned to his pastoral charge at Philadelphia, 1799, and died there of an epidemic disease.

SMITH, JOHN COTTON, LL.D., 1765-1845; b. Sharon, Conn., son of Cotton Mather Smith, descended from John Cotton and Richard Mather; graduated at Yale college, 1783. He practiced law in Litchfield co., 1786; member of the lower house, 1793 and 1796-1800; clerk of the house, 1799; speaker, 1800; member of congress, 1800-6. He was representative from Sharon in the state legislature, 1806-9, and member of the council. He was appointed judge of the supreme court, 1810; lieutenant governor in the same year, and governor, 1813-18. He was a contributor to the periodicals, and a member of several historical and antiquarian societies, A. B. C. F. M., etc.

SMITH, JOHN COTTON, D.D., b. Mass., 1826; graduated at Bowdoin college in 1847; studied theology at Gambier, Ohio; ordained to the Protestant Episcopal ministry in 1849; rector of St. John's church, Bangor, Maine; assistant minister of Trinity church, Boston in 1852; rector of Ascension church, New York, in 1860. He published essays, afterward collected in a volume entitled *Miscellanies, Old and New*, and he published several sermons and lectures. His writings show breadth of Christian spirit, and such certainty of faith as to preclude fear of new phases of truth. He d. 1882.

SMITH, JOHN E., b. Berne, Switzerland, 1816. In the late civil war he was aid-camp to Governor Yates of Illinois; in active duty at fort Henry, fort Donelson, Shiloh, and Corinth; made brig-gen., 1862; engaged in all the important battles of the Louisiana campaign. He was in the Mississippi and Atlanta campaigns in 1864, and marched with Sherman to the sea; col. 14th U. S. infantry, 1870; brevetted maj.-gen. regular army; retired, 1881.

SMITH, JOHN LAWRENCE, b. S. C., 1848; graduated at the University of Virginia, and the medical school of the university of South Carolina; civil engineer on the Charleston and Cincinnati railroad. He studied 3 years in France and Germany, practiced medicine in Charleston, S. C., 1844, and gave lectures on toxicology and agricultural chemistry. In 1846-51 he was mining engineer to the Turkish government, explored Asia Minor, discovered deposits of emery and corundum in the United States; invented the inverted microscope, 1851. He was professor of chemistry in the university of Virginia, and in the university at Louisville, Ky.; U. S. commissioner to the Paris exposition, 1867, and Vienna, 1872. He received the cross of the legion of honor from Napoleon III. He is a member of many scientific societies, president of the American association for the advancement of science, 1872; author of *The Progress and Condition of Several Departments of Industrial Chemistry*, 1867. He d. 1883.

SMITH, JOHN PYE, D.D., LL.D., 1774-1851, b. England; entered an Independent academy at Rotherham, in his 22d year; became classical tutor in the Homerton theological school (Congregational) 1800, divinity tutor 1813-43; and again classical tutor, 1843-50. He was a fellow of the Royal and geological societies. His principal works are: *Scripture Testimony to the Messiah*; *The Sacrifice and Priesthood of Christ*; *The Personality and Divinity of the Holy Spirit*; *Mosaic Account of the Creation and Deluge Illustrated by the Discoveries of Modern Science*, and *Scripture and Geology*.

SMITH, JONATHAN BAYARD, 1742-1812, b. Philadelphia, graduated at the college of New Jersey. He was a merchant in Philadelphia, a member of the continental congress, 1777-78, and for many years a judge of the court of common pleas.

SMITH, JOSEPH, 1790-1877; b. Roxbury, Mass.; d. Washington. He was appointed midshipman, 1809, commissioned lieut. 1813. He distinguished himself at the battle of Lake Champlain, 1814, and at the capture of some piratical vessels of Algiers, 1815. He was made commander, 1827, and capt., 1847, serving with the Mediterranean squadron. For some years he had charge of the Boston navy yard, and was chief of the bureau of yards and docks, 1847-69. He became rear-adm., 1862.

SMITH, JOSEPH. See MORMONS.

SMITH, JUNIUS, LL.D., 1780-1853, b. Conn.; graduated at Yale, and at the Litchfield law school. In 1832 he began to urge a scheme for the navigation of the Atlantic with steamships. He organized the British and American steam navigation company in 1836, under whose direction, two years later, the little steamer *Sirius* crossed the Atlantic.

SMITH, MATTHEW HALE, 1816-79, b. Maine; was a Universalist preacher and afterward joined successively the Presbyterians, Episcopalians, and Baptists; published reasons for some of these changes; became a lawyer, editor, politician, and business man; returned to theology; also was New York correspondent (Burleigh) of the Boston *Journal*. The latter part of his life was spent in New York and Brooklyn.

SMITH, MELANCTON, b. N. Y., 1810; entered the navy in 1826, and through successive grades became rear-admiral (retired) in 1870. He served through the Seminole war, fought the confederate steamer *Florida* in 1861, ran the confederate ram *Manassas* ashore at the capture of New Orleans, took part in the attacks on Port Hudson

fought the ram *Albemarle* in 1864, and commanded the frigate *Wabash* in the attacks on fort Fisher.

SMITH, MILES, D.D., 1550-1624, b. England; graduated at Oxford; studied deeply patristic literature and the oriental languages; became bishop of Gloucester, 1612; was a principal translator of King James's version of the Bible, for which he wrote the preface. A volume of his sermons was printed after his death.

SMITH, MORGAN L., 1822-74, b. N. Y.; enlisted in the regular U. S. army when young, and for gallantry in the Mexican war was made sergeant. He then engaged in business, and in 1861 raised and commanded a regiment from Illinois and Missouri. He was at fort Donelson and in the Shiloh, Vicksburg, and Chattanooga campaigns. He was promoted to the rank of maj.-gen. and commanded a division in Sherman's march to the sea. After the war he was consul at Honolulu.

SMITH, NATHAN, 1762-1828, b. Mass.; studied medicine, and in 1798 became professor in the medical school just established at Dartmouth college. He also delivered lectures at Bowdoin college, and at the university of Vermont. He wrote *Practical Essays on Typhus Fever* (1824); and *Medical and Surgical Memoirs* (1831).

SMITH, PERSIFER FRAZER, 1798-1858: b. Philadelphia; graduated at Princeton college 1815; studied law and practiced at New Orleans. He served in the Florida war, commanded the Louisiana brigade in the Mexican war under Taylor, and was brevetted brig.-gen. and maj.-gen. for gallantry at Monterey, Contreras, and Churubusco. He was a commissioner to conclude peace with Mexico, governor of Mexico, 1847, of Vera Cruz, 1848, also military commander of California and Texas.

SMITH, RICHARD, b. Ireland, 1823; when eighteen years of age came to the United States and settled in Cincinnati, where he worked in a carpenter shop for three years, when he became a reporter. In 1849 he received the appointment of superintendent of the Cincinnati chamber of commerce, and bought the *Price Current*, which he edited. In 1854 he bought into the *Gazette*, now the *Commercial-Gazette*, and after a few years became its managing editor, and still occupies the position.

SMITH, RICHARD SOMERS, b. Philadelphia 1813; graduated at West Point, where he was assistant professor of drawing, 1840-56, when he resigned from the army and became professor of mathematics and drawing in the Brooklyn polytechnic institute, where he remained till 1859. He served in the war against secession till 1863, when he resigned to become president of Girard college, where he remained till 1868. He was, 1868-70, professor of engineering at the Pennsylvania state polytechnic college, and of drawing at the U. S. naval academy, 1870-77; author of manuals on drawing and perspective. D. 1877.

SMITH, ROBERT, D.D., 1732-1801; b. England; graduated at Cambridge, and obtained a fellowship there; became rector of St. Philip's church, Charleston, S. C., 1759; was a volunteer soldier during the revolution; preached in Queen Anne co., Md.; president of Charleston college, 1786-98; first bishop of the diocese of South Carolina, 1795.

SMITH, ROBERT ANGUS, PH.D., b. Glasgow, Scotland, 1817; studied at the university of Glasgow and with Liebig at Giessen. He became a professional chemist; has given much study to disinfectants, ventilation, and climatology, and has published many papers on these and kindred subjects. In 1857 he was made a fellow of the Royal society, has been president of the Manchester literary and scientific society, and is a member of other scientific associations.

SMITH, ROBERT PAYNE, D.D., b. England, 1818; graduated at Pembroke college, Oxford, 1841, obtaining there three oriental scholarships; curate of Trinity, master of the Edinburgh academy, and afterward head-master of Kensington school; sub-librarian of the Bodleian library, having charge of oriental manuscripts, 1857-65; canon of Christ-Church, Oxford, and regius professor of divinity, 1865-71; and dean of Canterbury 1871 to the present time. He was a delegate to the evangelical alliance at New York, 1873, and was a member of the Old Testament revision committee. His published writings include several works of oriental scholarship; a defense of the authenticity and Messianic interpretation of Isaiah, Bampton lectures for 1865; and commentary on Jeremiah. D. 1895.

SMITH, SAMUEL, 1752-1839, b. Carlisle, Penn.; son of John Smith, a resident of Baltimore, 1759, who was member of the legislature and chairman of the committee of ways and means in the revolutionary war. Samuel was educated at Carlisle, Baltimore, and Elkton; entered his father's counting-room; and visited Europe, 1771; capt. in Smallwood's regiment, 1776; performed effective service on Long Island. He distinguished himself at Harlem and White Plains; lieut.-col. of the 4th Md. regiment, 1777; defended Fort Mifflin, and received a sword and the thanks of congress. He was at Valley Forge and at Monmouth. He was a member of the state legislature, and member of congress, 1793-1833; for a short time secretary of the navy under President Jefferson. In the war of 1812 he was maj.-gen. of the state militia, and active in the defense of Baltimore; mayor of Baltimore, 1835.

SMITH, SAMUEL FRANCIS, D.D., b. Boston 1808, graduated at Harvard College in 1829; studied theology at Andover, pastor of a Baptist church at Waterville, Me., and professor of modern languages in Waterville College, 1834-42; pastor at Newton, Mass.,

1842-54. He has published *Life of Rev. Joseph Grafton*. He edited the *Baptist Missionary Magazine* and *Christian Review*. He is the author of "My Country, 'tis of Thee," and other favorite hymns.

SMITH, SAMUEL STANHOPE, D.D., LL.D., 1750-1819; b. Penn.; was a pupil and teacher in his father's classical academy, where he also studied theology; tutor in the college of New Jersey, 1770-73; ordained and preached in Virginia, 1774; was the first president of Hampden-Sidney college, 1775-79; appointed professor of moral philosophy in the college of New Jersey, 1779, and of theology, 1783; vice-president, 1786, and president, 1795-1812. He was an eloquent preacher and of distinguished personal appearance and manners. Among his published writings are, *Lectures on the Evidences of Christianity and on Moral Philosophy*; *System of Natural and Revealed Religion*, and many separate sermons and lectures.

SMITH, SEBA, 1792-1868; b. Me.; educated at Bowdoin college. After editing at Portland the *Eastern Argus*, and the *Courier*, he removed to New York in 1842. His *Life and Letters of Major Jack Downing* (1833), a series of humorous letters on political subjects, was exceedingly popular. Among his works was *Way Down East* (1854).

SMITH, Rev. SYDNEY, a celebrated wit and humorist, and the original projector of the *Edinburgh Review*, was born at Woodford, in Essex, in 1771. His father was an eccentric English gentleman of moderate independence; his mother was the granddaughter of a French refugee; and Sydney, it was said, fairly represented both nations. He was educated at Winchester school, and New college, Oxford, and, having entered the church, became curate of Amesbury in Wiltshire. "The squire of the parish," he says, "took a fancy to me, and requested me to go with his son to reside at the university of Weimar; before we got there, Germany became the seat of war, and in stress of politics we put into Edinburgh, where I remained five years." During this time he officiated in the Episcopal chapel there, and published *Six Sermons* (1800). In conjunction with a few accomplished literary associates—Jeffrey, Horner, Brougham, Dr. Thomas Brown, Playfair, etc.—Smith started the *Edinburgh Review*, the first number of which appeared in Oct., 1802, constituting a new era in the history of periodical literature, and of independent thought and criticism in Gt. Britain. In 1803 Smith removed to London, and was soon popular as a preacher, as a lecturer on moral philosophy (1804-6), and as a brilliant conversationalist, the delight and wonder of society. Church preferment, however, came slowly. In 1806, during the short reign of the whigs, he obtained from lord Erskine, chancellor, the rectory of Foston-le-Clay, in Yorkshire; some eighteen years afterward the duke of Devonshire gave him the living of Londesborough, worth £700 per annum, to hold until Mr. Howard, son of the earl of Carlisle, came of age. In 1828 lord chancellor Lyndhurst presented him to a prebendal stall in Bristol, and enabled him to exchange Foston for Combe Florey, a more desirable rectory in Somersetshire. In 1831 earl Grey appointed him one of the canons residentiary of St. Paul's; and this completed his round of ecclesiastical preferments. He sighed for a miter, but it never came; and lord Melbourne is said to have regretted this omission in his career as prime minister. The writings of Smith subsequent to 1800 were his contributions to the *Edinburgh Review*, which he collected and republished, with other miscellaneous works, in 1839; *Peter Plymley's Letters*, written in 1807, to promote the cause of Catholic emancipation, and abounding in wit and irony worthy of Swift; *Sermons* in two volumes (1809); *Speeches on the Catholic Claims and Reform Bill* (1825-31); *Three Letters to Archdeacon Singleton on the Ecclesiastical Commission* (1837-39); *The Ballot*, a political pamphlet (1837); *Letter to Lord John Russell on the Church Bills* (1838); *Letters on Railways* (1842); *Letters on American Debts* (1843); etc. Though gay, exuberant, and witty to the last, Smith suffered from periodical attacks of gout and other complaints, and he died on Feb. 22, 1845. Ten years afterward, his daughter, wife of sir Henry Holland, physician, published a memoir of her father, with a selection from his letters.

The works of Smith were mostly written on temporary topics and controversies, yet they bid fair to take a permanent place in our literature as specimens of clear and vigorous reasoning, rich unctuous humor, and solid good sense. His jokes, exaggeration, and ridicule are all logical, driving home his argument; and his wit was sportive, untinctured with malice. His views on political and social questions were moderate, wise, and practical; and he lived to see most of them realized.

SMITH, WILLIAM, D.D., 1727-1803; b. Scotland; graduated at the university of Aberdeen in 1747; came to America in 1750; had charge of a college in Philadelphia, 1751-52; returning to England was ordained in the church of England in 1753; was inaugurated in 1754 provost of the university of Pennsylvania. His works were edited by bishop White in 8 vols.

SMITH, WILLIAM, 1769-1839; b. England; began life as a land-surveyor, became interested in the study of geology, made a careful examination into the geological strata of many parts of England, and collected a valuable museum of fossil remains, and prepared notes which have been published comparing the identity of formations where similar fossils were found. He made important geological discoveries for which he received the Wollaston medal from the geological society, 1831. He was a popular

lecturer, and in 1828-34, took charge of the model farm of Sir John V. B. Johnstone in Yorkshire. In 1838 he was commissioned to select the stone for the new parliament buildings, and subsequently received a government pension of £100. He pub. a treatise on *Irrigation*, 1806, *Mineral Survey or Delineations of the Strata of England and Wales*, 1815, and other works; and also issued, 1819-24, 21 colored geological maps of English counties.

SMITH, SIR WILLIAM, LL.D., b. London, 1813; graduated at the university of London, having won the first prizes in Latin and Greek; professor of Greek, Latin, and German, in Highbury and Homerton colleges (independent) and of the Greek and Latin languages and literature in New college, consolidated from the former two; classical examiner in university of London, 1853; and editor of *Quarterly Review*, 1867. He has published many approved classical school-books, an English-Latin dictionary, a Biblical and classical atlas, and a series of student's histories in which he was assisted by his brother Philip. His dictionaries of classical antiquities, biography, and mythology, of the Bible, and of Christian antiquities, have great value, and have attained a large circulation in England and the United States. He was knighted in 1892, and died 1893.

SMITH, WILLIAM FARRAR, b. St. Albans, Vt., 1824; otherwise known as "Baldy"; graduate of West Point, 1845; rose through successive grades to maj., 1863; assistant prof. of mathematics at West Point 1846-48 and 1855-56. He was assigned to the survey of the Lake Superior region, Texas, and California, and was placed on the commission to decide the Mexican boundary line. At the beginning of the civil war he was sec. of the light-house board, at Washington. He took command of the 3d Vt. vols., 1861, and was engaged in the first battle of Bull Run, on the Chickahominy, at South Mountain, Antietam, and Fredericksburg, in the latter commanding the 6th army corps. He was chief engineer of the department of the Cumberland, of the Mississippi, at Chattanooga, and Missionary Ridge. He commanded the 18th corps, army of the Potomac, 1864, and was present at Cold Harbor, and Petersburg; pres. International telegraph company 1864; brevetted col. for White Oak Swamp and Antietam; and maj. gen. for Chattanooga and gallant service throughout the war. Resigned, 1867, and for a time was on the police board of New York city. Retired from the Army 1889.

SMITH, WILLIAM HENRY, b. London, 1825; son of a well-known bookseller, publisher, and news-agent. He was educated at the grammar school, Tavestock, and in due course became partner in his father's firm. In 1863 he was returned to parliament from Westminster as a Conservative, defeating John Stuart Mill, and retained his seat continuously until his death. He was financial sec. of the treasury, 1874-77, first lord of the admiralty, 1877-80, and in 1885 was appointed sec. for war. In Gilbert's *H. M. S. Pinafore* he is burlesqued under the title of Sir Joseph Porter, K.C.B. In 1887 he was appointed first lord of the treasury, and subsequently acted as the Conservative leader of the House of Commons. In 1891 he was made Lord Warden of the Cinque Ports, and died in the same year, Oct. 6th.

SMITH, WILLIAM ROBERTSON, b. Scotland about 1846; graduated at the university of Aberdeen, and continued his studies at Bonn, Göttingen, and Berlin; was appointed assistant professor in the University of Edinburgh; and afterward Professor of Oriental Languages and Old Testament exegesis in the Free Church College at Aberdeen. When his article on "The Bible," in the new edition of the *Encyclopædia Britannica* appeared, it excited suspicions of heresy, which in 1876 led to charges against him in the Presbytery of Aberdeen, which referred the case to the General Assembly. The Assembly directed the Presbytery to go on with the trial, and the Presbytery referred the matter again to the Assembly. Professor Smith having at length been suspended from his professorship and restored by the Assembly, was, on the appearance of an additional article in the *Encyclopædia*, suspended again by the commission of the General Assembly, and the case again came before the Assembly of 1881. He was removed from the professorship of Hebrew in the Free Church Coll., Aberdeen, by an extraordinary act of the General Assembly; and after that was associated with Prof. Baynes in editing the *Encyclopædia Britannica*. In 1883 he was appointed Prof. of Arabic in the Univ. of Cambridge. He has published *The Old Testament in the Jewish Church*, 1880; *The Prophets of Israel*, and *their Place in History to the Close of the Eighth Century B.C.*, 1882; etc. Died 1894.

SMITH, WILLIAM STEPHENS, 1755-1816; b. N. Y.; educated at the college of New Jersey. He was aid-de-camp of Sullivan, Steuben, and Washington, successively; secretary of legation in London in 1785, to John Adams, whose daughter he married; surveyor of New York: a member of the assembly of that state, and of congress.

SMITH COLLEGE, at Northampton, Mass., for the education of women exclusively, was founded in 1875 by the munificence of Miss Sophia Smith of Hatfield, Mass. Its endowment amounts to \$600,000, and it has admirable buildings, valued at \$650,000. It has an ample and beautiful site in one of the most charming villages in the valley of the Connecticut. Its high standard of admission and its curriculum place it among colleges of the first rank. It had (1897) 60 professors and teachers, and 932 students. L. Clark Seelye, D.D., LL.D., president.

SMITHFIELD. This name has become so celebrated, in connection with a cattle-market in London that it has been applied to similar establishments elsewhere. Smithfield, in the 12th c., was an open spot which served the citizens as a playground and a place for a stroll. Being a little n. of Newgate, and w. of Aldersgate, it was outside the city walls. It was in Smithfield that the rebel Wat Tyler met his death in 1381. Several noted tournaments were held here; and the place is associated with trials by battle,

the burnings of martyrs, public executions during many centuries, and a variety of incidents connected with the history of the metropolis.

The most celebrated fair in England, Bartholomew fair (q.v.), was always held in Smithfield.

A cattle-market was held in Smithfield at least seven centuries ago, for Fitzstephen has mentioned it in 1150. The corporation had official control over the market for more than 500 years, dating from 1345; and the city authorities have never to this day relaxed their hold over the one only live-cattle market in the metropolis. At one time there was a project for removing the market to a field near Sadlers' Wells, at another to a spot near the n. end of Gray's Inn lane; while a spirited projector spent £100,000 in building a new market at Islington; but powerful influences prevented the removal of the cattle-market until 1855. The last market-day in the old spot was on June 11 in that year; after which the trade was transferred to the large and very complete establishment built by the corporation at Pentonville. For several years after this Smithfield was practically useless. In 1860, however, the corporation obtained an act for erecting market buildings on the site of Smithfield, and the first stone of a magnificent dead-meat market, from the designs of Mr. Horace Jones, the city architect, was laid in June, 1867. The building, which was formally opened in Nov., 1868, is 636 ft. long by 246 broad, is traversed by numerous avenues, and has about 200 shops for dealers in meat, which is partly country-killed. This arrangement has enabled the city authorities to abolish Newgate market, which had become a serious obstruction to city traffic. Under the market three railways, sunk deeply below the ground-level, traverse the area, one going eastward to Aldersgate and Finsbury, one southward to Ludgate and Blackfriars, and one north-westward to King's Cross and the n. of London. Near the middle of Smithfield is a circular spiral road descending to an underground railway goods-station. The remainder is laid out in well-paved carriage and foot ways, with a small ornamental green or garden, including paths, seats, and a drinking-fountain. There is also a new market for poultry, butter, cheese, pork, etc., distinct from the meat-market. The extensive new works and alterations have greatly improved the appearance of Smithfield, and increased its salubrity.

SMITHSONIAN INSTITUTION, at Washington, district of Columbia, was organized by act of congress in 1846, in accordance with the will of James Smithson, who bequeathed the reversion of an estate amounting to \$515,169 to the United States, to be devoted to "the increase and diffusion of knowledge among men." He was an Englishman, a natural son of Hugh, third duke of Northumberland, and Mrs. Elizabeth Macie, a niece of Charles, duke of Somerset. He devoted his life to scientific pursuits, especially to chemistry, and died at Genoa in 1829.

The amount at first received from his bequest, \$515,000, was subsequently increased by the residuary estate to \$541,000, which was deposited in the treasury as a perpetual loan, the interest to be employed forever in promoting the object of the testator. By the plan adopted, the accumulations of interest were first employed in erecting a commodious and secure building of imposing architecture as the home of the institution. The board of regents is composed of the vice-president of the United States, the chief-justice of the supreme court; three senators, appointed by the vice-president; three representatives, appointed by the speaker of the house; and six citizens, appointed by joint resolution of congress, two of whom must be residents of the District of Columbia, and no two can be of any one state. The regents choose one of their number as chancellor, and appoint a secretary, who is director of the institution, chooses his own assistants and conducts the active operations. Besides the regents, the president and vice-president of the United States and the cabinet officers constitute the "establishment" styled the "Smithsonian Institution." When the trust was accepted, widely different ideas were entertained in congress and by distinguished men throughout the country concerning the methods by which the object of the testator could be best attained. One proposed a university of the highest possible grade; another an observatory to surpass all others on the globe; another the cultivation of seeds and plants for distribution, with printing-presses, and courses of lectures on physical and moral science, government, and public law; a third, an institution for experiment and research in physical science, especially pertaining to useful arts and the development of the natural resources of the country; and a fourth, an establishment for rearing sheep, horses, and silkworms, with a great library attached. The first secretary, the eminent Joseph Henry, at the time of his appointment professor in Princeton college, in entering on his office, drew up for the regents a scheme for the operation of the institution which they cordially adopted and have since maintained. Its leading principles are that, as the testator's design was to increase and diffuse knowledge *among mankind*, the institution should spend its labor and resources on no object merely local, or even national; and should not devote its energies to anything which could be done as well by any existing organization. In accordance with these principles, in the progress of the institution, its library has been incorporated with the library of congress; its meteorological observations to the U. S. signal service, of which they were taken as the foundation; and the national museum, deposited by law in the Smithsonian building, from the beginning was partly, and is now entirely, supported by the government. Having originated and developed these branches of scientific pursuit, the institution devotes its energies and means: I. To the INCREASE

of human knowledge. To promote this object it issues three series of publications: 1. *Contributions to knowledge*. These are memoirs pertaining to every branch of physical science, and contain positive additions to knowledge, based on original research, but excluding everything resting on an unverified hypothesis. 2. *Miscellaneous collections*, consisting of monographs designed to facilitate the study of natural history, chemistry, bibliography, etc. Papers presented for publication in either the first or second series are submitted to competent committees for examination, first, as to their being real additions to the existing knowledge of the subjects to which they pertain; second, whether as such they are worthy of publication by the institution. No restriction is made in favor of any particular branch of knowledge. The design is to stimulate men who have talents for original investigation to make researches, by offering to publish to the world an account of their discoveries, and to aid them in defraying the necessary expenses. Beyond this, apart from presenting to the author a few copies of his contribution, no remuneration is made; the publication under such favorable auspices, combined with the association of the author's name with Smithson's, being considered and accepted as a sufficient honorarium. 3. *Annual reports*, containing a statement to congress of the operations of the institution; with an appendix of translations from foreign books, biographies of distinguished scientists, ethnological and meteorological essays, correspondence, and accounts of unusual phenomena. II. The diffusion of knowledge is specially promoted by a system, early commenced and sedulously prosecuted, for the interchange of American and foreign scientific thought and achievement. This system has now attained great proportions. It brings nations, societies, and individuals into close communion. Through it the publications of the national government, as well as those of the institution, are exchanged. It is now familiarly known as the Smithsonian system of international exchanges, and is the medium for the exchange of scientific and literary materials between the United States and other nations. By means of it thousands of works, embracing the details of the latest inventions and discoveries, are brought to America; while, in turn, a knowledge is diffused abroad of whatever is done in the United States to advance, by the increase of knowledge, the welfare of men. There are now about 10,000 foreign societies in correspondence with the institution, besides many individuals, all freely sharing the benefits of the arrangement. The packages of exchanges are transmitted by the principal transportation companies of Christendom either without charge or at reduced rates, and are passed through all custom-houses free of duty.

In 1879 an appropriation was made by congress of \$250,000 for the erection, on the Smithsonian grounds, of a building for the national museum, which is under the charge of the institution, but has outgrown the accommodations possible in its one edifice. The Smithsonian fund, at interest in the U. S. treasury, amounted (1897) to \$912,000. The distinguished services of Prof. Henry, as the first secretary and director, extended from 1846 to his death in 1878; Prof. Spencer F. Baird, who from 1850 had been his chosen assistant, was secretary until his death, 1887, when Prof. S. P. Langley became secretary.

SMITH RIVER, a magisterial dist., Patrick co., Va. Pop. '90, 4563.

SMOKELESS POWDER. In the past thirty years the progress which has been made in the regulation of the explosive force of gunpowder, so as to adapt it to the safe development of very high energy in guns presenting great differences in regard to size, and the work which they have to perform, has been most important. The different forms of gunpowder which were applied to war purposes in this and other countries until within the last few years, presented comparatively few differences in composition and methods of manufacture from each other and from the gunpowder of our ancestors. The increased powder charges, and the necessity of a slower burning powder, necessitated important changes, and the very general adoption of machine guns and rapid-fire artillery, made it desirable to provide a powder for them that would produce comparatively little or no smoke, as their efficient employment becomes greatly limited when, after a very few rounds rapidly fired with black powder, the objects against which it is desired to direct the fire are more or less completely hidden by the interposed smoke. Hence, much attention has of late been directed to the production of smokeless, or nearly smokeless, powders for naval and military use. The properties of ammonium-nitrate, of which the products of decomposition by heat are, in addition to water vapor, entirely gaseous, have rendered it a tempting material to those who have striven to produce a smokeless powder; but its deliquescent character has been a formidable obstacle to its application as a component of a useful explosive agent. By incorporating charcoal and saltpetre in particular proportions with ammonium-nitrate, F. Gaus claims to have produced an explosive material free from the hygroscopic character common to other ammonium-nitrate mixtures, and furnishing only permanently gaseous and volatile, or smokeless, products of explosion.

The anticipations were not realized, but they led the talented German powder-maker, Mr. Heideman, to produce an ammonium-nitrate powder possessing remarkable ballistic properties, and producing comparatively little smoke, which speedily disperses. It yields a very much larger volume of gas and water-vapor than either black or brown powder, and is considerably slower in action than the latter; the charge

required to produce equal ballistic results is less, while the chamber-pressure developed is lower, and the pressures along the chase of the gun are higher than with brown powder. No great tendency is exhibited by it to absorb moisture from an ordinarily dry, or even somewhat moist, atmosphere, but it rapidly absorbs water when the hygroscopic condition of the air approaches saturation, and this greatly restricts its use. About five years ago reports began to reach us from France of the attainment of remarkable results with a smokeless powder employed with small arms, and to which the name *Mélinite* (which see) was given. Changes of greater or less degree have taken place since the first reports, and the material at present in use as *Mélinite* belongs to the nitro-cellulose or nitro-gun-cotton preparations. A comparison between the chemical changes attending the burning or explosion of gunpowder, and of the class of nitro-compounds represented by gun-cotton, at once explains the cause of the production of smoke by the former, and of the smokelessness of the latter. Whilst the products of explosion of the nitro-compounds consist exclusively of gases and of water-vapor, gunpowder, being composed of a large proportion of saltpetre, or other metallic nitrate, mixed with charred vegetable matter, and variable quantities of sulphur, furnishes products of which over 50 per cent. are not gaseous, even at high temperatures, and which are in part deposited as a fused solid—which constitutes the fouling in a fire-arm—and in part distributed in an extremely fine state of division through the gases and vapors developed by the explosion, thus giving to these the appearance of smoke as they escape into the air. So far as smokelessness is concerned, no material can surpass *gun-cotton* (or other varieties of nitro-cellulose); but even if the rate of combustion of the fibrous explosive in a fire-arm could be controlled with certainty and uniformity, its application as a safe propulsive agent is attended by so many difficulties that the non-success of the numerous early attempts to apply it to that purpose are not surprising. Those attempts commencing soon after the discovery of gun-cotton in 1846, and continued many years later in Austria, consisted entirely in varying the density and mechanical condition of employment of the gun-cotton fibre. No difficulty was experienced in thus exercising complete control over the rapidity of burning in the open air; but when the material was strongly confined, as in the chamber of a gun, such methods of regulating its explosive force were quite unreliable, as some slight unforeseen variation in its compactness or in the amount and disposition of the air-spaces in the mass, would develop very violent action. Much more promising results were subsequently obtained by Sir Frederick Abel by reducing the fibre to a pulp as in the ordinary process of making paper, and converting this into highly compressed homogeneous masses of the desired form and size. This method, improved upon and somewhat modified, is employed at the gun-cotton factory at the United States Torpedo Station. Although comparatively small charges of gun-cotton have often given high velocities without injuring the gun from which they were fired, the uniform fulfillment of the conditions essential to safety have proved to be beyond absolute control, even in guns of small calibre; consequently, before military authorities became fully alive to the advantages that accrue from the employment of an entirely smokeless explosive in artillery, experiments were discontinued for a time.

In sporting pieces considerable success attended the production of gun-cotton cartridges, the rapidity of its explosion being controlled by various methods. In some cases a lightly-compressed pulped gun-cotton charge of pellet-form was used, the uniform action of which was secured by simple means. Colonel Shultze, of the Prussian Artillery, produced a nearly smokeless sporting powder from finely divided wood, converted after purification into a mildly explosive form of nitro-cellulose, and impregnated with a small portion of an oxidizing agent. Subsequently this powder was produced in a granular form, and rendered considerably more uniform in character, and less hygroscopic, bearing a close resemblance to sporting powder made of nitro-cotton reduced to a pulp, incorporated with the nitrates of potassium and barium, and converted into grains through the agency of a solvent and a binding material. Both these powders produce very little smoke compared with black powder, but do not compete with the latter in regard to accuracy of shooting when used in military arms. In past years both camphor and liquid solvents have been applied to the hardening of the surfaces of granulated or compressed masses of gun-cotton and of this class of its preparations with a view to render them non-porous. In some foreign smokeless powders acetic ether and acetone have been also used, not merely to harden the granules or tablets of the explosive, but also to convert the nitro-cellulose, in the first instance, into a more or less gelatinous condition, so that it can readily be incorporated with other components, and rolled or spread into sheets, or pressed into molds, or squirted into wires, rods, or tubes while still in a plastic state. When the solvent has afterwards been removed, the hardened, horn-like, or somewhat plastic product is cut up into tablets, or into strips or pieces of suitable dimensions for conversion into charges or cartridges. Another class of smokeless powder, similar in physical characteristics to these nitro-cellulose powders, but containing nitro-glycerine as an important component, was originated by Mr. Alfred Nobel, the inventor of dynamite, and bears resemblance in its physical characteristics to blasting-gelatin, one of the most interesting of known violent explosive agents. When one of the lower products of nitration of cellulose is impregnated with the liquid explosive, nitro-glycerine, it gradually loses its fibrous nature, becoming gelatinized

while assimilating the liquid ; and the resulting product almost possesses the characters of a compound. This preparation, and certain modifications of it, have acquired high importance as blasting-agents more powerful than dynamite, and are possessed of the valuable property that their prolonged immersion in water does not separate from them any appreciable proportion of nitro-glycerine. The nitro-glycerine powder first produced by Nobel was almost perfectly smokeless, and developed very high energy, accompanied by moderate pressures at the seat of the charge, but it possessed certain practical defects which led to the development of several modifications of that explosive, and various improvements in manufacture. The relative merits of this class of smokeless powder and of various kinds of nitro-cellulose powder, are now under careful investigation, and several more or less formidable difficulties have been met with in their application, in small arms especially ; these arise in part from the comparatively great heat they develop, which increases the erosive effects of the products of explosion, and in part from the more or less complete absence of solid products. The surfaces of the barrel and of the projectile being left clean after the firing, are in a condition favorable to their close adhesion while the bullet is propelled along the bore, with the consequent establishment of very greatly increased friction. The latter difficulty has been surmounted by more than one expedient, but always at the cost of absolute smokelessness. The importance of insuring that the powder shall not be liable to undergo chemical change detrimental to its efficiency or safety, when stored in different localities where it may be subject to considerable variations of temperature, necessitates qualities not very easily secured in an explosive agent consisting mainly of the comparatively sensitive nitro-compounds to which the chemist is limited in the production of a smokeless powder. The extensive use of smokeless, or nearly smokeless, powder in one or two special military displays is considered as indicating a change that will necessarily take place in the conditions under which engagements on land will be fought in the future, provided these new explosives thoroughly establish and maintain their position as safe and reliable propelling agents. The powder is not absolutely smokeless, but the transparent film of smoke produced by independent rifle-firing is not visible at a greater distance than 300 yards ; at shorter distances it resembles the puff of a cigar. The most rapid salvo-firing by a large number of men does not have the effect of obscuring them from distant observers. The practical difficulties attending the utilization of the high velocities made possible by the newer style of powder have been found so very formidable that comparatively narrow limits at present restrict the powers of taking advantage of the increased ballistics that they present. It has been found that the strength of the gun carriages and the character of the arrangements used for absorbing the force of the recoil of the gun, need considerable modifications, not easy of application in some instances. Greater strength and perfection of manufacture are deemed imperative in the case of the hollow projectiles or shells to be used with charges of a propelling agent by the firing of which in the gun they may be submitted to comparatively very severe concussions. The increased friction to which portions of the explosive contents of the shell are exposed by the more violent setting back of the mass, are found to increase the possibility of their accidental ignition before the shell has been projected from the gun. A difficulty is also presented by the increased velocity of the shell in the matter of the rate of burning of the time fuse. Austria, England, France, Germany, Italy, Japan, Switzerland, are all experimenting with smokeless powders. One of the principal objects sought is to render detonation impossible by chemical and mechanical means, and to make use of a slowing agent which would give high and constant velocities with low and regular pressures. There must also be a freedom from noxious or irrespirable gases.

BALLISTITE, as the Nobel powder is called, has been definitely adopted by the Italian government. During the past year the military authorities of that country have ordered a quantity sufficient for 160,000,000 small-arm cartridges ; and they are experimenting with it in high-power guns with satisfactory results.

POUDRE B. (*Vieille Powder*) is the invention of Vieille, a Frenchman, and is the smokeless powder at present used in the Lebel rifle. Its composition is a secret jealously guarded by the French authorities. It is claimed that it gives a high muzzle velocity with only a slight recoil, and with but little strain on the breech mechanism. A French powder, known as BN., and supposed to be a modification of Poudre B., has given a muzzle velocity of 2540 feet a second from a 29.45 inch, 36 calibre, high-power gun, and of 2749 feet a second from a 5.9 inch Canet rapid-fire gun. As put up in cartridges the BN. is cut up into strips of about one-quarter inch thickness, which are laid side by side, and packed in canvas bags for high-power guns, and in metallic cases for rapid-fire guns.

CHILWORTH SPECIAL, is the powder which has until lately been used in the Armstrong guns, the smoke being nearly transparent and soon dissipated. In firing with it to leeward the target is not obscured for more than an instant of time. The Chilworth Special cartridges are put up in hermetically sealed metallic cases containing a cylindrical space through the middle, in which is placed a bag containing one pound of rifle large grain powder. It leaves no residue in the bore to interfere with the essential requirements of rapid loading.

CORDITE takes its name from the form in which it is made up. It is supposed to be

composed of ordinary blasting gelatine with soluble nitro-cellulose added, and with a solvent sufficient to give it the consistency of a moderately thick jelly. This is pressed through holes to form cords, which at first are soft and pliable, but which become toughened after the evaporation of the solvent. Then these cords, which are either of a circular or square cross section, are cut the necessary lengths, and packed side by side in cartridge cases. The rate of burning depends on the thickness of the cord. It is of a chocolate-brown color on the outside, and when broken shows a light gray section much like fine-grained pumice-stone. When burned in the open air in small quantities, it burns noiselessly and with moderate quickness, and gives off a bright yellow flame. It leaves no residue when fired, and gives off a slight filmy vapor which disappears very quickly. It is claimed that higher velocities and lower pressures have been obtained with charges but half the weight of those of ordinary gunpowder. Sir William Armstrong has asserted that in the 6-inch rapid-fire gun, a velocity of 2300 feet a second has been obtained from this powder with a pressure somewhat over 12 tons. It has been exposed to a very high and to a very low temperature without being injuriously affected.

GELBITE is a smokeless powder invented by Dr. L. H. Emmens, the inventor of Emmensite (see EXPLOSIVES of HIGH POWER) and is obtained by treating specially prepared paper with emmensite. It is in the form of thick yellow paper, which, but for the pronounced yellow of its color, corresponds to what has already been said of Poudre B. In trials at the navy-yard, Washington, from revolvers and rifles, this powder gave off but a slight dusty puff, which was very quickly dissipated, and which was accompanied by a sharp, quick report.

GRÄKRUT (Gray Powder) is a Swedish powder, the invention of a Mr. Skoglund. It was tested during the year from a 25 millimetre gun in comparison with the Belgian Wetteren powder, with the following results: With a charge of the Grakrut equal to 70 per cent. of the other powder, the initial velocity was increased 33 per cent., and the chamber pressure 5 per cent. With the charge of Grakrut decreased to 62 per cent. the initial velocity was increased 24 per cent. without any appreciable increase of chamber pressure. In competitive tests from Nordenfeldt guns the smoke from ordinary powder was not dissipated for twenty-five seconds, while that from the Grakrut was in the form of a transparent vapor, remaining visible only five seconds. Hengst powder is prepared from straw—preferably old straw—made into a pulp and treated with a mixture of two parts by weight of sulphuric acid to one of nitric acid for from fifteen to twenty hours, after which the acid is strained off and the pulp washed in water until no trace of acid remains. The mass is then steeped in a solution of hyposulphite of soda or other suitable alkaline solution, and then slowly dried. When dry it is compressed and then formed into grains or any other desired shape. In competitive trials with ordinary black powder it has given increased velocities with smaller charges; it gave off but little smoke, and that only a light vapor which rapidly condensed and immediately afterwards disappeared; it left but little residue. Several rounds fired in rapid succession did no more than slightly warm the barrel, while an equal number fired with the ordinary black powder heated it considerably. In the dark it gave out a faint pale blue glow at each discharge. Colonel Shakespeare, of the British army, made the following interesting experiments with this powder: He soaked two ounces in water for forty-eight hours and then dried it; when fired it was found to have been uninjured. He then steamed two ounces for twenty minutes on a copper-wire gauze, and alongside of it treated an equal quantity of black powder in the same manner; without drying he fired them. The Hengst powder exploded, but rather slowly, while the black powder only fused. Other experiments have proved this powder to be free from danger of explosion from friction or concussion, and it is considered to possess weight for weight, about 150 per cent. greater strength than ordinary gunpowder.

SCHWAB'S SMOKELESS POWDER was invented by Major Schwab, of the Austrian army, is of a gray-black color, and has a very large grain, larger than is found with ordinary powders. It burns slowly in the open air, gives off a vapor like attenuated steam, and emits a slight odor very similar to that of ordinary powder. When made up into cartridges it ignites rapidly and gives much higher velocities, with lower pressures, than ordinary powder. In one experiment from a field piece this was the case, with a charge only 50 per cent. of that of ordinary powder. Continuous volley firing resulted in a transparent vapor that in no way impeded a constant view of the object which was being fired at. Samples of it have already been kept over four years without undergoing chemical change. For further information on explosives see GUN-POWDER, HIGH-EXPLOSIVES.

Some extensive and reliable experiments with smokeless powders were made in Germany, in August, 1890, the powder used being the composition of 1889, known as Cn-S9. The firing raised a feeble brown cloud, which was so thin that immediately after a discharge the next shot could be aimed, as the target continued distinctly visible. Even in heavy, rainy weather the brownish clouds dispersed in less than three seconds, whereas black powder, fired at the same time, collected in front of the gun a cloud of smoke which hung about a longer time and rendered a rapid fire impossible. The combustion left but little residue, and the heating of the gun and cartridge case was also sensibly less than with the black powder.

American wood powder is a mechanical mixture of cellulose, starch, sugar, bituminous coal, and charcoal thoroughly incorporated together and pulverized. It is formed into grains and treated with nitric and sulphuric acid, neutralized by repeated boilings in water and alkaline solutions. It is then dried, treated with a solution of saltpetre, again dried, when it is ready for use. It was the method of controlling the combustion that placed this powder among the safe explosives, and this was done by incorporating carbon with the nitro-cellulose. The greatest care is exercised in cleansing it from free acid by repeated washings. It deflagrates without explosion if not confined, but when confined in a gun-barrel it exerts a very powerful driving force.

Among the new explosives produced during 1895-96 are Cannonite, Fulgurite, Progressite, Americanite, and Schnebelite, the relative strength of which is given in the following table:—

NAME OF EXPLOSIVE.	Percentage of Strength.	NAME OF EXPLOSIVE.	Percentage of Strength.
Perunite B.....	100.0	Emmensite.....	66.0
Perunite C.....	91.0	French nitro-glycerine.....	63.0
Rosell's mixture.....	89.5	Dynamite No. 1.....	62.6
Perunite D.....	83.0	Cannonite.....	62.0
Americanite.....	82.0	Amide powder.....	59.0
Explosive gelatine.....	81.0	Progressite.....	58.5
Schnebelite.....	80.0	Tomite.....	57.0
Rack-a-rock.....	79.0	Bellite.....	56.0
Hellofite.....	78.0	Oxonite.....	54.4
Nitro-glycerine, best quality.....	73.0	Atlas powder, No. 1.....	54.0
Nobel's smokeless powder.....	70.0	Melinite.....	49.0
Explosive gelatine made from No. 5 nitro-glycerine.....	68.0	Silver fulminate.....	48.2
United States Navy gun-cotton.....	67.5	Mercury fulminate.....	47.5
Fulgurite.....	67.0	Rifle powder.....	35.0
		Mortar powder.....	30.0

SMOLENSK, a government of European Russia, bounded on the e. by the governments of Moscow and Kaluga. Area, 21,638 sq. miles. Pop. '93, 1,469,756.

SMOLENSK, a fortified t. of Russia, capital of the government of the same name, is picturesquely situated on a range of steep declivities overlooking the river Dnieper, 250 m. w.s.w. of Moscow. It is one of the oldest towns in the empire, having been a place of note in the 9th c., is surrounded by massive walls, and has cathedrals, churches, and several monasteries, a diocesan seminary, a gymnasium, a military school for nobles, hospitals, etc. Smolensk carries on manufactures of linens, soap, leather, and carpets, and a considerable export trade in corn and flax. Pop. '93, 41,429. Smolensk is historically notable as the scene of a bloody repulse of the Russians, under Barclay de Tolly and prince Bagration, by Napoleon, Aug. 17, 1812, when on his march for Moscow.

SMOLLETT, TOBIAS GEORGE, an eminent British novelist, b. in 1721, was descended from an old and distinguished family in Dumbartonshire. His grandfather, sir James Smollett of Bonhill, was one of the commissaries or consistorial judges of Edinburgh, and sat in the Scots parliament as representative of his native county. Had the novelist survived about four more years than the term of his too short life, he would, as heir of entail, have succeeded to the ancestral estate in the beautiful vale of Leven. He lost his father while very young; but he was well educated, and afterward apprenticed to a surgeon in Glasgow. He is said to have wished to enter the army, and being disappointed, to have avenged himself on his grandfather, who thwarted his inclinations, by describing sir James under the unamiable character of the old judge in *Roderick Random*. This is related by Scott and all the biographers, but it must be wrong; for sir James, the grandfather, died in 1731, when Tobias was only in his tenth year. The duty of attending to the education and settlement of the youth would naturally devolve on his widowed mother and on the laird of Bonhill, his cousin. It is certain, however, that Smollett inherited no fortune; and in his 18th year, he went to London with a tragedy which he had written on the assassination of James I. of Scotland, and which he trusted would lead to distinction, if not wealth. He was grievously disappointed, and was glad to accept the post of surgeon's-mate on board one of the ships in the unfortunate expedition to Carthagera, in 1741. He soon quitted the service in disgust, although not before he had seen enough of naval life and character to be of inestimable value to him as a novelist; and returning to London, he commenced, and for the remainder of his life followed, the profession of an author. He made, indeed, repeated attempts to obtain practice as a physician, and in 1750, got a diploma of M.D. from Aberdeen; but his hasty irritable temper and independent spirit, joined to his natural propensity to satire, were fatal to his hopes. Even his literary career was a ceaseless warfare. In 1748, in his 27th year, he produced his *Roderick Random*, which was read with the utmost avidity, and seemed at once to place its author very near, if not in the actual rank of Fielding as a novelist. In 1751 appeared *Peregrine Pickle*, a more ambitious and not less successful work, and in 1753, *Ferdinand Count Fathom*, an inferior production, though containing scenes of striking adventure and eloquent description. Smollett next translated *Don Quixote* (1755), in which, it is admitted, he was surpassed by Motteux and Jarvis. He then undertook the editorship of a new Tory journal, *The Critical Review*, which was the most unfortu-

nate of all his engagements, as it involved him in endless quarrels and personalities. For one article, an attack on admiral Knowles, he suffered three months' imprisonment, and was fined £100. In 1758 he published his *History of England*, 4 vols. quarto—a history from the descent of Julius Cæsar to the treaty of Aix-la-Chapelle in 1748, but which was begun and completed in 14 months, realizing for its author a sum of £2,000. Though superficial and inaccurate, this history has passages of fine animated writing and masterly delineation of character. We next find Smollett involved in political controversy with Wilkes and others, and defending lord Bute's administration; but he wanted tact and temper for work of this description, and reaped no laurels as a politician. Another novel appeared in 1760–61, *The Adventures of Sir Launcelot Greaves*; in 1766 two volumes of querulous *Travels in France and Italy*; in 1769 *The Adventures of an Atom*, a political satire unworthy of its author; and in 1771, only a few months before his death, *The Expedition of Humphry Clinker*, the best of all the novels of Smollett; and in the opinion of Thackeray, one of the very best in the whole range of imaginative literature. Worn out with literary cares, private misfortunes, anxiety, and ill-health, the novelist retired to Italy, and died at Leghorn, Oct. 21, 1771, in the 51st year of his age.

As a novelist, Smollett is distinguished by his broad humor and burlesque, the great variety of his incidents and characters, and the excellence of his easy, picturesque style of narrative. He is often careless, but rarely dull. He does not indulge in digressions, like Fielding, and though less of a literary artist than his great English rival, his works are read with more intense interest. He had, in fact, greater imagination and poetical sensibility. He added largely to our stock of original characters and humorists—*Strap*, *Tom Bowling*, *Morgan the Welshman*, *Lismahago*, and *Matthew Bramble* are still unsurpassed. Delicacy of taste was denied to both Fielding and Smollett, and perhaps the latter is the more gross and sensual of the two.

SMUGGLING is a violation of those laws regulating commerce which are enacted by the U. S. congress under the powers given them in that regard by the constitution, and is made a penal offense by the statutes of the general government. The main provisions of the present law (Rev. Stat., tit. xxxiv., chap. 10) are that the goods which are attempted to be introduced contrary to the tariff regulations or under false representations, shall be seized, and, on condemnation of the court, forfeited and sold, while the guilty party is liable to a fine of not more than \$5,000 and not less than \$50, and to imprisonment for not more than two years, or to both. Fines and penalties are also provided for officers of vessels conniving in smuggling or resisting the revenue officers. The procedure is in the U. S. district or circuit court, and is instituted by the district-attorney. After condemnation and sale, the proceeds minus costs and expenses are distributed, part going to the informer (if there were any such, distinct from the officers), part to the government, and part to the custom officers of the port or district. Very wide discretion and great powers are given, necessarily, to the officers employed in carrying out these laws. Their right of search extends four leagues from the coast. They may examine boxes, trunks, papers, letters, stores, warehouses, and all places where smuggled goods might be concealed. The person of a passenger is not exempt from search. Upon obtaining an order from the proper court, an officer may compel importing merchants, or others, to exhibit their books or bills of lading.

SMUT, the popular name of certain small fungi of the section *coniomycetes*, and group or family *uredineæ*, parasitical on plants, particularly on grasses, and notable for the great abundance of dark-colored spores which they throw off. The name smut, although somewhat variously used, is now very generally limited to the genus *ustilago*, in which the character just mentioned, of the profusion of dark-colored spores, is very remarkable. The name smut is often given to *ustilago segetum*, or *uredo segetum*, also called **DUST-BRAND**, a species very common and destructive, parasitic on wheat, barley, oats, and rye (see **ERGOT**), at the base of the germs and glumes, causing the death of the inner parts of the flower, and then converting the whole into a sooty dusty mass. At first, a fine mycelium alone is seen, which ere long produces spores. There is no disagreeable smell, as in some of the allied fungi. A remarkable kind of smut infests maize, swelling the ears to an enormous size, sometimes even a foot in length. No remedy or preventive is known for smut. It does not seem to be communicated through infected grains; but perennial plants attacked by fungi of this kind remain diseased.

SMYRNA, one of the most ancient and important cities of Asia Minor, and the only one of the Greek cities on the western coast which has retained its name and importance to the present day. The early history of Smyrna is very obscure: varying accounts represent it either as originally an Ionian colony, or as having been at first an Æolian city, which, by an act of treachery, fell into the hands of Colophonian (Ionian) exiles, and subsequently, about 700 B.C., formed part of the great Ionian league. This earliest city of Smyrna, known among the Greeks as "Old Smyrna," was situated on the banks of the little river Meles, on the n.e. side of the Hermæan gulf, now the gulf of Smyrna, and claimed the honor of being the birthplace of Homer; and here, near the source of the river, a grotto was shown, in which he was said to have composed his poems. This old city of Smyrna was destroyed, we are told, by the Lydian king Alyattes, and the place remained deserted and in ruins till after the Macedonian conquest,

when the city was rebuilt at the distance of between 2 and 3 m. s. of its original site. This city of "New Smyrna" was founded by Antigonos, and enlarged and embellished by Lysimachus; it was laid out with great magnificence, and adorned with several fine buildings, among which was the *Homereum*, where the poet was worshiped as a hero. The city had an excellent harbor; and from its admirable situation, soon became one of the finest and most flourishing in the world. In the early history of Christianity, Smyrna holds a distinguished place as one of the seven churches addressed in the Apocalypse, and as the scene of the labors and martyrdom of its first bishop, Polycarp. After various vicissitudes during the middle ages, it fell finally into the hands of the Turks, in whose possession it has since remained—the most flourishing city of the Levant.

The modern city of Smyrna (Turkish *Izmir*) occupies the site of New Smyrna, being built partly on the plain at the head of the gulf, partly on the declivity of a hill, the ancient Mons Pagus, and, from the sea, has an attractive appearance. There are some good quays, and some handsome buildings of stone; but the greater part consists of low wooden houses, for the most part of one story high; and the streets, with a few exceptions, are ill-paved, narrow, crooked, and dirty. The city, however, in these respects is better than most other Turkish towns, and improvements have of late years been made. The pop. is estimated at 225,000; of whom about one-half are Greeks, and the rest Turks, Jews, Armenians, and Franks. As is usual in Turkish towns, each people has its separate quarter. Smyrna contains several Greek, Armenian, Roman Catholic, and Protestant churches, and several mosques. There are six journals published here in five different languages. The harbor is excellent; ships of large burden anchor close to the quays; and the trade is most important and extensive. A railway, 81 m. long, constructed mainly with English capital and by English engineers, has been recently opened to Aidin, an important inland commercial town, and is now in operation. Another railway, extending 61 m. inland (to Cassaba), was finished in 1866, and afterward extended to Philadelphia (Alasher). The chief imports are woolen, cotton, and silk fabrics, the metals, leather, nails, machinery, earthenware, building stones, glass and hardware goods, coffee, sugar, spirits, etc. The exports consist of wool, cotton, silk, carpets, hides, opium, copper, wheat, rice, oil, drugs, and gums, figs, raisins, and many other articles. The city and its territory are governed by a pasha. Of the ancient cities not much remains. Some slight ruins mark the site of Old Smyrna. Of New Smyrna some remnants of the massive walls on the hill s.e. of the city are still to be seen.

SMYRNA, GULF OF, an inlet of the Ægean sea, on the w. coast of Asiatic Turkey, is so called from the city of Smyrna (q.v.), which stands at its head. It is 40 m. long, is about 20 m. in greatest breadth, and contains several islands.

SMYTH, a co. in s.w. Virginia; drained by the three forks of the Holston river; traversed by the Norfolk and Western railroad; about 450 sq. m.; pop. '90, 13,360, chiefly of American birth. The surface is mountainous and covered with forests, but the valleys are fertile; wheat, oats, cattle, and pork are the staples. Co. seat, Marion.

SMYTH, CHARLES PIAZZI, b. 1819, Naples; for some time employed in the observatory at the cape of Good Hope, and afterwards appointed royal astronomer of Scotland. He has long studied the great pyramid of Egypt, which, he maintains, was built by divine inspiration as a standard of weights and measures. He has advocated this peculiar theory in several books, such as *Our Inheritance in the Great Pyramid* (1864), *Life and Work at the Great Pyramid* (1867), and *Antiquity of Intellectual Man* (1868).

SMYTH, EGBERT COFFIN, D.D., b. Brunswick, Me., 1829; bro. of S. P. N. Smyth. He graduated at Bowdoin coll., 1848, and studied divinity in the seminaries at Bangor and Andover, and in the univ. of Berlin. Having entered the Congregational ministry, he was a prof. in Bowdoin Coll., 1854-63, when he became prof. of ecclesiastical history at Andover. Since 1878 he has been president of the Andover faculty. He has made large contributions to current denominational literature, and is editor of the *Andover Review*.

SMYTH, JOHN, 1552-1612, b. England; graduated from Christ's college, Cambridge, 1575; took orders and became a fellow, but joined the Puritans after receiving a rebuke for advocating a Judaic observance of Sunday. He went to Amsterdam in 1606, became a Baptist, and was engaged in controversies with Ainsworth and others. He wrote several theological and controversial treatises, such as *A True Description of the Visible Church; The Character of the Beast*, etc.

SMYTH, SAMUEL PHILLIPS N., b. Brunswick, Me., 1843; bro. of Prof. Egbert C., of Andover; educated at Bowdoin coll. and at Andover theol. sem. During the war he was first lieut. of the 16th Me. vols. He was ordained to the Cong. ministry, and was pastor of the First Cong. church, Bangor, Me., 1870-74; First Pres. church, Quincy, Ill., 1875-82; and has been pastor of the First Church of Christ (Cong.), New Haven, Conn., since 1882. Dr. S. is widely known as one of the chief exponents of the "new theology." His works include *The Religious Feeling; Old Faiths in New Lights; Orthodox Theology of To-day; The Reality of Faith; Christian Facts and Forces* (1887).

SMYTH, WILLIAM HENRY, 1788-1865; b. England; son of a loyalist of the American revolution, of New Jersey; descended from Capt. John Smith; entered the British navy, 1805; served at Cadiz, 1810. He made a hydrographical survey of the coasts of Sicily,

and published *Atlas and Descriptive Memoir on Sicily*, 1824; made a survey of the coasts of the Adriatic, 1817, and of the Mediterranean, 1821; post. capt., 1824; rear admiral, 1853. He owned an astronomical observatory at his residence in Bedford, and another at his place in Cardiff. He was president of the Royal astronomical society, and hydrographer to the admiralty.

SNAIL, *Helix*, a genus of gasteropodous mollusks of the family *helicidae*, having generally a sub-globose, sometimes a depressed, spiral shell; the mouth of the shell more or less encroached upon by the last whorl but one, strengthened with an internal thickened rib, its edges more or less reflexed; the *foot* of the animal long, and pointed behind; the tentacles four, the lower pair much smaller than the upper; the tongue armed with many—often from 100 to 200—longitudinal rows of teeth. The species are very numerous, more than 1400 having been described; besides fossil species, of which also there are many. Some of the groups have been constituted into separate genera by recent authors, but all retain the popular name snail, which is indeed often extended to all the *helicidae*. As an instance of the general distribution of snails, it may be noticed that *helix aspersa*, one of the common garden-snails of Britain, is found very generally throughout Europe, great part of Asia and the n. of Africa, and in South America.—Snails feed chiefly on vegetable substances, although they are very indiscriminate in their appetite, and even devour the dead of their own kind. The mischief which they do to garden-crops is too well known; and gardeners lay down cabbage-leaves and the like to attract them, in order that they may be destroyed; any greasy substance increasing the attractiveness of the bait.—Snails delight in warm moist weather; in dry weather their chief time of activity is during the night, and they hide themselves by day; but after rain they come forth at any hour in quest of food. At the approach of winter, or in very dry weather, they close the mouth of the shell with a membrane (*epiphragm*), formed by the drying of the mucous substance which they secrete, and become inactive and torpid. Some, as the edible snail (*H. pomatia*), make a succession of such membranes; the outer one of which is also strengthened by a quantity of calcareous matter, the secretion being at first a white viscid fluid, but quickly hardening like plaster of Paris. When this is to be removed, a fresh secretion of fluid mucus softens it at the edges. Snails retreat into crevices for the winter, or into holes which they make in the earth, and which are roofed over with earth, dead leaves, etc., agglutinated by secreted mucus.—Snails are hermaphrodite, but mutual impregnation takes place, and when they are about to copulate they excite each other by pricking or even piercing with a sharp, calcareous, glass-like style, affixed to a peculiar muscular sac which serves for its protrusion, and which is produced by recent secretion, not being found in them on dissection, except at the season of reproduction. Extraordinary as this circumstance is, it has been the subject of much exaggeration, and in works on natural history not of very old date we read of snails throwing darts (*spicula amoris*) at each other, all which appears to be merely fabulous, although it is probable that the calcareous style may be often broken off in its use. The eggs of snails are round, and enveloped in a skin; they are generally deposited in little clusters. The eggs of the common garden-snails of Britain are about the size of peas, and are deposited just under the surface of the soil.—Snails possess in a very high degree the power of repairing injuries, not only of the shell—although the removal of the whole shell is fatal to them—but also of the soft parts. When the tentacles are cut off, they grow again; and even if the head is cut off, a new head is produced.—We do not think it necessary to describe any of the common British species, as there is nothing of peculiar interest connected with any of them; and the rarer and smaller species have still less claim to notice. The **EDIBLE SNAIL** (*H. pomatia*) of the s. of Europe is the only one that deserves to be particularly mentioned. It is found in the chalk and oolite districts of the s. of England, where it is said to have been introduced from the continent in the 17th c.; but this is very doubtful. It has a shell about 2 in. in diameter and 2 in. in height, whitish or pale tawny, with four darker bands, often not very distinct. It was much esteemed as an article of food by the ancient Romans, who fattened their snails in inclosures (*cochlearia*) made for the purpose, feeding them delicately on meal and boiled wine. It is still in much esteem for the table in various parts of Europe, and is occasionally used in England. Nor is it the only species so used; the common garden-snails are probably equally good, although not so large, and “the glassmen at Newcastle once a year have a snail-feast; they generally collect the snails in the fields and hedges.” Snails of different species are also an article of exportation on a small scale from England to the United States, packed in old casks, in which they are conveyed very well, fixing themselves one upon another to the cask, and leaving a vacant space in the center. Snails boiled in milk are popularly regarded as a remedy for diseases of the chest, and for this purpose they are brought to Covent Garden market. If any benefit results from the use of them, it is probably due to their nutritious qualities.—Some of the tropical species of *helix* are very large, and some have very beautiful shells. See *illus.*, *MOLLUSKS*, vol. X.

SNAKE, a term synonymous with serpent.—The name **COMMON SNAKE** is very generally given in England to a species very abundant in most parts of that country, and throughout Europe from the s. of Scandinavia to the Mediterranean, although there is

only one doubtful instance of its having been found in Scotland. Its range extends also over great part of the n. of Asia. This species (*natrix torquata* or *tropidonotus natrix*) is also known as the RINGED SNAKE and the GRASS SNAKE. It belongs to the family *colubridæ*, and to a section of it which some naturalists constitute into the family *natrixidæ*. It grows to the length of 4 and even 5 ft., although specimens exceeding 3 ft. are rare. The female, as in serpents generally, is much larger than the male. The head is ovate, the muzzle rather narrow, the back part considerably broader than the neck; the body thickens toward the middle, and again tapers toward the tail, which is about one-fifth of the entire length, tapering to a rather sharp point; the gape is wide; the upper part of the head covered with large plates; the scales of the back have an elevated keel; those of the sides are larger, the keel merely rudimentary; the belly is covered with broad oblong plates; the under part of the tail has plates arranged in two rows. The teeth are very small, directed backward, and arranged in two rows on each side of the jaws. The upper parts are grayish brown, tinged with green; at the back of the head are two crescent-shaped bright yellow spots, forming a kind of ring or collar; immediately behind these are two broad black spots, sometimes confluent. Two rows of small black spots are arranged alternately down the back, and larger ones at the sides; but these vary much in size and other particulars. The belly is pale lead color, often marbled with black. The outer skin is changed at intervals varying according to the weather and other circumstances. Mr. Bell says: "I have known the skin shed four or five times during the year. It is always thrown off by reversing it; so that the transparent covering of the eyes, and that of the scales also, are always found concave in the exuvie. Previously to this curious circumstance taking place, the whole cuticle becomes somewhat opaque, the eyes are dim, and the animal is evidently blind. It also becomes more or less inactive, until at length, when the skin is ready to be removed, being everywhere detached, and the new skin perfectly hard underneath, the animal bursts it at the neck, and creeping through some dense herbage, or low brushwood, leaves it attached, and comes forth in far brighter and clearer colors than before." This snake is partial to damp situations, and often enters water, in which it swims with great ease, moving with singular gracefulness. It sometimes remains at the bottom for a considerable time. It sometimes climbs trees, its body, when ascending the stem, being "straight and rigid as a stick." See SERPENTS. It is very voracious; its food consists of frogs, small birds and quadrupeds, etc. Its teeth being incapable of tearing, cutting, or masticating food, the prey is always swallowed entire and living. Mr. Bell heard a frog emit a cry some minutes after it had been swallowed by a snake. The snake has no poison-fangs. It has another kind of defensive armor, in certain glands, which emit a volatile substance of most offensive and penetrating odor, which, like that of the skunk, can hardly be removed from the skin or clothes. No such odor is emitted except in moments of irritation or other passion. The common snake is oviparous: its eggs—usually about fifteen or twenty in number, whitish, with a parchment-like skin, and united into a string by a glutinous substance—are deposited in moist and warm situations, often in dunghills. The mother is said sometimes to coil herself around them, but generally leaves them unregarded. This snake is capable of being tamed, and becomes familiar with those who are kind to it, while the approach of a stranger, of a dog or cat, alarms it, and causes an emission of stench. In winter, it seeks some refuge from severe cold, and becomes lethargic or dormant. Large numbers of snakes often take refuge in one hole; but seldom so many as in an instance recorded by Dr. Carpenter, in which about 1300 were found in an old lime-kiln.

Much interest was excited in 1862 by the discovery in England of a species of snake, *coronella lavis* (see CORONELLA and SERPENTS), previously unobserved in Britain, but common in the middle and s. of Europe, and sometimes distinguished by the name of AUSTRIAN SNAKE, sometimes by that of SMOOTH SNAKE, none of the scales being ridged or keeled, as in the common snake. It inhabits much drier situations than those affected by the common snake, where it is often found in company with the sand lizard, situations more resembling those in which the viper is found. This snake is also more similar to the viper in form and appearance than the common snake, and these circumstances have probably led to its being often mistaken for the viper, and its existence in England remaining unnoticed so long. It attains a length of about 2 ft.; is of a shining brown color, ornamented with checkered irregular patches of black; a yellow mark on the back and sides of the head; the lower parts yellowish, with square black spots. The head is not flattened, as in the viper, but is narrowed in a similar way toward the neck; there is much difference in the plates of the head; the yellow mark on the head is a very characteristic distinction, and the back does not exhibit a broad zigzag pattern, as in the viper. Unlike the common snake, the *coronella lavis* is ovoviviparous, the eggs being hatched within the mother.

SNAKE-BIRD. See DARTER.

SNAKE-EEL, the popular name of the fishes forming the family *ophisuridæ* of some naturalists, included by others, with all the eels, in the family *muraenidæ*, and distinguished by the want of a tail-fin, and the tail ending in a conical point like that of a serpent. They are inhabitants of the seas of warm climates. One species, *ophisurus serpens*, is found in the Mediterranean. It attains the length of about 6 ft., and the

thickness of man's arm; is brown above, silvery beneath, and has a slender and pointed snout.

SNAKE RIVER, also called **LEWIS'S FORK**, is the great southern branch of the Columbia (q.v.). See **IDAHO**.

SNAKE-ROOT. See **ARISTOLOCHIA**; **POLYGALEÆ**.

SNAKE-STONES, small round pieces of stone or other hard substance, popularly believed to be efficacious in curing snake-bites. A belief in their efficacy has been long and very widely diffused, and probably extended to Britain and other western parts of the world from the east. Small perforated balls and rings of various kinds of stone, ivory, etc., strung together like beads, were formerly used as snake-stones in Scotland, being given to cattle to chew when they were bitten by vipers. Of course they could only be expected to act as a kind of charm. Many of the snake-stones used in India and the further east seem to be of no greater value. Some of them, however, appear to be really efficacious, being applied to the wound and absorbing blood from it with the poison before it has entered the system. Remarkable instances are related of speedy cures thus effected. The snake-stone adheres for a short time to the wound, and then falls off. The wounded limb is meanwhile rubbed downward. Two small snake-stones, each the size of a large pea, brought from India, and which were known to have cured a man bitten by a cobra, were found by Mr. Quekett to be composed of some vegetable matter. Another, also known to have cured a cobra's bite, having been brought from Ceylon by sir James E. Tennent, was examined by Mr. Faraday, and was deemed by him to be "a piece of charred bone, which has been filled with blood, perhaps several times, and then carefully charred again." —See Buckland's *Curiosities of Natural History*, and Tennent's *Ceylon*, vol. i.

SNAKE-WEED, another name of **Bistort** (q.v.).

SNAKE-WOOD, another name of **Letter-wood** (q.v.).

SNAPDRAGON, *Antirrhinum*, a genus of plants of the natural order *Scrophulariaceæ*, consisting of annual and perennial herbaceous plants, chiefly natives of the temperate parts of the northern hemisphere. They have the calyx 5-parted; the corolla swollen at the base, but without a spur, and *personate* (Lat. *persona*, a mask), i. e., its mouth closed by the pressure of the lower against the upper lip; and the fruit is a 2-celled oblique capsule, opening by three pores at the apex. The English name refers to a peculiarity of the corolla, the lower lip of which, if forcibly parted from the upper, so as to open the mouth, shuts with an elastic spring or snap. Some of the species have very pretty flowers. *A. majus* has long been a favorite in our gardens, in which there are many fine varieties of it.

SNAPHAUNCE, an old musket of the 17th and first half of the 18th c., called also **Asnaphan**. See **LOCK**.

SNAPPING-TURTLE, a name applied in the United States to different species of tortoises. The best known is the *chelydra serpentina*, of the northern, and most of the southern states, inhabiting small streams and marshes. It is said to sometimes attain a length of 4 feet, and to weigh 50 lbs. Its more common size is from 8 to 15 lbs. It has an immovable plastron, a large head, and is very fierce, snapping at its enemies, and its food. Another kind of snapping-turtle, known in the southern states, extending from Florida to western Texas, and up the Mississippi and Missouri rivers is the *macrolemys temminckii*, generally known as the alligator-turtle. It is said to sometimes attain a weight of 100 lbs. Both of these species belong to the family *chelydridæ*, and are distinguished from all other turtles of the United States by the long and imperfectly retractile neck and tail, and the cruciform plastron or lower shell. Both these turtles are used as food, and by some are highly prized for making soup; but they are inferior to the sea-turtle. The name of snapping-turtle is sometimes applied to soft-shelled turtles of the family *trionychidæ*, because they also snap at their food and other objects.

SNEE HÄTTEN. See **NORWAY**.

SNEEK, a prosperous trading and manufacturing t. in the Netherlands, province of Friesland, 13 m. s.s.w. of Leeuwarden. It is built in the form of an irregular triangle, has three canals, and good water-way to the sea. There are a number of manufactures of metal wares, bricks, etc., and a trade in wheat, butter, cattle, etc., and some shipping. Rich meadow-lands, in some places tending to be marshy, surround the town, and in the neighborhood is a considerable lake called the Sneekermeer. Pop. '89, 11,469.

SNEEUWBERGEN, a range of mountains in Cape Colony, South Africa, forming the eastern extension of the Roggeveld and Nieuveland ranges. See **CAPE OF GOOD HOPE**.

SNEEZE-WOOD, *Pteroxylon utile*, a tree of the natural order *sapindaceæ*, a native of South Africa, common in the eastern districts of Cape Colony. The timber rivals mahogany in beauty, takes a fine polish, is very solid, strong, and durable. It receives its English name, and its Dutch name, *nieshout*, from the sternutatory properties of its sawdust, by which workmen are often much annoyed.

SNELL, EBENEZER STRONG, LL.D., 1801-76; b. Mass., graduated at Amherst college, where he remained continuously an instructor for over 50 years, and since 1834 prof. of mathematics and natural philosophy. He edited several text-books.

SNELL, WILLEBRORD, 1591-1626; b. Leyden, son of Rudolph Snell, was professor of mathematics at the university at Leyden, succeeding his father, and the discoverer, according to Huygens and Vossius, of the law of the refraction of light attributed to Descartes. He was a friend of Kepler. He published (1617), *Eratosthenes Batarus sive de Terre Ambitus vera Quantitate*, describing his method of calculating the size of the earth, and *Cyclometria* (1621).

SNELL EXHIBITIONS. These exhibitions were founded in the year 1677 by John Snell of Uffeton, in the county of Warwick, for the purpose of educating Scottish students at the university of Oxford. Snell was born in the parish of Colmonell, in Ayrshire, in 1629, and entered the university of Glasgow in 1644. He afterward removed to England, where, after holding several offices of a legal nature, he was appointed seal-bearer to the court of chancery. He died at Holywell, near Oxford, in 1679, leaving his estate of Uffeton, near Leamington, to trustees (the vice-chancellor of the university of Oxford, the provost of Queen's college, the master of Balliol college, and the president of St. John's college), for the foundation of the scholarships which bear his name (at present 14 in number). The exhibitions have been the subject of much litigation in the court of chancery, and are now administered under a scheme settled in 1861. The exhibitors are nominated by the college of Glasgow, and received about £110 annually each during five years. Candidates for these scholarships must have been in born in Scotland, or must be sons of fathers born in Scotland, and must have resided for two years at least in Glasgow college, or for one year in that college, and two at least in some other college in Scotland. None are admitted to examination who have completed their 21st year, or have been members of the university of Oxford of more than two years' standing from the day of their matriculation inclusive.

SNELLING, WILLIAM JOSEPH, 1804-48; born in Boston; graduated at West Point; successively fur-trapper and lead miner in the west, journalist in the east, and editor *Boston Herald*; pub. *Truth*, a satirical poem, *Tales of the Northwest*, *Polar Regions of the Western Continent Explored*, etc.

SNIA'TYN, a t. of Galicia, in Austrian Poland, is situated on the Pruth, and was formerly a frontier stronghold. It has tanneries and a considerable trade in cattle and horses. Pop. '90, 10,939, among whom are many members of the Armenian church.

SNIDER RIFLE, a form of breech-loader which was adopted in 1866 by the British government, by altering the old Enfield muzzle-loaders in accordance with the Snider system. See **BREECH-LOADING ARMS**.

SNIPE, *Scolopax*, a genus of birds of the family *scolopacidae* (q.v.), having a very long straight bill, with nasal grooves extending almost to the tip, which expands a little, the upper mandible slightly exceeding the lower in length, the whole bill soft and very sensitive, smooth and shining in the living bird, but soon after death becoming pitted like the end of a thumb by drying. The head is compressed; the eyes large, and placed far back in the head, an evident adaptation to the mode of life, enabling the bird to guard against danger, while its bill is plunged in the mud. The feet have three toes before, divided to the base or very nearly so, not edged by membrane, the hind-toe short. The tail is short. The genus naturally divides itself into two sections, sometimes regarded as distinct genera, the first consisting of the woodcocks (q.v.), to which the generic name *scolopax* is appropriated; the second containing the species popularly known as snipes, which receive the generic name *gallinago*, and are distinguished by their lighter form, by their longer legs, and by having a little of the lower part of the tibia bare.—The **COMMON SNIPE** (*S. gallinago*, or *gallinago media*) is about 11 in. in entire length, the bill almost 3 inches. The sexes are alike in plumage, but the female is rather larger than the male. The general color of the upper parts is blackish brown, finely mixed with pale brown and with a rich buff color; three pale brown streaks along the head; the neck and breast pale rust color mottled with black; the belly white. The tail consists of 14 feathers. The snipe, when flushed, changes its course several times in a zigzag manner in the air, and then darts off very swiftly, so that young sportsmen find it a very difficult bird to shoot. The snipe makes a very inartificial nest of a little dry herbage, in a depression of the ground, or sometimes in a tuft of grass or rushes. The eggs are four in number, pale yellowish or greenish white, the larger end spotted with brown. This species of snipe is plentiful in all the moory and marshy parts of Britain, and generally throughout Europe, also in some parts of Asia, and it is found in the n. of Africa. It breeds in Britain, even in the s. of England, although many of the snipes which spend the winter in Britain migrate northward in spring. The snipe is capable of being tamed, and becomes very familiar, but is difficult to keep from the prodigious quantity of worms and other such food which it requires. A tame snipe has been known to eat nearly twice its own weight of worms in 12 hours. The snipe is in high esteem for the table, and is included among game in America.—The habits of all the other spe-

cies of snipe correspond very nearly with those of the common snipe. The GREAT SNIPE, or SOLITARY SNIPE (*S. or G. major*), is comparatively a rare bird in Britain, but abounds in the extensive marshes of continental Europe, and is found also in Asia. Its entire length is about 12½ in., the bill not quite so long in proportion as that of the common snipe. There are 16 feathers in the tail.—The JACK SNIPE, or JUNCOCK (*S. or G. gallinula*), the smallest of the British species, is like the common snipe in plumage. It is common in Britain, but mostly as a winter visitant, and is found also during summer or winter, in most parts of Europe and of the n. of Asia.—North America has a number of species. The COMMON AMERICAN SNIPE (*S. or G. wilsoni*) is about equal in size to the common snipe of Europe, and much resembles it also in plumage. The tail has 16 feathers. This species is abundant in summer in the northern parts of the United States and in Canada, in the more southern states in winter. It is in much request for the table, and is often caught in snares.—Snipes are found also in other parts of the world. The name snipe is extended in popular usage to include the genus *macrorhamphus*, in which the outer toes are connected at the base by a membrane. In other characters, as well as in plumage and habits, the similarity to the true snipes is very great. The RED-BREASTED SNIPE, or BROWN SNIPE (*M. griseus*), of North America has been occasionally seen in Britain and in Scandinavia. In size it is nearly equal to the common snipe. See *illus., OSTRICH, ETC.*, vol. XI.

SNIPE-FISH. See TRUMPET FISH.

SNIZORT, LOCH, a large and picturesque inlet of the sea, in the n.w. of Skye (q.v.), between Trotternish point and Vaternish point. At its head, the loch is only a few furlongs broad; but it gradually expands, and at its entrance the breadth is over 7 miles. It is 13 m. long.

SNOHOMISH, a co. situated in n.w. Washington, having Admiralty inlet on the w.; drained by the Snoqualimi and Steilacquamish rivers; 1720 sq.m.; pop. '90, 8514 of American birth, with colored. The Cascade range forms its e. boundary, and on its slopes and by the streams are extensive tracts of wood land and groves of fir and spruce. Lumber is the chief source of revenue. Near the inlet are cranberry marshes, and the soil of the plains is adapted to grain and to stock-raising. Co. seat, Snohomish.

SNORRI STURLESSON, a learned historian, and a distinguished Icelandic politician, was b. in 1179 at Hvammi, in Iceland, where his family, who traced their descent to the ancient kings of Norway and Sweden, had been settled since the early colonization of the island. Snorri Sturlesson was placed at an early age under the care of Jon Loptson, the grandson of Sæmund Sigfusson, the learned compiler of the old Edda, by whom he was instructed in the history, mythology, and poetry of the n., as well as in classical literature. By his marriage, at the age of 26, with a rich heiress, and the speedy death of his father, Snorri Sturlesson early attained a position of wealth and influence, and by the free choice of the people, was elected supreme judge, or chief magistrate of the island. In this post, he was distinguished for his profound knowledge of the laws and civil institutions of his native country; but his ambition, avarice, and love of intrigue embroiled him personally in sanguinary feuds, and contributed to hasten the destruction of Icelandic independence. His love of intrigue led him to take part in the intestine troubles of Norway, and thus drew upon him the suspicion and ill-will of the Norwegian king, Hakon, who sent secret instructions to Iceland for his arrest; or, if need be, his assassination. The king's intentions were carried out to their fullest extent; and his numerous enemies joining together in a plot against him, Snorri Sturlesson was attacked in his own house, and murdered in the year 1241. Snorri Sturlesson was a poet of no mean order, and composed numerous *drapas*, or laudatory poems, on the kings and jarls at whose courts he sojourned. His great work is the *Heimskringla*, or Mythic Ring of the World, in which he records the history of the kings of Norway from the earliest times to the death of Magnus Erlingsson, in 1177; and which he compiled from ancient genealogical tables and other documents. It was translated into Danish about 1559 by Peder Clauson, and published first by Olaf Worm (Cop. 1633). This translation has been republished in more recent times by Gruntvig (3 vols., Cop. 1818-22) and others. German, Swedish, and Latin versions have also been executed. Snorri Sturlesson is believed to have had a share in collecting and arranging the songs of the elder or poetic Edda (q.v.), and to have contributed very materially toward the compilation of the *Skalda* and other parts of the younger or prose Edda.

SNOW is the frozen moisture which falls from the atmosphere when the temperature is 32° or lower. It is composed of crystals, usually in the form of six-pointed stars, of which about 1000 different kinds have been already observed, and many of them figured, by Scoresby, Glaisher, and others. These numerous forms have been reduced to the following five principal varieties—1. Thin plates, the most numerous class, containing several hundred forms of the rarest and most exquisite beauty. 2. A spherical nucleus or plane figure studded with needle-shaped crystals. 3. Six or more rarely three-sided prismatic crystals. 4. Pyramids of six sides. 5. Prismatic crystals, having at the ends and middle thin plates perpendicular to their length. The forms of the crystals in the same fall of snow are generally similar to each other. The crystals of hoar-frost being formed on leaves and other bodies disturbing the temperature, are often irregular and

opaque; and it has been observed that each tree or shrub has its own peculiar crystals. Snow-flakes vary from an in. to $\frac{1}{100}$ of an in. in diameter, the largest occurring when the temperature is near 32°, and the smallest at very low temperatures. As air has a smaller capacity for retaining its vapor as the temperature sinks, it follows that the aqueous precipitation, snow or rain, is much less in polar than in temperate regions. The white color of snow is the result of the combination of the different prismatic rays issuing from the minute snow-crystals. Pounded glass and foam are analogous cases of the prismatic colors blending together and forming the white light out of which they had been originally formed. It may be added that the air contained in the crystals intensifies the whiteness of the snow. See RED SNOW. The limit of the fall of snow coincides nearly with 30° n. lat., which includes nearly the whole of Europe; on traversing the Atlantic, it rises to 45°, but on nearing America descends to near Charleston; rises on the w. of America to 47°, and again falls to 40° in the Pacific. It corresponds nearly with the winter isothermal of 52° Fah. Snow is unknown at Gibraltar; at Paris, it falls 12 days on an average annually, and at St. Petersburg 170 days. It is from 10 to 12 times lighter than an equal bulk of water. From its loose texture, and its containing about 10 times its bulk of air, it is a very bad conductor of heat, and thus forms an admirable covering for the earth from the effects of radiation—it not unfrequently happening, in times of great cold, that the soil is 40° warmer than the surface of the overlying snow. The flooding of rivers from the melting of the snow on mountains in summer, carries fertility into regions which would otherwise remain barren wastes. See GLACIER.

SNOW-BALL TREE. See GUELDER ROSE.

SNOWBERRY, *Symphoricarpos*, or *Symphoria racemosa*, a bushy deciduous shrub of the natural order *caprifoliaceæ*, a native of the northern parts of North America, and now very common in British shrubberies. It has simple leaves and small flowers; berries about the size of black currants, remaining on the bush after the leaves, quite white, but uneatable.—The name SNOWBERRY is also given to *Chiogenes hispidula*, a native of the bogs of North America.

SNOW-BIRD, *Junco*, or *Fringilla hyemalis*, a North American bird of the finch family (*fringillidæ*), common from Louisiana to the fur countries, in all the eastern parts of North America. The wings are rather short, the tail slightly notched. The whole length is rather more than 6 in.; the upper parts are lead-color, the lower parts white, the two outer tail-feathers white, the next white margined with black. This bird migrates northward early in spring, and southward late in autumn. It is often to be seen in small flocks, visiting barn-yards, and hopping about with the domestic poultry. In cold weather, it retires to holes in haystacks. Its song is sweet. From its frequent familiar approach to human habitations, the snow-bird is regarded with favor throughout great part of North America, as the redbreast is in Britain. In the s., however, it is often brought to market. A similar species is the OREGON SNOW-FINCH (*P. Oregona*).

SNOW-BUNTING, or SNOW-FLECK, *Plectrophanes nivalis*, a bird of the bunting family (*emberizidæ*), of a genus distinguished from the true buntings by the long and nearly straight claw of the hind-toe, in this resembling the larks. There is also an approach to larks in habits; there is a similar ease and celerity in running along the ground, and the song is very different from that of any of the true buntings. The snow-bunting abounds in summer in all parts of the arctic regions, and in winter in more southern countries of Europe, Asia, and America. Linnæus says it is the only living creature that has been seen 2,000 ft. above the limits of perpetual snow on the mountains of Lapland.

SNOWDEN, JAMES ROSS, 1810-78, b. Pa.; was numismatist; speaker house of rep., Pa., 1842-44; state treasurer, 1845-47; treasurer U. S. mint, 1847-50; director, 1853-61; pub. *Description of Coins in the U. S. Mint* (1860), *Coins of the Bible* (1864), etc.

SNOWDON, a mountain-range in Caernarvonshire, n. Wales, stretches in a n.e.n. direction from a point 5 m. n. of Criceith, near the head of Cardigan bay, to near Conway; but is broken up by valleys and river-courses into four mountain groups, whose chief peaks are Carnedd-Llewelyn, 3,482 ft.; Moel-Siabod, 2,865 ft.; and Moel-y-Wyddfa ("the conspicuous peak"), the highest mountain in s. Britain, 3,588 ft. above sea-level. Seen from the top, Moel-y-Wyddfa, the "King of Snowdonia," appears to send out three ridges, which gradually divide and subdivide, giving birth to numerous valleys and corries. The ascent of the highest peak of Snowdon is effected by tourists from Llanberis (on the n.), Beddgelert (on the s.), Llyn-Cwellyn (on the w.), and Capel Curig (on the e.); the first is shortest and easiest; the last is longest, most difficult.

SNOW-DROP, *Galanthus*, a genus of plants of the natural order *amaryllidæ*, of the same tribe with amaryllis, snowflake, crinum, etc. The three outer segments of the perianth spread, so as to make a bell-shaped flower; the three inner are shorter, erect, and notched at the summit. The flowers arise from a spathe. The root is bulbous, and produces two leaves and one single-flowered leafless stem (*scape*). The common snow-drop (*G. nivalis*), a plant too well known to need description, is a native chiefly of the s. of Europe, growing in woods and pastures. It is found apparently wild in some places both in England and Scotland, but is probably rather naturalized than native. See illus.,

FLOWERS, vol. VI., fig. 32. Another species of snow-drop (*G. plicatus*), with much broader leaves, is found in the s. of Russia and in Asiatic Turkey.

SNOW-DROP TREE, or **SILVER-BELL TREE**, a popular name for a genus of styrax, *Halesia tetrapetala* and *H. diptera*, named after Stephen Hales, author of *Vegetable Statics*. They are shrubs or small trees, with large and veiny pointed deciduous leaves, and showy white flowers, drooping on slender pedicels in short racemes or clusters from axillary buds of the preceding year. Calyx inversely conical, 4-toothed; petals 4, united at the base, or middle, into an open bell-shaped corolla; stamens, 8 to 16; filaments united into a ring at the base; ovules 4 in each cell; fruit large and dry, 2 to 4 winged; seeds single, cylindrical. They are beautiful shrubs for cultivation. A third species grows in Florida, *H. parviflora*.

SNOW-FLAKE, a popular name for the *Leucojum vernum*, *L. aestivum*, and *L. autumnale*, species of European herbs of the amaryllis family which have been introduced into gardens in the United States. They are among the hardy bulbous plants. See **AMARYLLIDÆ**, and **SNOWDROP**.

SNOW-LINE. The snow-line marks that height above the sea-level below which all the snow that falls annually melts during summer; higher than this lies the region of perpetual snow. No general rule for the height of this line can be given, owing to the different causes which may determine it. These are—the situation of the slope in respect of the sun's rays, and hence, other things being equal, it is higher on the s. than on the n. side of mountains; the situation with respect to the rain-bringing winds; the steepness of the slope; and the dryness or humidity of the region. The following are the observed heights of the snow-line in English feet in different parts of the globe:

	N. Lat.	Height.
Spitzbergen.....	78	0
Sulitelma, Lapland.....	67	3,835
Kamtchatka.....	59½	5,249
Unalashka, W. America.....	56½	3,510
Altai.....	50	7,084
Alps.....	46	8,885
Caucasus.....	43	11,063
Pyrenees.....	42¾	8,950
Rocky Mountains.....	43	12,467
North Himalaya.....	29	19,560
South Himalaya.....	28	15,500
Mountains of Abyssinia.....	13	14,065
Purace, Colombia.....	2¼	15,381

	S. Lat.	Height.
Nevados of Quito.....	0	15,820
Arequipa, Bolivia.....	16	17,717
Paachata, Bolivia.....	18	20,079
Portillo, Chili.....	33	1,473
Cordilleras, Chili.....	42¼	6,010
Magellan, Strait.....	53½	3,707

SNOW-PLOW, A, is a machine for clearing roads, railways, etc., of snow. For railways there are several forms, from the smooth iron sides attached to the front of an ordinary locomotive, to the machines of immense size and weight and complicated mechanism. Since the era of Trans-Continental railways much attention has been given to the subject, and several forms have been invented, of which the Rotary Steam Snow Shovel seems to meet with most favor. It has been adopted by all the Trans-Continental lines of the United States and Canada; also by many of the eastern and western Trunk lines. It consists of a wheel nine feet in diameter set in a round casing with a flaring front ten feet square which feeds the snow into the wheel. The wheel contains an inner and outer series of knives pivoted on radial pins, with their surfaces inclined to one another; when they encounter any snow, they are *canted*, or set so as to slice it off and feed it into the machine. Behind the knives is a fan-wheel composed of a number of radial blades. When the wheel revolves, the centrifugal force throws the snow to the outside of the wheel, where it meets the enclosing case, and is forced through an opening just behind the headlight. A hood to this opening regulates the direction in which the snow is thrown. The weight of the machine is about twenty tons. The "Rotary" was invented by Orange Jull, a Canadian, in 1884. The right to build these machines was immediately purchased by a company in Paterson, N. J., and the first one constructed in the United States was by them, in 1885. A trial made of it in Buffalo the same year was considered extremely successful. Another machine much used by various railroads in eastern Canada is the "Russell." Other machines worthy of mention are the Jull Centrifugal Snow Excavator, built in 1889; also the Cyclone Snow-Plow, a powerful machine invented the same year by E. P. Caldwell of Minneapolis, Minn. See *illus.*, **RAILWAYS**.

SNOW-SHOES, a species of shoe much used by the Esquimaux, Laplanders, and others who inhabit those regions where snow prevails for a great portion of the year. It consists of a flat frame, of a lanceolate form, from 8 to 14 in. in breadth at its widest part, and of great length—sometimes as much as 7, though generally about 4 feet. It is either wholly of wood or is a wooden frame filled in with wicker-work or thongs, and has cross-straps on the upper surface to attach it to the foot. The broad surface prevents the foot from sinking in the snow. See illus., *NORTH AND SOUTH AMERICA*, vol. I., figs. 8, 9.

SNUFF. See **TOBACCO**.

SNYDER, a co. in central Penn., bordered by the Susquehanna river on the e., crossed by a branch of the Pennsylvania railroad, drained by Penn's and Middle creeks; 325 sq. m.; pop. '90, 17,651. The surface is mountainous and mostly covered with forests of oak, chestnut and hickory; the soil is fertile. The main productions are wheat, corn, hay, wool, clover-seed, and lumber; cattle, sheep, and swine are raised. It contains large deposits of coal and iron. Carriages, etc., leather, flour, and lumber are manufactured. Co. seat, Middleburg.

SNYDERS, or **SNEYDERS**, **FRANS**, a Belgian artist, celebrated for his powers as an animal-painter, was b. at Antwerp in 1579, and was formed in the school of Henry van Baelen. Originally, he confined himself exclusively to painting fruits, and worked with Rubens. In his pictures, with figures by Rubens, Jordaens, Honthorst, and Miervelt, it is difficult to discover any difference of touch. For Philip III. of Spain he executed several hunting and battle pieces. Snyder knew how to give expression to the passions of the lower creation, and his bear, wolf, and boar fights are scarcely surpassable. The best specimens of the artist are contained in the galleries of Vienna, Munich, and Dresden, but there are also some fine pictures of his in private English collections. Snyder died at Antwerp in 1657.

SOAP (Lat. *sapo*(n), Welsh *sebon*—the Romans considered soap to be a Celtic invention). This well-known material, according to Pliny, first became known to the Romans by their conquest of Gaul. There are some notices of it in the English version of the Bible, but it is believed that the words *borith* and *nether*, there rendered into soap, really mean potash and soda.

The *chemical composition* of soap may be explained as follows: The fixed fatty bodies, stearine, palmitine, and oleine (we do not include margarine, for it is now generally admitted that the fat to which this name was applied is merely a mixture of stearine and palmitine), when heated with alkaline solutions, undergo the remarkable change known under the title *saponification*, or conversion into soap, during which process the fats yield up a clear viscid liquid, which, from its sweetness, is termed *glycerine* (q. v.). The nature of this change may be ascertained by decomposing the soap that is thus formed, and which exists as a homogeneous transparent mass, freely soluble in warm water, by the addition of some acid, such as tartaric or hydrochloric, which combines with the alkali, and forms a soluble compound with it. A fatty matter separates in flakes, which melt on the application of heat, and form an oily layer on the surface of the fluid. This substance, when cold, is found to be very different from the original fat. It has acquired a strongly acid reaction, as may be ascertained by applying test-paper to it in its melted state, and it is freely soluble in alcohol, the solution being strongly acid. It at once forms a clear solution in hot alkaline liquids, while the original fat would under similar conditions have formed a milky-looking fluid. It is, in fact, a true *acid*, capable of forming salts, the potash and soda salts being known as *soft-soap* and *hard-soap*, which have been thus generated out of the elements of the neutral fat would under the influence of the alkali. Stearine, when thus treated, yields *stearic acid* (q. v.); palmitine yields *palmitic acid* (q. v.); and oleine, *oleic acid* (q. v.); while common fat, which is a mixture of the three above-named fats, affords, on saponification with an alkali, and subsequent decomposition of the soap, a mixture of the three fatty acids.

The term soap is sometimes extended in meaning, so as to include compounds of the fatty acids with other bases besides the alkalies, e. g., lime, baryta, magnesia, etc.; but these compounds being insoluble are inapplicable to the purpose of cleaning. The true soaps owe their cleaning power to their solubility, and their attraction for the matters that ordinarily constitute "dirtiness." The presence of a portion of free alkali increases the detergent power, especially in the case of greasy matter.

Manufacture.—In Great Britain, and in the n. of Europe generally, hard-soap is made from tallow, palm-oil, bone grease, and kitchen fat, by boiling to saturation with caustic-soda. Cocoa, palm nut, and some other oils are occasionally used, chiefly in imitating superior soaps, and the only other ingredient of consequence is rosin, the residuum of the distillation of rough turpentine. In the s. of Europe, coarse olive-oil is the staple material, and from this is produced the marbled soap known as "Marseilles."

The soap-maker first dissolves in boiling water 6 to 8 cwt. of crude soda-ash (see **SODA**) in a cast-iron circular vessel (contents may be 1000 gals.), furnished with a steam-pipe in its center. He then adds half the weight of *pure caustic lime*, and boils the mixture. When the lime has rendered the soda caustic, the boiling is discontinued, subsidence takes place, and the lye is ready for use.

Soap-pans are of various sizes. One of moderate dimensions may turn out from six

to eight tons, and is usually formed of four pieces of cast-iron—lower casting, say five feet in diameter; upper, eleven. Heat is applied either by means of a furnace beneath the bottom piece, or by open steam introduced by a pipe led to a circular perforated ring at the bottom of the pan. Steam boiling being now extensively adopted, our description will apply to that method.

Curd or White Soap.—20 cwt. of tallow being put into the soap-pan, and a quantity of the prepared lye, steam is turned on, and boiling continued until the lye is thoroughly incorporated with the tallow, and becomes a pasty mass. A few shovelfuls of common salt are now thrown in when the lye begins to separate. The partially formed soap is allowed to cool, and the salted lye, now deprived of its soda, subsides, and is drawn off from the bottom by a pipe, or removed by a pump. The operation of adding and boiling with lye is repeated until the tallow is saturated with soda, and the lyes show as much alkali after boiling as before. The soap is now treated with weaker lye, and by more or less water brought to the consistency the maker requires. From its tendency to thicken rapidly, it is transferred to the frame at a higher temperature than the soap next described.

Pale or Yellow Soap.—When the tallow is saponified as above described, about one-third of its weight of rosin is added, and the boilings with lye repeated, until the mass is thoroughly saponified. The practiced workman being aware that perfect soap is insoluble in strong alkali, avoids the risk of imperfect particles escaping the action of the lye from being enveloped in perfect soap, by reducing the mass with water, and adding lye gradually until the soap again floats as a curd on the liquid. The soap is then cooled down, and the lye being removed as completely as possible, it is boiled with the quantity of water necessary to bring it to the consistency required. These later operations require much experience, and the best theoretical knowledge requires the aid of tongue and eye to carry them through with success. The soap being now *finished* (the technical term), the copper is covered up, and the contents allowed to settle until the temperature falls to about 160° Fahrenheit. According to the quantity of water used, so is the deposit, called the *nigre*, greater or less. When too much water is used, the produce of soap is too small; when too little, the produce is large, but of inferior quality, from the insufficient deposit of impurities. This *nigre* is employed in making second-class soap. When of proper temperature, the soap is removed, into frames, now mostly made of cast-iron, containing about 10½ cwt. each, where, after solidifying, which it does in three days, it is cut by wire into slabs, which are again cut transversely into bars ready for the market.

London mottled is made of kitchen fat (no rosin). The process described in the making of curd soap is followed here, except that when perfect the soap is, when almost boiling, put into wooden frames three or four times as high as the ordinary frame of 52 in., and the lye allowed to percolate through the soap to the lower part of the frame, producing the mottled appearance desired. As this soap, when subjected to any mixing operation, lost its *mottle*, it long enjoyed a high reputation as a genuine soap; but now that cheap imitations, having a beautifully marbled appearance, are produced from cocoa and palm nut oils, with coloring and siliceous matter, its prestige is somewhat on the wane.

The numerous patents taken out for improvements in soap-making have had for the most part more the object of cheapening, by the addition of various articles to soap in its semi-fluid state, than of improving the manufacture.

Soft-soap differs from hard from having potash for its base instead of soda. The repeated changes of lye described in the manufacture of hard soap are here inadmissible, for all the lye employed remains in combination with the oily materials, and is never separated. Hence open steam, as throwing in water into the mass, cannot be applied, nor can salt, so useful an agent in the former manufacture, be used, as it would tend to separate the soap from the lye, while a thorough combination is essential. The making of soft-soap requires much experience and nicety, it being so easy to overdo the supply of alkali, which cannot happen in hard-soap. A ton of materials, consisting of 1900 lbs. of fish or other oil, with 340 lbs. tallow, is put into the soap-pan with 200 gallons of American potash lye of such strength that 6,600 grains of real potash are in each. After being boiled by the heat of a furnace, and well beat down on the surface to keep in bounds the frothy mass, a stronger lye, containing about 8,700 grains of potash per gallon, is added at short intervals, and the boiling carried on until the workman ascertains by taste and appearance that the soap is perfect. The tallow serves to give consistency to the soap, and also produces white specks of stearate of potash, which much enhance its appearance.

SOAP, MEDICAL USES OF. The only kind of soap that should be used internally is *white soda soap*. It is prepared from caustic soda and either olive or almond oil. In its purest state it is called *medicinal soap*, while in its less pure forms it is known as *Allicant*, *Venice*, or *Spanish soap*. When properly made, it should be perfectly soluble in pure water and in alcohol. It is chiefly employed to form pills of a gently aperient and ant-acid action. Pills containing a combination of soap and dried carbonate of soda are of great use in certain forms of gravel. Soap is often added to pills as an adjuvant, or for the purpose of preventing them from becoming hard and insoluble. White soap affords a ready antidote in cases of poisoning with the strong mineral acids. *Soft-soap* ought to

be made with olive oil and potash, and it should be of yellowish-white color, inodorous, and of the consistence of thick honey. It is of great service as an external application, either alone or in association with sulphuret of potash and other remedies, in various cutaneous affections.

SOAPBERRY, *Sapindus saponaria*, a West Indian tree of the natural order *sapindaceæ*, the pulp of the fruit of which is used instead of soap in washing. This property belongs to other species of the same genus. With the exception of *S. marginatus*, found in the southern states of North America the genus is entirely tropical. The use of the pulp as soap, if often repeated, is apt to injure linen; but it is capable of cleansing as much linen as sixty times its weight of soap. Each fruit contains a nut of a shining black color. These nuts are very hard, and were formerly imported into Europe to be made into waistcoat buttons, being tipped with silver or other metal. They were little liable either to be injured by wearing or to be broken.

SOAP-STONE. See **STEATITE**.

SOAP-TEST. This test, for which science is indebted to Prof. Clark of Aberdeen, is now universally employed for determining the degree of hardness of water. Every one knows how much more readily a lather is formed—as, for example, in washing the hands—with soft than with hard water. This is accounted for by the earthy bases of the hard water displacing the alkaline bases of the soap, and forming compounds insoluble in water. This is the foundation of the soap-test. A hard water of known strength is first prepared by dissolving 16 grains of pure carbonate of lime in pure hydrochloric acid, evaporating to dryness, and dissolving the resulting chloride of calcium in a gallon of distilled water. This gallon of chloride of calcium solution accurately represents a natural water whose hardness is due to 16 grains of carbonate of lime in a gallon. A solution of soap in proof-spirit is next prepared of such strength as that a quantity of it which will fill 32 measures of a volumetric tube, each measure of which contains 10 grains, will be exactly able to convert 1000 grains' measure of the standard solution of hard water into the earthy soap described. This point is thus ascertained: The hard water is placed in a stoppered bottle, and the soap solution added to it by degrees, the bottle being shaken after each addition, when a bubble will form, which rapidly disappears so long as any lime is present; but when at last it is all used up, a froth of soap bubbles remains after hard shaking, such as to last unbroken for three minutes. If, now, a given sample of water be examined, and this point is reached at the expense of the entire 32 measures, it is a water of 16 degrees of hardness. Now, perfectly soft water consumes 2 measures of the soap solution before permanent bubbles are formed, so that a water of 16 degrees of hardness has in reality only consumed 30 measures of the soap solution. But $\frac{16}{30} = 0.53$;

hence, if any given measures of the soap-test be used in estimating the hardness of a water, we must first subtract 2 from the amount, and then multiply by 0.53; and the result will give us the degree of hardness. For example, let a given sample require 27 measures of the soap-test. On subtracting 2 and multiplying by 0.53, we find its hardness to be 12.25. Clark's Soap-test Table for Hardness of Water is given in the article "Soap-test" in Knight's *English Cyclopædia*; and full details regarding the mode of working the test, to determine the amount of lime, magnesia, soda, sulphuric acid, and pure carbonic acid, are given in Dr. Parkes's *Manual of Practical Hygiene* (Lond. 1864).

SOAPWORT, *Saponaria*, a genus of plants of the natural order *caryophyllaceæ*, having a cylindrical or ventricose 5-toothed calyx, without any outer calyx or attendant bractææ, five undivided petals with long claws, ten stamens, two stigmas, and a capsule opening at the top by four valves. Some of the species have very beautiful flowers. *S. calabrica* has of late become one of the most favorite annuals of our flower-gardens.—**COMMON S.**, Bouncing Bet (*S. officinalis*), is found on waysides, in thickets, and on banks of streams, in most parts of Europe, although it is a somewhat doubtful native of Britain. Both the root and the leaves contain saponine (q.v.), in consequence of which they are sometimes employed for washing. The brownish-red color of the bark of the root, however, is apt to tinge white articles. The root of this plant has also medicinal properties, being aperient, resolvent, and alterative. It is sometimes sold as **RED SOAP-ROOT**.

Nearly allied to the genus *saponaria*, but having an angular calyx and a 5-valved capsule, is the genus *gypsophila*, some species of which are called **SOAP-ROOT**, and contain much saponin. Thus, the **EGYPTIAN SOAP-ROOT** (*G. struthium*), and the **SPANISH SOAP-ROOT** (*G. Hispanica*), called *Jabonera* in Spain, have been employed for washing from time immemorial, and the roots not having a dark rind can be used for washing white articles, and are to some extent an article of commerce, being used for silken and other stuffs, the colors of which will not bear the application of soap. The roots of *lychnis dioica*, one of the most common British plants, possess the same properties in an inferior degree.—The bark of *quillaja saponaria*, a Chilean tree of the natural order *Rosaceæ*, contains much saponin, is generally used for washing in Chili and Peru, and there forms a considerable article of commerce.—Some of the tropical South Sea islands produce a species of vine (*vitis saponaria*), the stem of which, especially the thicker part, cut into pieces, and softened by cooking on hot stones, produces in water a rich lather almost equal to that of soap. See also **SOLANUM**.

SOBBING is merely a modification of the ordinary movements of respiration excited by mental emotions. It is the consequence of a series of short convulsive contractions of the diaphragm, and is usually accompanied by a closure of the glottis, temporarily preventing the entrance of air into the lungs.

SOBIESKI, JOHN. See JOHN III.

SOBRAON', a village on the left bank of the Sutlej, 45 m. s.e. of Lahore, near which, on Feb. 10, 1846, a most obstinate battle was fought between the British army of 15,000 men, under sir Hugh Gough, and a Sikh force numbering 80,000. The Sikhs were strongly intrenched, and vigorously resisted the attacks of their opponents, but the courage and perseverance of the latter ultimately gave them the mastery; the various earthworks were captured in succession, and the Sikhs driven across the Sutlej, with a loss in killed, wounded, and drowned of 13,000. Gough immediately followed up his victory by crossing into the Punjab in pursuit of the fleeing enemy.

SOCAGE, or **SOCAGE** (originally *hlaford-soen*, seeking a lord; whence we have also *soc*, a right of holding a court), a tenure of lands in England, of which the characteristic feature is, that the service is fixed and determinate in quality, thereby differing both from knight-service and from villeinage. It was originally peculiar to the Anglo-Danish districts of England. At the time when the allodial tenure was converted into immediate dependence on the crown, this tenure seems to have arisen out of the necessity for commendation or seeking a lord. In Domesday, socmen are often mentioned as bound "to seek a lord," or free to go with their land where they pleased. The socmen of Stamford are said to be free to seek a lord, being only liable to the king for the toll attached to them as inhabitants of a borough. The obligation of socage in its origin has been compared to the mutual bonds of allegiance of later times so common in the highlands of Scotland, and known as bonds of manrent (see **MANRENT**). Three kinds of socage have been enumerated as existing at a later period—viz., free and common socage, socage in ancient tenure, and socage in base tenure. The second and third kind are equivalent to tenure in ancient demesne and copyhold tenure (see **DEMESNE**, **ANCIENT** and **COPYHOLD**), and the first is what has generally and more properly been denominated socage, where the services were both certain and honorable. Besides fealty, which the socager was bound to do when required, he was obliged to give attendance at the court baron of his lord, if he held one, either for a manor or for a seignior in gross.

By an act passed during the commonwealth, and confirmed after the restoration by 12 Car. II. c. 24, tenure by knight-service was abolished, and all lands except church-lands held in free alms, were directed to be held in free and common socage, which is now (with that exception) the universal tenure of real property in England and Ireland.

Socage tenures are unknown in Scotland, where, unless at a very early period, they never existed.

SOCIALISM, the name given to a class of opinions opposed to the present organization of society, and which seeks to introduce a new distribution of property and labor, in which organized *co-operation* rather than *competition* should be the dominating principle, under the conviction that the happiness of the race, and especially of the classes without capital, would be benefited thereby. Historically considered, socialism, like many of the significant phenomena of our age, is a product of the French revolution. That terrible outburst of popular discontent is most properly regarded as an anarchic attack on the social system that had its roots in the feudalism of the middle ages. The furious hatred of the court and the aristocracy, the passionate love of the "people," of "humanity," of "liberty," though called forth by special circumstances, and never formally worked out into a theory of social life, virtually contained in themselves the germs of all later proposed organizations. In the middle ages, the *right* of freely and fully enjoying life, property, and political independence was limited to a favored few; while the great masses were condemned to dumb servitude, and a perpetual minority. Even the industrial population did not recognize the socialistic idea. The members of the different guilds or fraternities claimed exclusive right to exercise certain branches of industry, and probably the great majority of the inhabitants of a town remained in a disregarded and dependent state. Amid such social conditions, resting, as they did, on a belief in the necessity of different distinct ranks, the free action of individual life, and even the vital progress of the whole community, became well-nigh impossible. We have not space here to trace the course of the various minor reforms that weakened the authority of the mediæval theory of life; but we must not omit to notice the speculations of the political philosophers of the 18th c. in France, England, and Germany, as operating powerfully in favor of a new social system, in which the idea of humanity (assuming, at the French revolution, as we have observed, the concrete form of the "people") stands out prominently. Nevertheless, the first shape that the modern spirit of industry took was not socialistic, in the strict and proper sense of the term; it was rather individualistic, and found, as it still finds—for it is yet the prevailing theory—its natural expression in such proverbs as, "A fair field, and no favor," "Every one for himself, and God for us all." But still, even this lawless individualism is to be regarded as a protest against the false *class-legislation* of preceding times, and as an assertion of the absolute right of *each member of society* to a share in the general welfare. That it has not universally commended itself to civilized mankind as a perfect system, is demonstrated by the appearance and temporary popularity of such schemes of society as those of Owen (q.v.), Fou-

rier (q.v.), St. Simon (q.v.), and the enthusiasm excited at intervals in different parts of Europe by the promulgation of extreme communistic opinions. See COMMUNISM. It is objected to socialism, under its various forms, that it makes human happiness too much dependent on material gratifications; that it robs man of that energy that springs from ambition; that it unphilosophically ignores an individualism and inequality to which nature herself has given her inviolable sanction; and that, by the abolition of social rewards and punishments, it neither holds out any hope to the industrious, nor excites any apprehension among the indolent. On the other hand, we must admit that the vigorous assertion of socialistic principles has led men to a more liberal and generous view of humanity as a whole. Moreover, it has forcibly called public attention to numerous evils that have sprung up along with the modern development of industry, for which no remedy—not even a name—had been provided; to the vital interdependence of all classes; and to the inadequacy of the individual or “selfish” system, as it has been called, to redress the wrongs or cure the evils that inevitably spring from its own unchecked operation. The recent spread of socialistic opinions in Germany led to the enactment of the so-called Socialist Laws in 1878, placing the cities of Berlin and Leipsic in a state of siege, and vesting in the police very arbitrary powers of repression. How little these laws availed was seen by the remarkable growth in the political power of the German socialists, who in 1890 polled 1,427,323 votes as against 763,128 in 1889. In October, 1890, the Socialist Laws expired by limitation and were not re-enacted. See COMMUNISM: INTERNATIONAL WORKINGMEN’S ASSOC.

SOCIAL SCIENCE, a name that has of late years been given to the study of all that relates to the social improvement of the community. A society called “the national association for the promotion of social science” was first organized at a meeting which was held under lord Brougham’s auspices in July, 1857, to consider the best means of uniting together all those interested in social improvement. The annual meetings have been held each year at a different place. The association as now constituted comprises five sections—1. Jurisprudence and amendment of the law (sub-section, repression of crime); 2. Education; 3. Health; 4. Economy and Trade; 5. Art. The association aims at promoting improvement in all matters falling within these departments, by means of bringing together, for free discussion, societies and individuals interested in social problems.

SOCIOLOGY is the somewhat barbarous name that has of late been used to denote the study of the origin, organization, and development of human society.

SOCIAL WARS—wars with *socii* or allies. The most important social war was between Rome and the Italian peoples, such as the Samnites, Peligni, Marsi, etc., who desired to be admitted to the rights of citizenship. M. Livius Drusus, who had been the advocate of the Italian nationalities, was assassinated B.C. 91. The Italian allies of Rome at once revolted, and the three years’ war that followed—during which over 300,000 men are said to have lost their lives—though the Romans, under Marius and Sulla, inflicted terrible losses upon the allies, was substantially a victory for the latter, who eventually were granted the rights demanded. Athens had two social wars, the first with the allied cities of Cos, Chios, and Byzantium, whose independence was secured B.C. 357–55; the second between Athens and the Ætolian and Achæan leagues B.C. 220–17.

SOCIETIES are associations of individuals for the promotion or accomplishment of some particular object. Such objects are numerous, including the promotion and investigation of almost every well-recognized branch of science, art, and literature; the diffusion of knowledge, religion, and morality; intercourse between those of the same profession or trade; the removal of legal grievances; mutual aid in case of distress; and an abundance of other aims, which are either beneficial to the general public or to the members of the society alone. In Great Britain any number of persons may agree to constitute themselves a society if the object of their union is legal. Those whose objects are scientific or literary are occasionally called *academies* (q.v.), and under this or their own special names will be found notices of the chief societies at present existing. “Secret” societies for the accomplishment of some object which involves a subversion of existing political arrangements, spring up from time to time in France, Ireland, Italy, etc.

SOCIETY FOR PROMOTING CHRISTIAN KNOWLEDGE. A society formed in 1698 in the English church, having for its object Christian education in England and Wales, and the spread of the Bible in the colonies. The originator of it was a clergyman, Dr. Thomas Bray. In 1709 this society aided the Danish mission at Tranquebar. The Tanjore mission in 1726, and that at Trichinopoly in 1762, where Schwartz labored, were sustained by it. After the organization of other societies for the express purpose of propagating the gospel in foreign lands this society confined itself to the circulation of Bibles, tracts, prayer-books, etc.

SOCIETY ISLANDS, a small archipelago in the South Pacific ocean, in lat 16° to 18° s., long. 148° to 155° w., is formed of a number of islands, which are actually or practically under French rule. Exclusive of islets, the group is formed of 13 islands—Tahiti or Otaheite, Maitia, Eimeo, Maiaoiti, Tetuaroa, Otahua, Moorea, Tuba, Lord Howe’s Island, Scilly Island, Huahine, Raiatea, and Borabora. Area, 636 sq. m.; pop. about 16,000. The population of Tahiti is 10,113. The chief agricultural interest in Tahiti is

an estate in the hands of an English company. All the islands closely resemble each other in appearance. They are mountainous in the interior, with tracts of low-lying and extraordinarily fertile land occupying the shores all round from the base of the mountains to the sea. They are surrounded by coral reefs, are abundantly watered by streams, and enjoy a temperate and agreeable climate. Almost every tropical vegetable and fruit known is grown here, but agriculture is in a backward state. The animals are those usually found in the South Sea Islands. The inhabitants belong to the Malay race, are affable, ingenious, and hospitable, but volatile and sensual. The practice of tattooing has almost wholly disappeared, and the native costume now closely resembles that of civilized nations. There are now no native manufactures, these having been entirely superseded by imported goods. Cocoa-nut oil, oranges, lime-juice, kauri shells, and pearl shells are the principal articles exported; and cocoa-nuts are the general article of barter throughout the islands for calicoes, cotton cloth, knives, cordage, groceries, etc., which are imported chiefly from Tahiti. The exports from the islands amounted, 1895, to £97,361, and the imports to £97,361.

Tahiti is said to have been visited as early as 1606. Capt. Cook reached it in 1769, and discovered many of the other islands of the archipelago, to which he gave the name of Society Islands in honor of the Royal society of London. In 1797 the first mission-ship fitted out by the newly formed London missionary society arrived at Tahiti. After 19 years of apparently fruitless labor the influence of the missionaries began to be felt, and soon afterward became so powerful as to be almost paramount. A quarrel between the Protestant and Roman Catholic missionaries, who thought it better to enter upon ground already occupied by Protestants than to take up new ground for themselves, occasioned the interference of France in favor of the latter, and the island of Tahiti was taken possession of in the name of Louis Philippe by a strong French force in 1844. All the possessions of the native ruler—who, however, still enjoys nominal authority—were afterward placed under the protection of France; and by a treaty concluded in 1880, Tahiti and its dependencies (particularly Moorea, Tetuaroa, and Raiatea) became French possessions. Many of the Protestant missionaries left the island in consequence of the interference of the French authorities with their labors. Some, however, remained, and the congregations continued to meet. An application to the British government procured a concession on the part of the French government of some of the rights of religious liberty, which had been taken away by the local authorities. See illus., SANDWICH ISLANDS, ETC.

SOCINUS, the name of two celebrated heresiarchs, uncle and nephew, who have given name to a sect of Christians, the Socinians, better known, however, as Unitarians (q.v.). —**LÆLIUS SOCINUS**, the elder of the two, was b. at Siena, in Tuscany, in 1525, and belonged to a family that had long been distinguished for its cultivation of literature and science. His father, Marianus Socinus, was an able lawyer, and designed his son for the same profession. But Lælius soon displayed a strong preference for theological inquiry, and in order to better prosecute his biblical studies he made himself familiar with Greek, Hebrew, and Arabic. The only result of his legal training that one can discern is an obstinate aversion to believe anything "unreasonable." The principles of the reformation had slowly found their way into Italy, and in 1546 a secret society was formed at Vicenza for the discussion of religious questions. It was composed of 40 persons, distinguished by their rank, their occupations, and their titles. Socinus was admitted a member. The conclusions at which they arrived were unfavorable to the dogma of the Trinity, which they held to have been borrowed by the early church from the speculations of Greek philosophers. The purpose of their meetings together having been discovered, the society broke up. Some of the members were arrested and put to death, others sought safety in flight. Among the latter was Socinus, who traveled in France, England, Holland, Germany, and Poland, making the acquaintance, and acquiring the esteem, of many transalpine scholars, and finally settled in Zürich, where he died in 1562, when only 37 years of age. Lælius Socinus, unlike most heretics, was a prudent and reticent man. His speech at least never betrayed him; but in his correspondence with his Italian relatives and friends he showed himself an ardent and eloquent disputant, and made not a few proselytes. Once, in a moment of mistaken confidence, he disclosed himself to Calvin, who grimly warned him to get rid of his "itch of inquiry," lest he should "draw on himself great torments." In the same year occurred the murder of Servetus.—See Ilgen's *Vita Lælii Socini* (Leip. 1814), and *Symbolæ ad Vitam et Doctrinam Lælii Socini* (Leip. 1826).

SOCINUS, FAUSTUS, nephew of the preceding, was the son of Alessandro Socinus, and was also born at Siena, Dec. 5, 1539. By the mother's side he was very highly connected, but having lost his parents while still young, his education was carelessly conducted; and he himself, at a later period, lamented the imperfection of his scholastic culture. His want of learning, however, only induced him to speculate the more freely, and thus it happened, partly from native bias, and partly from his uncle's epistolary arguments, that Faustus was a heretic and anti-Trinitarian before he was out of his teens. In 1559, when only 20 years of age, he found it advisable to seek an asylum in France, and was living at Lyon when he got news of his uncle's death. He immediately proceeded to Zürich, and possessed himself of his relative's MSS., after which he returned to Italy. He entered the service of the grand duke of Tuscany, and during twelve years

seemed to forget, amid the cares of office and the dissipations of a court, the thorny questions of theology. But at the expiry of that period, he was seized with a stronger desire than ever to investigate the truths of religion, and in spite of all remonstrances, proceeded to Germany—the center of theological activity. In 1574 he retired to Basel, to prosecute his studies more closely; but a disputation which he had with a certain Fr. Pucci (1578), obliged him to leave Switzerland. At the request of George Blandrata, he visited Transylvania, where anti-Trinitarians were numerous, especially among the nobles, and eagerly sought (not without success) to make converts to his opinions. In 1579 he went to Poland. Anti-Trinitarianism was even stronger there than in Transylvania, and Socinus soon obtained a great influence. He preached, and disputed, and wrote with a zeal that Socinianism has seldom displayed since. His position in relation to the reformers was, that Luther and Calvin had rendered great services to the cause of religion, but that they had not gone far enough, that the only solid basis on which Protestantism could rest was human "reason," that everything that contradicted it should be rejected as false and incredible, and that dogmas that were absurd should not be allowed to shelter themselves from criticism because their defenders chose to call them "mysteries." The Protestants were alarmed, and the ablest among them undertook publicly to confute Socinus. A disputation was held in the college of Posna, which ended in Socinus reducing all his opponents to silence; but they retaliated (after the unscrupulous fashion of the times) by trumping up against their vanquisher a charge of sedition, which, although ridiculously groundless, made it necessary for Socinus to withdraw from Cracow. While living in retirement on the estate of a Polish noble, Christopher Morszyn, he married the daughter of his protector. She seems to have been a tender and affectionate wife; and when Socinus lost her in 1587, he almost broke his heart through grief. About this period his property in Italy was confiscated; but he had powerful and wealthy friends in Poland, who proved generous to him in his needs. In 1588 he took part in the synod of Brest (on the borders of Lithuania), and combated all the principal dogmas of the church—the divinity of Christ, propitiatory sacrifice, original sin, human depravity, the servitude of the will, and justification by faith. In 1593, on the publication of his *De Jesu Christo Servatore*, his enemies stirred up the populace of Cracow against him; and Socinus was pulled from a sick-bed, and nearly murdered. Soon after, he left the city, and found a refuge with one of his friends in the village of Luclavie, where he died, Mar. 3, 1604. Socinus's works are no longer read; but his opinions have never wanted advocates in any Protestant country. He and his uncle may be regarded as precursors of that spirit of rationalism which has rooted itself so deeply in the thought of the modern world. See Przypcow's *Life of Socinus*, prefixed to a collection of his works in the *Bib. Frat. Polonorum* (Amst. 1656); Bayle's article in the *Dictionnaire*; and Toulmin's *Memoirs of the Life, Character, etc. of F. S.* (Lond. 1777).

SOCIOLOGY. See SOCIAL SCIENCE.

SOCLE, a plain plinth, forming a pedestal for the support of a statue, column, etc.

SOCORRO, a co. in New Mexico, having the state line of Arizona for its w. boundary; 15,476 sq. m.; pop. '90, 9595, chiefly of American birth. It is drained by the Rio Grande del Norte, the San Francisco, and the head-waters of the Gila. The surface is mountainous. A large proportion is unproductive, but the river banks and localities improved by irrigation produce wheat and corn. Much attention is paid to vine-culture and sheep-raising. Its mineral products are gold and iron. Co. seat, Socorro.

SO'COTRA, an island near the entrance to the gulf of Aden, 80 m. long and 30 broad. Area, about 1382 sq. miles. Pop. 10,000, of various races. The surface consists for the most part of a table-land of from 700 to 800 ft. high, but it has mountains rising to a height of 4000 ft. All the streams of the island with the exception of a few rivulets, are dry at a certain season; but rain-water is collected in reservoirs, and in most parts water can be obtained by digging a few feet below the surface. Owing to the somewhat unfertile character of the soil, most of the districts are more adapted for pasture than for agriculture; but grain, fruits, and vegetables are grown in the eastern districts. The aloe plant and the dragon's-blood tree are the chief commercial products. Socotra belongs to the sultan of Keshin, who in 1876 concluded a treaty by which in respect of Socotra, he became a feudatory of Great Britain.

SOCRATES, the celebrated Greek philosopher, was b. at Athens in the year 469 B. C. His father, Sophroniskos, was a sculptor; and he followed the same profession in the early part of his life. His mother, Phænarete, was a midwife, to which avocation he was wont to compare his own peculiar method of conversational teaching. His family was respectable in descent, but humble in point of means. His physical constitution was robust to an extraordinary degree, enabling him to endure the hardest military service, and to live his own chosen life of superiority to all wants above the barest necessities of life. While his ordinary diet was simple and abstemious, he could, on religious festivals or social occasions, drink more wine than any one else without being intoxicated. He had the usual education of an Athenian citizen, which included not only a knowledge of the mother-tongue, and readings in the Greek poets, but also the elements of arithmetic, geometry and astronomy, as then known. As a young man, he frequented the society of the physical philosopher, Archelaus (a disciple of Anaxagoras);

but the philosophers that did most to determine his own special turn of mind must have been Parmenides and "the double-tongued and all-objecting Zeno."

Excepting in connection with his philosophical career, few circumstances of his life are known. He served as a hoplite, or heavy-armed foot soldier, at the siege of Potidæa, at the battle of Delium, and at Amphipolis, and his bravery and endurance were greatly extolled by his friends. On two memorable occasions, he stood forward in political life. After the battle of Arginusæ, in 406, the ten generals in command were publicly arraigned for neglecting to obtain the bodies of the killed to receive the rites of interment. The clamor for their condemnation was so great, that the court wished to proceed in violation of the legal forms; but Socrates, as the presiding judge, firmly refused to put the question. The other occasion was during the tyranny of the Thirty, who took up the policy of compelling a number of influential citizens to take a part in their illegal murders and confiscations; but Socrates withstood them at the peril of his own life.

Somewhere about the middle period of his life, he relinquished his profession as a statuary, and gave himself up to the career that made him famous. Deservedly styled a philosopher, he neither secluded himself for study, nor opened a school for the regular instruction of pupils. He disclaimed the appellation of teacher; his practice was to talk or converse, "to prattle without end," as his enemies said. "Early in the morning, he frequented the public walks, the gymnasia for bodily training, and the schools where youths were receiving instruction; he was to be seen in the market-place at the hour when it was most crowded, among the booths and tables where goods were exposed for sale. His whole day was usually spent in this public manner. He talked with any one, young or old, rich or poor, that sought to address him, and in the hearing of all who chose to stand by. He visited all persons of interest in the city, male or female; his friendship with Aspasia is well known; and one of the most interesting chapters of Xenophon's *Memorabilia* recounts his visit to and dialogue with Theodotê—a beautiful *hetæra*, or female companion. Nothing could be more public, perpetual, and indiscriminate as to persons than his conversation; and as it was engaging, curious, and instructive to hear, certain persons made it their habit to attend him in public as companions and listeners. These men, a fluctuating body, were commonly known as his disciples or scholars, though neither he nor his personal friends ever employed the terms *teacher*, and *disciple* to describe the relation between them."—Grote's *Greece*, chap. lxviii.

Another peculiarity of Socrates was his persuasion of a special religious mission. He had been accustomed all his life to hear what he considered a divine voice, or preternatural sign, which came to him solely as a prohibition or warning, and never as an instigation to act. In deference to it, he had kept back from entering public life, and it caused him to refrain from premeditating the defense that he made on his trial. Nor was this all; relying, like his countrymen, on divine intimations by dreams and oracles, he believed that his mission had been signified to him by these. One oracular intimation in particular he described in his defense as the turning-point of his life. An admirer and friend of his, Chærephon, about the time when he began to have some repute as a wise man, consulted the oracle at Delphi as to whether any man was wiser than Socrates. The priestess replied: "None." The answer, he said, perplexed him very much; for he was conscious to himself that he possessed no wisdom on any subject, great or small. At length, he resolved to put the matter to the test by taking measure of the wisdom of other persons as compared with his own. Selecting a leading politician, accounted wise by himself and by others, he put a series of questions to him, and found his supposed wisdom was no wisdom at all. He next tried to demonstrate to the politician himself how much he was deficient; but found him impracticable on this head, refusing to be convinced. He then saw a meaning in the oracle, to the effect that his superiority to others lay not in his wisdom, but in his being fully conscious of his ignorance. He tried the same experiment on other politicians and rhetors, then on poets, and lastly on artists and artisans, and with the same result. Thereupon, he considered it as a duty imposed upon him by the Delphian god to cross-question men of all degrees as to their knowledge, to make them conscious of their ignorance, and thereby put them in the way of becoming wise. We shall see presently wherein this low view of the human intelligence differed from the contemptuous tone of a mere satirist.

The intellectual characteristics of Socrates, through which he influenced the whole subsequent course of human thought, may be stated under three heads: 1. Subject, 2. Method, and 3. Doctrine.

1. As to subject.—Here he effected a signal revolution, metaphorically expressed by the saying of Cicero, that "Socrates brought down philosophy from the heavens to the earth." The previous philosophies consisted of vast and vague speculations on nature as a whole, blending together cosmogony, astronomy, geometry, physics, metaphysics, etc. Socrates had studied these systems, and they left on his mind a feeling of emptiness and unsuitability for any human purpose. It seemed to him that men's endeavors after knowledge would be better directed to the human relationships, as involving men's practical concerns. He could not go to any public assemblage without hearing questions agitated respecting the just and unjust, the honorable and base, the expedient and hurtful; moreover, he found that the opposing disputants were, without knowing it, very confused in their ideas as to the meanings of those large words in which the weightiest interests centered. Accordingly, he was the first to proclaim that "the proper

study of mankind is man;" human nature, human duties, and human happiness made up a field of really urgent and profitable inquiry. In astronomy he saw a certain utility for navigation, and for the reckoning of time, to which extent he would have it known by pilots and watchmen; geometry was useful in its literal sense of land-measuring; arithmetic he allowed in like manner so far as practically useful; but general physics, or the speculations of philosophers, from Thales downward, as to the origin of all things, out of water, fire, air, etc., he wholly repudiated. "Do these inquirers," he asked, think that they already know *human* affairs well enough, that they thus begin to meddle with divine? Do they think that they shall be able to excite or calm the winds at pleasure, or have they no other view than to gratify an idle curiosity?" He considered it not only unprofitable but impious to attempt to comprehend that department. The gods, he thought, managed all those things after their own fashion, and refused to submit them to invariable laws of sequence, such as men might discover by dint of study; the only means of knowledge permitted was religious sacrifice and prayer, and the consultation of the oracles. While this was the appointed way in reference to divine things, it was equally appointed that human things should be learned by diligence in study and investigation.

2. In regard to method, Socrates was the author of still greater innovations. It was to little purpose that men applied themselves to human affairs, if they conceived them loosely, and with no regard to evidence. Socrates introduced at least one element of logical precision into the handling of questions, by insisting on accuracy in definition and classification. His mode will be seen in the statement of Xenophon. "Socrates continued incessantly discussing *human* affairs, investigating—What is piety? What is impiety? What is the honorable and the base? What is the just and the unjust? Men that knew these matters, he accounted good and honorable; men that were ignorant of them, he assimilated to slaves."

His investigation thus took the form of ascertaining the exact meaning—that is, the definition—of the leading terms in ethics and in politics, the settling of what J. S. Mill calls the *connotation* of a general word, which determines how to apply it rightly to each individual case. The very idea of defining a general term, now so obvious, never seems to have suggested itself to any one previous to Socrates. And his manner of seeking out those definitions is also characteristic, and links itself to his conversational method, and his convicting men in general of ignorance in things that they thought they knew. Professing himself to be able to furnish no exact definition (this professed ignorance was called the Socratic irony) of justice, temperance, courage, etc., and finding every one else quite confident in their ability to supply the want, he asked some one to state his definition; and on its being given, he put a few further interrogations (as he said) by way of making sure that he understood the meaning, but with the speedy effect of driving the respondent into a humiliating self-contradiction. His method is most fully exemplified in certain of the Platonic dialogues, as the first *Alcibiades*, *Lachés*, *Charmides*, *Euthyphron*, etc. According to Xenophon, he could pass from his severe cross-examining method, with its humiliating shock of convicted ignorance, and address to his hearers plain and homely precepts, inculcating self-control, temperance, piety, duty to parents, brotherly love, fidelity in friendship, diligence, etc.—such direct admonitory influence being common to him with the so-called sophists. He probably went beyond the ordinary teaching of the sophists in exhorting men "to limit their external wants, to be sparing in indulgence, and to cultivate, even in preference to honors and advancement, the pleasures arising from a performance of duty, as well as from self-examination and the consciousness of internal improvement." This strain of exhortation, his manner of life in harmony therewith, and the virtual self-immolation of his death, may be considered as the conjoint root of the cynic and the stoic philosophers.

As regards doctrine, Socrates was distinguished chiefly by his theory of virtue. Virtue, he said, consisted in knowledge. To do right, was the only road to happiness; and as every man sought to be happy, vice could arise only from ignorance or mistake as to the means; hence the proper corrective was an enlarged teaching of the consequences of actions.

We cannot, on any fair interpretation of knowledge, regard this as other than a one-sided view. It takes note of one condition of virtue, since there can be no right conduct without understanding the tendency of actions, or, at all events, the meaning of rules; but it omits, what is also essential, the state of the emotions or dispositions, which may be directed either to exclusively self-regarding ends, or to ends involving also the good of others. There is an obvious connection between the doctrine and the Socratic analogy of virtue to the professions. The virtue of an artisan is almost exclusively contained in his skill or knowledge; his dispositions can usually, though not always, be depended on, through the pressure of his immediate self-interest. But the practice of Socrates was larger than his theory; for, as already remarked, his exhortations were addressed to men's feelings or sentiments as well as to their intellect. His political doctrines were biased by the same analogy of special professions. The legitimate king or governor was he alone that knew how to govern well.

In the year 399 B. C., an indictment was laid against Socrates, in the following terms: "Socrates is guilty of crime: first, for not worshipping the gods whom the city worships, and for introducing new divinities of his own; next, for corrupting the youth. The

penalty due is death." The trial took place before a dikastery, or law-court, composed of citizen-judges, like our juries, but far more numerous; the number present seems to have been 557. His defense is preserved by Plato, under the title *Apology of Socrates*. The tone of it, so admirable to us, was such as to make acquittal all but impossible, from the number of enemies created by his cross-questioning annoyance of all classes of men, and from various other causes. He dwelt on his mission to convict men of ignorance for their ultimate benefit; pronounced himself a public blessing to the Athenians; declared that, if his life was preserved, he would continue in the same course; and regarded the prospect of death with utter indifference. By a majority of either five or six, the charges were declared to be proven. A vote had then to be taken on the sentence. By the Athenian practice, the accuser named a penalty, and the accused was asked to do the same; the judges were restricted to one or other of these. The accuser named death. Socrates, maintaining the same high tone, declared at first that he deserved the highest public reward; but, on the instigation of his friends, he ended by proposing a trifling fine. The court, by a majority, decided for the capital sentence. There was an accidental interval of 30 days before the execution, during which Socrates in prison conversed with his friends as usual; on the last day occurred his conversation on the immortality of the soul, referred to in the Platonic dialogue called *Phædon*. He then drank the hemlock, and passed away with the dignity and calmness becoming his past life.

"There can be no doubt," says Mr. Grote, "that the individual influence of Socrates permanently enlarged the horizon, improved the method, and multiplied the ascendant minds of the Grecian speculative world, in a manner never since paralleled. Subsequent philosophers may have had a more elaborate doctrine, and a larger number of disciples who imbibed their ideas; but none of them applied the same stimulating method with the same efficacy; none of them struck out of other minds that fire which sets light to original thought; none of them either produced in others the pains of intellectual pregnancy, or extracted from others the fresh and unborrowed offspring of a really parturient mind."—See Grote's *Greece*; Zeller's *Philos. der Griechen*.

SODA. See SODIUM.

SODA, MANUFACTURE OF. Soda, or, more correctly, carbonate of soda, occupies the chief place among our leading chemical manufactures, alike from its own importance, and also on account of its influence on other great chemical industries, such as glass-making, soap-making, bleaching, etc.

A native carbonate of soda, or rather a sesqui-carbonate, called natron (q.v.), is found in Egypt and some other parts of the world. In Hungary, several manufactories exist for the purification of a native soda found there. Formerly, most of the soda in use was extracted from certain plants; and two kinds were known in commerce under the names of barilla (q.v.) and kelp (q.v.).

But the quantity of soda got from all other sources is now insignificant in comparison with that manufactured from common salt (chloride of sodium—see SODIUM). The process was invented by a Frenchman named Leblanc, and was first made known to the world by a commission of the French republic in 1794, although dating some years earlier. It is unquestionably the most valuable discovery in the entire range of chemical manufactures; and it has been practiced for nearly ninety years without any important alteration. It is sad to think that the author of this invention reaped no benefit from it himself, but spent the last of his days in an hospital, "a wreck in fortune, health, and hope." Owing partly to the war between France and England, and partly also to the existence of a duty of £30 per ton on common salt, which continued for eight years after the close of the war, Leblanc's process was not adopted in Great Britain except on a very limited scale till 1823. After the repeal of the tax in that year, Mr. James Muspratt erected his celebrated works at Liverpool, adopted the process in its entirety, and succeeded, after overcoming many difficulties, in establishing in Great Britain a chemical manufacture which has since become the most important in the world, and for which nearly 600,000 tons of common salt are now annually required.

The object of the soda-process is to separate the sodium of the salt, and unite it with oxygen to form caustic soda, or, what is more generally done, to unite the sodium with both oxygen and carbonic acid to form carbonate of soda. The several stages of the process are as follows:

First Operation—The Production of Sulphate of Soda.—The decomposition of the common salt is effected by treating it with sulphuric acid, which transforms it into sulphate of soda and hydrochloric acid. This operation was long conducted in a common reverberatory furnace (q.v.), and the hydrochloric acid was suffered to escape into the air. Not only was the acid thus lost, but it destroyed all vegetation in the neighborhood of soda-works, and involved their owners in serious law-suits for damages. The great chimneys of the St. Rollox works, Glasgow, and Mr. Muspratt's, Liverpool, which are nearly 500 ft. high, were erected with a view of curing this evil, but they were found to be ineffectual. The most improved furnaces now in use for the purpose are built in pairs, and in the front part of each there is a shallow cast-iron pan, nine ft. in diameter, with a sheet-iron cover, and so built that the fire may act on the bottoms and sides. Behind this, an oblong brick

chamber, 30 ft. by 9 ft., is situated, with separate fire-places, and called the salt-cake furnace. Acid flues are led from each compartment of the double furnace into one main flue, which has its outlet into a condensing tower, to be presently described. Separate flues are also provided for the conveyance of smoke to a main chimney. The furnace is worked in the following way: when it is properly heated, salt to the amount of 10 cwt. is thrown in by an opening, and about 80 gallons of strong sulphuric acid are heated and run in. The mixture, which is well stirred with an iron rake, gradually thickens, and in about an hour the pasty mass, not yet all decomposed, is pushed through the opening into the salt-cake chamber. Here it is spread out on the sole, and maintained at a red heat for another hour, when the whole of the hydrochloric acid is expelled, and the conversion into sulphate of soda complete. A pair of furnaces, about one-half larger than those above described, will produce about 19 tons of sulphate of soda in a day, for which 16 tons of common salt are required. At the St. Rollox chemical works, Glasgow, about 500 tons of common salt are decomposed weekly.

A very important part of this operation is the condensation of the hydrochloric acid gas, which is disengaged in large volumes during the decomposition of the salt. As already stated, it was formerly allowed to escape into the atmosphere. The acid flues convey it to the condensing towers, which are generally filled with pieces of burnt coke, through which a supply of water is kept running. The gas enters at the bottom of the first tower, passes upward, and descends the second, and is gradually absorbed by the water, forming strong liquid acid, which is run out by openings at the bottom of the condenser. So perfect is the system of condensation now in use at some works, that of the acid produced by 100 tons of pure chloride of sodium which should yield 62 tons, as much as 58½ tons have actually been collected; and it has been instanced, as a curious illustration of this in another way, that Mr. Muspratt's great works, which were at one time forced out of Liverpool as a nuisance, have been established there again without causing any protest. Nevertheless such works being still considered obnoxious to their neighbors, an "alkali act" was passed by parliament in July, 1863, "For the more effectual condensation of muriatic (hydrochloric) acid gas in alkali works." It compels every manufacturer of alkali to secure the condensation of not less than 95 per cent. of the muriatic gas evolved in his works, under a penalty not exceeding £50. This act was amended in 1874 by which copper and sulphuric acid works were placed under similar restrictions. The hydrochloric acid obtained in this process is mostly used in the manufacture of bleaching-powder.

Second Operation—The Conversion of the Sulphate of Soda into Black-ash, called also Ball-soda.—This is effected by heating a mixture of sulphate of soda, carbonate of lime, and coal, in a reverberatory furnace. The proportions now used are the same as those first recommended by Leblanc—viz., sulphate of soda, 100 parts; carbonate of lime, 100 parts; carbon (charcoal), 55 parts. But as coal is employed in England instead of charcoal, the quantity used is generally 75 to 100 of each of the other two ingredients. The "balling furnace" used in this operation has two beds, the one being raised a few inches above the other. The waste heat from the fire-place is usually employed in boiling down the soda-lye. The charge is thrown into the bed of the balling furnace away from the fire-place after it has been raised to a bright red heat, and remains till it becomes sufficiently heated throughout the whole mass. It is then transferred to the *fluxing bed*, which is next the fire, and exposed to a higher heat, when it shortly begins to soften and flux into a mass like dough. In about half an hour the charge is withdrawn in a red-hot state by the working door, and received into iron barrows, where it solidifies into blocks of crude soda termed ball-soda, or black-ash. A new kind of balling furnace, first introduced at the Jarrow Chemical works, South Shields, is now becoming extensively used. It differs from the one described in having that portion of it for receiving the mixture of sulphate of soda, coal, and lime in the form of a brick-lined iron cylinder, large enough in some instances to decompose 50 tons of the sulphate in 24 hours. This cylinder lies in a horizontal position, and is made to revolve slowly by engine-power. The materials are introduced by means of a hopper; the fire-place, which does not rotate, is placed at one end of the cylinder; and the arrangement for evaporating the lye is somewhat similar to that employed in the furnace described. This rotary furnace admits of the work being much better done than by the older reverberatory furnace, as it not only saves labor, but prevents loss of soda by volatilization.

In this process there is first a reduction of sulphate of soda to sulphide of sodium with evolution of carbonic acid; then a conversion of the sulphide of sodium and carbonate of lime into carbonate of soda and sulphide of calcium; and finally the excess of carbonate of lime is reduced by the carbon to caustic lime and carbonic oxide.

Third Operation—The Preparation of Carbonate of Soda from the Black-ash, by Lixiviation and Evaporation.—For some purposes the crude soda, or black-ash, is used without further purification; for example, in the making of soap. Its lixiviation is effected by the use of a series of iron tanks, or vats, into which it is placed with water. Several tanks, each of the capacity of 600 gallons, rise above one another in successive stages, so that the liquor of the highest can be run into the next lower, and so on. The black-ash is introduced fresh into the lowest vat; it then passes from vat to vat, and is taken away exhausted at the highest one. The water, on the contrary, comes in fresh at the

top, and in passing downward encounters less exhausted ash in each succeeding vat, and finally passes away from the lowest a fully saturated solution. In most soda-works, the vats are now arranged differently, although the ash may be said to be exhausted in the same way. In the new arrangement, the vats are placed horizontally, and advantage is taken of the fact that solutions in becoming richer become also heavier, so that, although the tanks are all on a level, the water runs through them with what is virtually a downward flow. We have not space to describe minutely this very elegant and economical plan; it will be enough to say that it completely obviates the necessity of lifting the ash from vat to vat, because any two contiguous ones can be made at pleasure the highest and lowest points, and, therefore, those of ingress and egress for the lixiviating fluid. "Each vat, in due rotation, is emptied and refilled; and thus each in turn successively occupies the highest, lowest, and all intermediate points of the declivity."

The next stage is the evaporation of the soda-lye, which is conducted in a variety of ways. A common method consists in using the waste heat of the balling furnace, the flame from which passes over the surface of the liquor. With proper manipulation the soda falls to the bottom, and is raked out at intervals through a side-door, and drained upon a sloping surface.

The soda-salts (chiefly carbonate of soda), thus obtained by evaporation of the lye, contain caustic soda, which requires to be carbonated, and a little sulphide of sodium, which it is necessary to get rid of. They are accordingly transferred to a reverberatory furnace, and calcined, at a moderate heat, along with sawdust, or sometimes with small coal, the mixture being stirred with iron paddles. By this treatment, the caustic soda is converted into carbonate of soda, the sulphur is mostly expelled, and we now obtain the *soda-ash*, or alkali of commerce, which generally contains about 50 per cent. of real soda, Na_2O ; the other ingredients, besides the carbonic acid with which it is combined, being chiefly water, sulphur, and common salt. Sometimes it is further purified, and it is then known as *white alkali*.

Soda crystals, or what is commonly called "washing-soda," are obtained by dissolving the soda-ash in hot water, then filtering the solution and boiling it till the specific gravity reaches 1.3, when it is transferred to the crystallizing coolers. Bars of wood or iron are laid across these vessels to sustain the mass of crystals which form, and in ten days at most the crystallization is complete. Crystals of soda are purer than soda-ash, but they are of much less value, weight for weight, because of the large quantity of water which enters into their constitution, amounting to $62\frac{1}{2}$ per cent.

The manufacture of caustic-soda is now an important branch of the alkali trade. For soap-making, bleaching, and several other purposes, carbonate of soda requires to be rendered caustic by quicklime. Manufacturers have, accordingly, taken to the plan of treating the black-ash liquor with hydrate of lime, and so obtain caustic-soda at this stage, instead of sending it into the market as a purified carbonate of soda, for purposes where it requires to be decarbonated again. Another plan consists in mixing a small quantity of chloride of lime, or nitrate of soda, with the soda-lye from the black-ash. It is then concentrated into a strong solution, and finally brought to the state of a fused mass in round iron pots heated to redness. Great attention is now given to the recovery of sulphur from the enormous "waste heaps" which accumulate at all large alkali works, since there is fully a ton of this "waste" produced for every ton of common salt used. It consists largely of noxious sulphides of calcium, and is a source both of river and, in warm weather especially, of atmospheric pollution. Mond's process, or some modification of it, is usually adopted. Some chemical changes are first produced in the waste by the action of common air, and the sulphur afterward precipitated by hydrochloric acid.

Various processes have been at different times proposed, and many have been patented, for making carbonate of soda by other methods than that of Leblanc; but only one of these has had any measure of success. We allude to what is called the "ammonia process," patented by Dyer & Hemming in 1838. Several improvements—some of them quite recent—have been made on the original method, and the process is now worked on the large scale at Northwich in Cheshire, and at several places on the continent. It consists in treating a solution of common salt with bicarbonate of ammonia, by which bicarbonate of soda is produced, and the chloride of ammonium remains in solution.

Sulphate of soda is made at Widnes, in Lancashire, by Mr. Hargreaves's process of decomposing bricks of common salt with sulphurous acid and steam. This method, by avoiding the direct use of sulphuric acid, saves the expense of nitrate of soda; and there is also a saving in the wear and tear of apparatus, owing to the lower temperature required. See LOMIS, *Manual of the Alkali Trade*, 1880.

SODA-WATER. See AERATED WATERS; SODIUM.

SÖDERMANLAND, a province of s.e. Sweden, bounded n. by lake Maelar, s.e. by the Baltic; 2631 sq.m.; pop. '95, 161,722. The surface is level. The soil is fertile. Agriculture and fishing are the chief occupations. Capital, Nyköping.

SODIUM (symb. **Na**, equiv. 23, spec. grav. 0.972), is one of the metals of the alkalis—its oxide being soda. Its properties closely resemble those of the allied metal, potassium. It is of a bluish-white color, is somewhat more volatile than potassium, and further differs from that metal in having a higher fusing-point, 203.9° F. (95.6° C.), a greater specific gravity, and in not catching fire when dropped in water (unless the water is heated), although like potassium under similar conditions, it partially decomposes it and liberates hydrogen; and at the same time communicates a strong alkaline reaction to the solution. If, however, a piece of unsized paper is placed on the surface of cold water, and the sodium be placed on the paper, the metal takes fire, and burns with a deep yellow flame. Strictly speaking it is the liberated hydrogen rather than the metal which burns, the yellow tint (which is characteristic of the sodium compounds) being due to a little sodium volatilized by the heat, mixing and burning with the hydrogen. When heated in the air, it burns with its characteristic yellow flame, and is converted into soda. When exposed *in vacuo* to a red heat it assumes the form of vapor, and admits of distillation. Like potassium, it must be kept immersed in naphtha, so as to exclude the oxidizing action of the air. As a reducing agent, it is little inferior to potassium, and as its combining power is lower, and it is obtained much more cheaply, it may usually be advantageously substituted for potassium in reducing operations. Sodium does not occur in the metallic form in nature, but its compounds are very widely distributed. It is found by far the most abundantly in the form of chloride of sodium (or common salt), but it likewise occurs as albite or soda-feldspar, cryolite (the double fluoride of sodium and aluminium, and the principal source from whence aluminium is procured), borax (the baborate of soda), trona (the sesquicarbonate of soda), and Chili saltpeter (nitrate of soda).

The methods of obtaining sodium are similar to those already described for obtaining potassium. The following procedure recommended by Deville is regarded as the best for obtaining it in large quantity. Intimately mix 717 parts of dried carbonate of soda with 175 parts of finely powdered charcoal and 108 parts of finely ground chalk, knead them into a stiff paste with oil, heat them in a covered iron pot till the oil is decomposed, and finally distil them in an iron retort with the precautions which are noticed in describing the preparation of potassium (q.v.). The object of adding the chalk is to prevent the separation of the charcoal from the carbonate of soda when the latter fuses. This mixture ought to yield nearly one-third of its weight of sodium.

With regard to the history of sodium, it is sufficient to observe that Duhamel, in 1736, discovered that potash and soda (now known to be the oxides of potassium and sodium) were distinct bodies. Sir H. Davy first obtained the metal *sodium* in 1807. The symbol of this metal, **Na**, is the abbreviation of *natrimum*, which is derived from *natron*, one of the old names of native carbonate of soda.

Sodium combines with all the elementary gaseous bodies, and two of these combinations—viz., those with oxygen and chlorine, are of extreme importance and value.

With *oxygen*, sodium forms two compounds—viz., an oxide, Na_2O , and a peroxide Na_2O_2 . The latter being of no practical value, may be passed over without notice. The oxide (soda) was formerly known as *fossil* or *mineral alkali*, to distinguish it from potash, which, from the source from which it was procured, was termed *vegetable alkali*. Anhydrous soda, Na_2O , is procured by burning the metal in dry air; it is of a yellowish-white color, powerfully attracts moisture, and retains the water so firmly that it cannot be expelled by heat. Hydrated or caustic soda, NaOH , closely resembles, both in its properties and in the mode of procuring it, the corresponding potash compound. It is, however, not so fusible as the latter, and is gradually converted, by exposure to the air, into carbonate of soda, which in its anhydrous state is also less fusible than the potassium carbonate. Solution of hydrate of soda (or soda lye) is largely employed in the arts. It is prepared by boiling a tolerably strong solution of carbonate of soda with milk of lime until a portion of the filtrate ceases to effervesce on the addition of an acid. The solid hydrate has a specific gravity of 2.13, and the quantity of anhydrous soda in any solution may be pretty closely approximated to by determining the specific gravity of the fluid at a temperature of 59° F. (15° C.). Tables for this purpose have been constructed by Dalton (quoted in Miller's *Inorganic Chemistry*, 2d ed., p. 37), and by Zimmerman (reprinted in the article "Sodium" in Knight's *English Cyclopædia*).

Many of the combinations of the oxide of sodium (soda) with acids—constituting soda salts—are of great importance. Carbonic acid forms three salts with soda—viz., a normal carbonate, a sesqui-carbonate, and a bicarbonate of soda.

The *normal* or *ordinary carbonate of soda*, or *sodium carbonate*, $\text{Na}_2\text{CO}_3 + 10\text{H}_2\text{O}$, popularly known as the *soda* of commerce, is a colorless, inodorous salt, with a nauseous alkaline taste. It crystallizes in large transparent rhomboidal prisms, which contain nearly 63 per cent. of water, but it readily parts with all this water on the application of heat. The crystals also lose the greater part of their water on mere exposure to the air, when they effloresce and fall to powder. Water at 60° F. dissolves half its weight of the crystals, and boiling water considerably more, the solution acting like an alkali on vegetable colors. This salt occurs native in the natron-lakes of Hungary, Armenia, etc., in association with sulphate of soda and chloride of sodium. In other regions it appears in an efflorescent form on the surface of the earth. It is now, however, almost entirely manufactured from sea-salt. See SODA, MANUFACTURE OF.

Sesquicarbonate of soda, $\text{Na}_2\text{CO}_3 + 2\text{NaHCO}_3 + 3\text{H}_2\text{O}$, occurs native in the form of large, hard, non-efflorescent prisms, in Hungary, Egypt, Mexico, etc., under the name of *trona* or *natron*. When strongly heated, it loses one third of its carbonic acid, and becomes converted into the preceding salt. As its formula shows, it is not a true single carbonate, but a mixture of the normal and the acid carbonate.

Bicarbonate of soda, or *acid sodium carbonate*, NaHCO_3 , may be formed by passing a current of carbonic acid through a strong solution of carbonate of soda, till saturation takes place, and allowing the mixture to crystallize; or it may be produced on a large scale by exposing crystals of carbonate of soda to a prolonged current of carbonic acid. The bicarbonate crystallizes in four-sided prisms, which require 10 parts of water at an ordinary temperature for their solution. This salt is used largely in medicine. See AERATED WATERS.

Sulphuric acid forms with soda a normal and an acid sulphate.

The *normal or ordinary sulphate of soda*, $\text{Na}_2\text{SO}_4 + 10\text{H}_2\text{O}$, has been already described under its synonym of *Glauber's salt* (q.v.). The acid salt, or *bisulphate* of soda, NaHSO_4 , is of no special interest.

The *hyposulphite of soda*, $\text{Na}_2\text{S}_2\text{O}_3 + 5\text{H}_2\text{O}$, occurs in large, colorless, striated rhombic prisms, of a cooling and sweet taste. When strongly heated in the air, it burns with a blue flame. It dissolves readily in water, depositing sulphur if the solution be kept in a closed vessel. It may be obtained by digesting powdered sulphur in a solution of sulphite of soda. The sulphur is gradually dissolved, and forms a colorless solution, which, on evaporation, yields crystals of hyposulphite of soda. This salt is largely employed in photography, and is occasionally prescribed medicinally. Sulphurous acid forms two salts with soda—viz., a sulphite and a bisulphite. The *sulphite of soda*, $\text{Na}_2\text{SO}_3 + 7\text{H}_2\text{O}$, is obtained by passing sulphurous acid over carbonate of soda, dissolving the resulting mass in water, and crystallizing; when the salt is obtained in efflorescent oblique prisms, which fuse at 113°F ., and are soluble in 4 parts of cold water, the solution having a slightly alkaline reaction, and a sulphurous taste. This compound is commercially known as *antichlore*, and is largely used in paper-manufactories for the purpose of removing the last trace of chlorine from the bleached rag-pulp. The *bisulphite* is of no importance. *Nitrate of soda*, NaNO_3 , known also as *cubic niter* or *Chili salt-peter*, occurs as a natural product on the surface of the soil of certain South American districts. In most of its properties, excepting its crystalline form, and further in its being deliquescent, it resembles nitrate of potash. It is used to a considerable extent as a manure. The *phosphates of soda*, though comparatively numerous, do not call for notice here. See PHOSPHATES. *Hypochlorite of soda*, NaClO , is at present only known in solution, in which it occurs as a yellowish-green fluid, evolving a smell of chlorine; it has strong bleaching power, and, when boiled, becomes decolorized, and evolves chlorine freely. It is formed by passing a stream of chlorine gas through a solution of carbonate of soda, the resulting solution containing the hypochlorite, together with undecomposed carbonate of soda and chloride of sodium. This solution is useful as a bleaching agent, as an oxidizing agent in analytical chemistry, and as a disinfectant agent. There are two *borates of soda*, of which the only important one, the *biborate*, is already described under its ordinary name of *borax* (q.v.). Various *silicates of soda* have been formed. In reference to the properties of these salts, see the articles FUCHS'S SOLUBLE GLASS; GLASS.

The *haloid salts* of sodium resemble, in their general characters, the corresponding salts of potash. Of these by far the most important is *chloride of sodium* or *common salt*, formerly known as *muriate of soda*, NaCl . It occurs naturally in far greater quantity than any other soluble salt. See ROCK-SALT, SEA, WATER. The following are its leading properties: It crystallizes in colorless, transparent cubes, which are anhydrous, soluble in about 3 parts of cold water, and scarcely more soluble in boiling water. A saturated solution has a specific gravity of 1.205, the specific gravity of the salt being 2.125. It is insoluble in pure alcohol, is inodorous, and has a purely saline taste, unmingled with bitterness, unless chloride of magnesium be mixed with it. At a red heat it fuses, and becomes converted into a transparent brittle mass. The well-known decrepitation which occurs when salt is thrown on the fire, or otherwise strongly heated, results from the sudden expansion of water mechanically entangled among its particles. The uses of this salt have been known from the earliest times. It is an essential constituent of the food both of man and animals. From want of space we must refer our readers to Liebig's *Letters on Chemistry* (Letter xxviii.) on this subject, in which the functions of salt in the food and in the blood are clearly pointed out. It is regarded as a necessity even by the rudest nations. "In several countries of Africa men are sold for salt; among the Gallas and on the coast of Sierra Leone the brother sells his sister the husband his wife, and parents their children, for salt; in the district of Accra (Gold coast), a handful of salt, the most valuable merchandise after gold, will purchase one, or even two slaves."—Note to Liebig's *op. cit.*, p. 413. Chloride of sodium is employed in the process of salting meat in consequence of its powerful antiseptic properties. Meat thus prepared loses, however, a considerable portion of its nutritive juices, which pass into the brine, and is less digestible than in its natural state. Among the purposes for which this salt is mainly employed may be mentioned the manufacture of the various salts of soda, especially the carbonate; the preparation of hydrochloric acid; the glazing of stoneware; the preparation of soap, etc. The other haloid salts—the iodide, bromide, and fluoride of sodium—require no notice.

Sodium has been recently found to enter into various groups of organic bodies. We shall take the sodium-alcohols as an example. When sodium or potassium is gradually added to anhydrous alcohol, the temperature rapidly rises, the metal is dissolved, hydrogen is evolved, and a fusible deliquescent compound is formed, which has received the name of *sodium-alcohol* (or potassium-alcohol), or of *ethylate of soda* (or potash), its composition being such that it may be regarded as alcohol in which one atom of hydrogen is replaced by one of the metal; as shown in the equation:

The action of sodium or potassium on the other alcohols is of an analogous nature.

The tests for the salts of sodium are not very satisfactory, because the metal forms scarcely any insoluble compounds. A salt of sodium is usually concluded to be present when, the absence of all other bases having been proved, a saline residue remains, which, with tetrachloride of platinum, yields yellow striated prisms, $2\text{NaCl} \cdot \text{PtCl}_4$, by spontaneous evaporation. Before the blowpipe the salts of sodium are known by the intense yellow which they communicate to the outer flame, and if a weak alcoholic solution of one of the salts is burned, a similar yellow tint is communicated to the flame. Spectrum analysis is too delicate to be of much practical use. Bunsen estimates the amount of soda that may be thus detected at the 195,000,000th part of a grain; and considering how universally diffused chloride of sodium is, this fractional amount is hardly likely to be absent.

In conclusion, the *medicinal uses* of the sodium compounds require our notice. They will be considered alphabetically. *Acetate of soda* is a mild diuretic, similar in operation to acetate of potash, for which it may be substituted. It may be given in doses varying from a scruple to a couple of drams. *Arseniate of soda*, Na_2HASO_4 , is serviceable in periodic affections, chronic skin-diseases, and the cases in which arsenic is generally employed in medicine. It has all the advantages of arsenite of potash, and seems to cause less irritation of the stomach. It is best given in the form of *Pearson's solution*, which consists of 1 grain of the crystals of this salt dissolved in 10 drams of distilled water. Dose, from 20 minims very gradually increased to 2 drams, 3 times daily. The *liquor soda arseniatis* of the pharmacopoeia is much stronger; its dose being from 3 to 10 minims. Paper impregnated with a solution of arseniate of soda sweetened with sugar is sold as a poison for flies. *Biborate of soda*, or *borax*, is employed principally as a tropical astringent, and is used with advantage in aphthous eruptions of the mouth and throat. *Bicarbonate of soda* is a most popular remedy in cases of dyspepsia, but its use is highly injurious when there are phosphatic deposits in the urine. See PHOSPHATIC DIATHESIS. Neligan strongly recommends the external application of an ointment consisting of 20 or 30 grains of the bicarbonate, with an ounce of cold cream, in cases of papular and vesicular eruption of the scalp. *Carbonate of soda* is not employed as an antacid so frequently as the bicarbonate, in consequence of its disagreeable taste; but in the dried state, when deprived by heat of its water of crystallization, it is much used as an alternative. In dyspepsia attended with acidity, a combination of the dried carbonate with blue pill and rhubarb pill is often extremely useful. As it has a very acrid taste, it should be combined, if given in powder, with some bland substance, such as compound tragacanth powder. *Solution of chlorinated soda* (known also as *solution of chloride of soda*, *chlorinated soda*, *hypochlorite of soda*, and *Labarraque's disinfecting liquor*) is preferable to hypochlorite of lime in destroying noxious effluvia, as the salt which is left does not deliquesce, while chloride of calcium is very deliquescent. It may be applied locally to foul ulcers, either in lotion (2 drams to 8 ounces of water), or as a poultice with linseed meal and boiling water. *Phosphate of soda*, $\text{Na}_2\text{HPO}_4 + 12\text{H}_2\text{O}$, known also as *tasteless purging salts*, is a mild saline purgative, with a far less unpleasant taste than sulphate of magnesia. It is especially adapted as a purgative for persons affected with deposits of red gravel (lithic or uric acid) in the urine. The dose varies from half an ounce to 2 ounces, and it may be given in broth, to which it imparts only a saline taste. *Sulphate of soda*, and *tartrate of soda and potash*, have been already described under their ordinary names of *Glauber's salt* (q.v.) and *Rochelle salt* (q.v.).

SODOM, APPLE OF, the name given to the fruit of a species of *solanum* (q.v.). But it seems that the true APPLE OF SODOM, or MAD APPLE, of the shores of the Dead sea, mentioned by Strabo, Tacitus, and Josephus, and described as beautiful to the eye, but filling the mouth with bitter ashes if tasted, is a kind of gall, growing on dwarf oaks, and produced by a species of gall-insect, which has received the name of *cynips insana*. These galls are about 2 in. long, and $1\frac{1}{2}$ in. in diameter, of a beautiful, rich, glossy, purplish-red color, and filled with an intensely bitter, porous, and easily pulverized substance, surrounding the insect. They are attached to the twigs in a curious manner, different from other galls, the narrow end "rising upward on each side, and bending inward, so as to clasp the extremity of the twig somewhat like a pair of wide and curved nippers."

SODOM AND GOMOR'RAH, two ancient cities of Syria, almost invariably spoken of in conjunction in the Bible, and forming with Admah, Zeboiim, and other towns, the "cities of the plain," which on account of the enormous wickedness of their inhabitants (the nature of which is indicated in the term sodomy), are said to have been overthrown—not submerged—by some terrible convulsion of nature. Modern writers on sacred topography are not agreed as to the precise site to be assigned to these cities, no trace of which now remains; the majority holding that they stood on the southern shore of the Dead sea, near the salt hill of Usdum; while others, again, apparently with more countenance from the Scripture narrative (Gen. xiii. 10-13) maintain that Sodom, Gemorrah, and the other "cities of the plain," stood in the "circle or plain of the Jordan," e. from Bethel and Ai, near where the river discharges itself into the Dead sea. The popular belief, that the cities were miraculously overwhelmed by the waters of the Dead sea, and that their remains may still be seen at the bottom, is an idle tale of superstitious travelers, uncoun tenanced either by fact or by the terms employed by Scripture to describe the catastrophe.

SODOMY, an unnatural crime, is punishable with penal servitude for life, or any term not less than ten years, and the attempt to commit it is punishable with penal servitude from three to ten years. In Scotland it is still nominally a capital offense, but never punished except by penal servitude and imprisonment.

SODOR AND MAN, BISHOPRIC OF. See **HEBRIDES** and **MAN**.

SOEST (pronounced SOHST), a t. of Prussia, province of Westphalia, 34 m. s.e. of Münster by railway, was, during the middle ages, a Hanse-town and fortress, and, in point of commercial importance, one of the foremost cities of Germany, with a pop. of from 60,000 to 70,000. Now, however, it is only the shadow of its former self; but relics of its ancient splendors still survive in its numerous and magnificent churches, of which the finest is the "meadow church," restored in 1850. Its municipal law, the *jus susatense*, was the oldest in Germany, and served as the model for the other imperial free-towns, Lübeck, Hamburg, etc. At present Soest has some trade in corn, and a number of manufactories and breweries. Pop. '95, 15,407.

SOFA LA, or, as the old geographers sometimes wrote it, **CEFOLA**, is the name given rather indefinitely to that portion of the s.e. coast of Africa extending from the delta of the Zambezi (Quama of old geographers) as far s. as the Rio Maneci or Delagoa bay, or from lat. 18° to 26° s., although some modern geographers consider cape Corrientes as its southern limit. This stretch of coast now comprehends the Portuguese captaincies of Rio de Senna, Tetè, Sofala, and Inhambane, besides the regions round Delagoa bay, nominally under the control of the crown of Portugal, the extent inland being generally limited by the mountain region which runs parallel to the coast of southern Africa, and forming a belt of low country about 150 m. wide, full of swamps, densely wooded, and generally unfavorable to European life.

Sofala, in common with the remainder of the coast of eastern Africa, was conquered by the Arabs between the 8th and 12th c.; it was visited in 1480 by Pedroa Cavalho, a Portuguese captain, from Abyssinia, before the route by sea to India was discovered. In 1500 the Portuguese, under Albuquerque, commenced making settlements on this coast, and built a strong fort on an island in the mouth of the Rio de Sofala, near a town which was founded 200 years before by the Arabs, and which still exists, although in a very decayed state. The inland region at the back of the coast district, now occupied by the Transvaal Boers toward the s., or by Moselikatse and his Amatabele to the n., and stretching away northward for an indefinite distance, formed the celebrated though mythical empire of Monomotapa, the accounts of which by the early travelers are perfectly marvelous. Sofala was considered by the old geographers as a very rich, gold-producing country, and was judged by some to be the Golden Ophir to which king Solomon every three years sent a fleet of ships; and, indeed, it seems to have derived its name from the Greek *sophira*, by which Ophir is translated in the Septuagint. Lopez tells us that in his time the inhabitants related that the gold-mines of Sofala afford yearly two millions of metrigals—every metrigal accounted for a ducat. Whatever may have been its former reputation, Sofala has long ceased to be a gold-producing country to any considerable extent.

An old writer says: "Great wild elephants overspread the country, which the natives neither know how to tame nor manage; nor are lions, bears, stags, or harts and boars fewer; besides, sea-horses sport themselves in the Quama." This description is pretty accurate, even at the present day, if we omit the bears, and call the stags antelopes; for the elephants, rhinoceroses, and other large game, driven away from the highlands in the interior by the pursuit of the cape hunters, have descended into the coast lowlands, where the dense bushy nature of the country, and its extreme unhealthiness, protect them from extermination, although such keen sportsmen as McCabe, Chapman, and Edwards have not feared to follow them there.

The most northern regions of Sofala are the captaincies of Rio de Senna and Tetè, formerly called Matuka, which include the country on the right bank of the Zambezi, sloping down from the Malappo mountains, which bound its basin on the south. The principal places are Tetè, in lat. 16° 12' s., long. 31° 50' e.; and Senna, in lat. 17° 30', long. 34° 40'. The middle region comprises the captaincy of Sofala, the seat of government

being at the town or fort of that name, in the bay of Massangane; lat. 20° 12', long. 34° 40'. Inhambane is the name of the most southerly captaincy, in lat. 23° 51', and long. 35° 20'. There are other inconsiderable Portuguese factories along the coast of Inhambana, s. of Inhambane, Mambone, and Lorenzo Marquez, in Delagoa bay, where a Portuguese governor resides.

Although nominally under Portuguese rule, yet the authority of that government rarely extends outside of the walls of the miserable forts held by its agents. It is computed that on the whole of the Portuguese settlements on the e. coast of Africa there are not more than 500 colonists of European birth. Trading-parties of Dutch Boers from the Transvaal territory occasionally visit the factories of Inhambane, Sofala, and Lorenzo Marquez, to purchase articles of European manufacture in exchange for ivory, wax, timber, etc. The natives, generally, are of the negro type, gradually approximating to the more intellectual Zulu Kaffir as we proceed from the Zambezi to Delagoa bay.

The principal exports from this region are ivory, beeswax, hides, and rhinoceroses' horns, while a considerable clandestine traffic is said to be carried on in slaves. Considerable amounts of gunpowder, lead, coffee, and European clothes find their way up from the coast to the Boer settlements in the highlands of the interior. The coast-line is generally low and sandy, and dangerous on account of shoals and sand-banks. A group of islands, called Bazaruta, lie off the coast n. of cape St. Sebastian, in lat. 22° s. The best harbor is that of Inhambane, and ships may ascend to the town, about 8 m. from the mouth of the river. The harbor at the mouth of the Rio de Sofala is difficult of access on account of its bar.

SOFFIT, a small ceiling, formed into panels, as over windows, ingoings of doors, staircases, etc.

SOFIA. See **SOPHIA**.

SOFTAS, in the early days of Mohammedism, were paupers, who loitered about the mosques and had benches outside on which they slept, from which circumstance they were called *softas*, "men of the bench." In time the term came to be applied to all attached to the mosques, and in particular to the students of the higher theological branches, thus resembling the body of "fellows" of an English college. They exercise great political influence over the fanatical lower classes. There are now about 16,000 of the softas.

SOFTENING AND INDURATION are terms used to express a pathological diminution and augmentation of the consistence of the tissues or organs of the body. These changes may arise from inflammatory action; but softening may also be induced by causes totally distinct from inflammation, as, for example, from a deficient supply of blood, from scrofula or cancer, or from long-continued functional inactivity (as in the case of paralyzed muscles). Among the parts liable to both softening and induration are the brain and spinal cord, the heart, the lungs, the serous and mucous membranes, the liver, the spleen, the kidneys, the uterus, and the bones and cartilages.

SOFT-GRASS, *Holcus*, a genus of grasses having a lax panicle, two-flowered spikelets, with two nearly equal glumes. The species are not numerous. The English name is derived from the soft and abundant pubescence of the British species, which are two in number—**CREEPING S.** (*H. mollis*), and **WOOLY S.** or **MEADOW S.** (*H. lanatus*), both perennial grasses and both very common. Meadow S. is found most abundantly on damp, moorish, or peaty soils, on which it is sometimes sown, as it yields abundant herbage; but it is very inferior to some other grasses, and therefore unsuitable for rich meadows and pastures. Creeping S. is generally found on dry, sandy, or other light soils, and very much resembles meadow S., but is still more downy and of smaller size. The roots sometimes extend 5 or 6 ft. in a season. The roots contain much nutritious matter, and are a very acceptable food to horses and cattle, but especially to hogs, which grub them up for themselves when they have opportunity.

SOGDIA'NA, in ancient geography, a country in Asia, bounded on the n. by the Jaxartes, which divided it from Scythia; on the s.w. by the Oxus, which divided it from Bactria; and on the n.w. by the sea of Aral. It was conquered by the Persians in the reign of Cyrus; was invaded by Alexander, after whose time it fell into the power of Syria.

SOHAR', a t. on the sea of Oman, in Oman, Arabia; capital of the province of Batina; pop. 4,000-5,000. It is defended by a wall, and has a castle. Woolen stuffs, carpets, fire-arms, and silk are the chief manufactures, and there is some working of gold and silver. Its trade has been taken away by Muscat.

SOHN, KARL FERDINAND, 1805-67; b. Berlin, Prussia; studied art at the Berlin academy, at Düsseldorf, and in Italy. He painted a large number of pictures, all noted for the rich coloring of the female figures. Among the best were "The Two Leonoras;" "Romeo and Juliet;" "The Lute Player;" and "The Four Seasons." From 1838 to 1856 he was professor at the Düsseldorf art academy.

SOIGNIES, a t. of Belgium, province of Hainault, 22 m. s.w. of Brussels by railway. Its church of St. Vincent Maldegairre, founded in the 10th c., if not earlier, is probably the oldest in Belgium. Soignies has flax-spinning and bleach-works, trade in stone and lime, and large fairs. Pop. '94, 9245.—Some m. to the n.e., in the province of South Brabant,

lies the forest of Soignies, at whose southern extremity is situated the famous field of Waterloo.

SOILS consist of the disintegrated materials of the hard crust of the earth, mixed with decayed vegetable matter. This disintegration is effected partly by the chemical action of oxygen, carbonic acid, and the other acid or alkaline substances brought by the atmosphere to bear upon rocks, and partly by the wearing action of water in a fluid state or in the form of glaciers, or by its bursting force when frozen in deep clefts. The soils produced by running water, floods, and tides, are found along the banks or at the mouths of rivers, and are generally called *alluvial soils*; those produced by glacier action are known as *drift soils*; and both are generally found at a great distance from the rocks of whose disintegrated materials they are composed. But by far the greater mass of soil has been produced in the other way above mentioned, by the gradual weathering of rock under atmospheric influence; and it is generally found adjoining or overlying the rocks from which it has been produced. Immediately beneath the soil or stratum of earth which affords nourishment to plants, is a mass of earth or rock, unmixed with decayed vegetable matter, to which the term *subsoil* is applied. The subsoil may or may not be similar in its geological constitution to the soil; and from the absence of vegetable matter, is generally lighter in color than the latter.

Every species of rock has produced its soil; but the older formations, from their greater hardness and power of resistance to atmospheric action, produce, in proportion to their exposed surface, less soil than do the secondary and tertiary groups. The fertility of soils has no relation to the chronological succession of the strata of the earth's crust; thus, igneous rocks produce a naturally fertile soil, though they seldom become thoroughly disintegrated; metamorphic or transition rocks furnish one of poor quality, as does also the greater portion of the Silurian system; while to the vast mass of the secondary group of deposits, especially the Devonian system, with its old red sandstone, and limestone, and marl beds, the mountain limestone of the carboniferous system, and the new red sandstone of the Permian and triassic systems, belong some of the richest tracts in Great Britain, though numerous members of the same group supply barren and ungrateful soils. The lias, and oolitic, and wealden systems generally supply clay-soils of considerable fertility, but of the densest texture and most intractable character; soils formed from the cretaceous group are extremely variable in quality; but when the chalk is largely mixed with sand or clay, they exhibit a considerable degree of fertility; however, they have one great general defect, that of not sufficiently retaining moisture. The soils produced from the tertiary formations possess no general characteristics, being sometimes extremely fertile, and again almost wholly barren.

But however soils may vary in a geological point of view, they are all resolvable into a few elements—viz., the various compounds of aluminium, iron, manganese, the four alkaline metals, the seven alkaline earths, and the four organic elementary substances. These eighteen bodies supply, singly or in combination, all the constituents necessary to the growth of plants, each of them having its own portion of the plant to sustain—the silica producing strength and rigidity in the stems; alumina giving tenacity to the soil, and so rendering it a stable support; magnesia perfecting the seeds; iron absorbing oxygen and ammonia from the atmosphere, and giving it up as required; and so on. Of these ingredients, silica, alumina, lime, along with matter derived from organic bodies, constitute the bulk of the soil; the other ingredients existing only in minute quantity, and hence is derived the common quadruple division of soils into *siliceous or sandy, argillaceous or clayey, calcareous, and humous*.

It is not sufficient that soil possesses all the ingredients necessary for rendering it fertile, or that these ingredients are in a sufficiently comminuted state to enable them to be absorbed; there is besides a certain physical or mechanical condition necessary. Thus, for example, a soil which possesses too great a proportion of silica is too little retentive of moisture, and has not sufficient consistency of texture to be an effective support of tall plants; one in which calcareous matter abounds is also too dry a soil; while if alumina predominates, it is generally too retentive of moisture; and a great excess of the last-named ingredient renders it so extremely tenacious as to be almost incapable of reduction to a proper mechanical state. The soil which is physically most perfect is composed of about equal proportions of the two great ingredients, silica and alumina, and is generally known as *loam*, being distinguished into *clay loam or sandy loam*, according as the alumina or silica sensibly predominates. But the physical qualities of soils do not wholly depend upon their composition; they are also largely affected by the depth of the soil itself, and the quality of the subsoil. Should the soil and subsoil be both retentive, or both porous, the defects of these states as to dryness or moisture are considerably increased; if porous and retentive soils of good depth rest upon subsoils of a contrary character, the defects of the former are to a considerable degree amended. But the advantages and disadvantages of these conditions must to a very large extent be judged by the prevalent character of the climate, a somewhat porous subsoil in a cold moist district being generally preferable, and *vice versa*. Each of these classes of soils, when possessed of the chemical ingredients in quantity sufficient for the wants of plants, and of a texture favorable to their growth, excels in the production of certain species. Thus, the clay loams are unequalled for the production of wheat and

beans; the sandy loams for barley, rye, and the various root-crops; while both are well suited for the growth of the other cultivated plants, or for perennial pasture.

Besides the calcareous and marly soils which may be, according to circumstances, classed as a clayey or sandy soil, rarely the former, there is the humous soil, which possesses characteristics peculiarly its own. It is not devoid of consistency like the sandy, or retentive of moisture like the clayey soils, but in its natural state is spongy and elastic in texture, of a remarkably dark color, and, when dried, becomes inflammable, and even when much improved by culture retains these characteristics in a considerable degree. It consists wholly, or to a great extent, of vegetable matter, and is found in perfection in forests of ancient date, as the woods of America, and in the peculiar form of peat (q.v.) in many parts of the world. In its ordinarily decomposed condition, it is at once the richest of soils; but in the state of peat it calls for long-continued drainage, and the application of decomposing agents, before it can be rendered of service in the production of crops.

Improvement of a soil must, then, as is seen from the foregoing considerations, be effected either by supplying the substances required by plants to a soil which is deficient in them, by altering its depth and texture, and by removing excess, or supplying deficiency of moisture. The first of these objects is effected by the introduction and incorporation of manures (q.v.) with the soil, care being taken that the manure contains the requisite ingredients, and in such a condition as to be assimilable by plants either directly or indirectly through the soil, and by the more thorough exposure of the soil to the action of the atmosphere; the second is effected by the admixture of marl or clay with sandy, chalky, or peat soils, of lime, ashes, or burned clay, with tenacious clay soils, or by the mixture of the subsoil (if differing in quality) with the soil by means of the subsoil plow, or by more complete surface-tillage, and free exposure to the action of frost; and the third is accomplished by drainage (q.v.) and irrigation (q.v.). The fertility and chemical composition of a soil may be approximately determined by inspection of its color and texture; but more accurately, as well as its dryness or moisture, excess or defect of silica and alumina, by the predominance of certain species of wild plants or weeds.

SOISSONS, a t. of France, in the department of Aisne, stands in a fertile vale on the banks of the river Aisne, about 65 m. n.e. of Paris. Soissons is the key of Paris for an army invading France from the Netherlands, and is the meeting-point of six military roads. The principal building is the cathedral of Notre Dame, founded in the 12th c., the library of which contains many rare MSS. There are also some remains of the great castellated abbey of St. Jean des Vignes, where Thomas à Becket found refuge when in exile. Quite near to Soissons is an institute for "deaf and dumb," which occupies the site of the famous abbey of St. Médard, where Clotaire and Sigebert were buried. Soissons has manufactures of linen, woollens, and cottons. Pop. '91, 11,352. Soissons is one of the oldest towns in France, and was celebrated even in the time of the Romans, when it bore the names first of *Noviodunum*, and afterward of *Augusta Suessionum*; hence its modern name of Soissons. It was the last Roman stronghold in Gaul that withstood the arms of Clovis, who here overthrew Syagrius, the Roman commander, in 486, and made it the seat of the Frankish monarchy, which it long continued to be.

SOJOURNER TRUTH, 1775-1883; born Ulster county, N. Y.; died Battle Creek, Mich. She was born a slave and was known by the name of Isabella until she gained her freedom in 1827. She was uneducated, but became an enthusiast in religion, and after her emancipation delivered lectures in different parts of the country on slavery and temperance, and held religious meetings. She was a great admirer of Abraham Lincoln, and visited him at the White House. Mrs. Harriet Beecher Stowe wrote what is known as Sojourner Truth's *Book of Life*, a new edition of which appeared, 1876. Though ignorant she had much native force of character, a shrewd wit, and evident sincerity.

SOKOTO, a kingdom of Africa, in Sudan, to the s.w. of lake Tchad, and separated from it by the state of Bornu (q.v.). Area, 124,900 sq. miles. The number of inhabitants is estimated at 10,000,000. A formidable military force is maintained.—*Sókoto*, the capital, stands on the Zirmie, an affluent of the Sókoto, which flows into the Quorra. Manufactures are in a flourishing condition. Its market is of great importance; it trades in raw silk, glass-wares, and perfumery, carries on extensive and famous manufactures of leather goods, and has about 30,000 inhabitants.

SOLANACEÆ, or **SOLANÆÆ**, a natural order of exogenous plants, mostly herbaceous plants and shrubs, but including a few tropical trees. The leaves are mostly alternate, undivided, or lobed, without stipules. The flowers are regular, or nearly so; the calyx and corolla generally 5-cleft; the stamens generally five. The fruit is either a capsule or a berry, mostly 2-celled. The plants of this order are mostly natives of tropical countries, a small number extending into the temperate and moderately cold climates of both hemispheres; in the coldest regions they are entirely wanting. They are mostly distinguished by an offensive smell, and by containing in greater or less abundance a narcotic, poisonous substance, usually associated with a pungent principle, and some of them are among the most active poisons. Sometimes the narcotic substance predominates as in mandrake (q.v.) and henbane (q.v.); sometimes the pungent substance pre-

dominates, or is alone present, as in Cayenne pepper (*capsicum*); sometimes both are present in more or less equal proportion, as in tobacco, thorn-apple, or stramonium, and belladonna. The fruit is generally poisonous; but that of a considerable number of species, in which acids and mucilage predominate, is eatable, as, for instance, the berries of the winter cherry and other species of *physalis*, those of the egg-plant (q.v.) and some other species of *solanum*, and of the love-apple (*lycopersicum*). The tubers, which occur in a few species, contain much starch, and serve as an article of food, of which the potato is the chief example. The seeds of all contain a fixed oil, which in the s. of Germany is expressed from the seeds of the belladonna itself.

SOLANDER, DANIEL CHARLES, LL.D., 1736-82; b. Sweden; studied with Linnæus; graduated in medicine at the university of Upsala; visited England in 1760; accompanied sir Joseph Banks on the voyage round the world with Capt. Cook; appointed under-librarian of the British museum, 1773, to which he left a collection of valuable manuscripts. He wrote a *Description of the Collection of Petrifications found in Hampshire*, and *Observations on Natural History in Cook's Voyage*.

SOLAN GOOSE. See GANNET.

SOLA'NO. See SIMOOM.

SOLA'NO, a co. in central California, bounded on the s. by the strait of Carquinez and Suisun bay; crossed by the California Pacific railroad; about 960 sq.m.; pop. '90, 20,946, chiefly of American birth. The surface is varied. The soil is fertile. The principal productions are cattle, wheat, barley, wool, and wine. Co. seat, Fairfield.

SOLA NUM, a genus of plants of the natural order *solanaceæ*, containing a great number of species, which are distributed all over the world but are particularly abundant in South America and the West Indies. Some of the species are herbaceous, others are shrubs; some of them unarmed and some of them spiny; many covered with a down of star-like hairs. The flowers are in false umbels, or almost in panicles; seldom in racemes, or solitary. The anthers open by two holes at the top. The berries are two-celled, and contain many smooth seeds. The species of this genus almost always contain in all their parts a poisonous alkaloid, *solanine*, in greater or less quantity, sometimes so much that the leaves or the berries cannot be eaten without danger, while in a few species the quantity present is so small as to be insignificant, and these parts are eaten freely, being agreeable and harmless. By far the most important of all the species is *S. tuberosum*, the potato (q.v.), in which, however, *solanine* is found in considerable quantity, so that not only the herbage, but the juice of the raw tubers is unwholesome. Of the species with eatable fruit, the principal is *S. melongena*, the egg-plant (q.v.).—The only British species are *S. dulcamara*, the bittersweet (q.v.), and *S. nigrum*, the common nightshade (q.v.), both of which possess poisonous and medicinal qualities. The berries, leaves, bark, and roots of various species are employed for different medicinal uses in the warm countries of which they are natives; but their properties have not yet been sufficiently investigated. The berries of *S. saponaceum* are used as a substitute for soap.

SOLAR, an upper chamber or loft. The only private apartment in the old baronial halls was so called. It was placed over the pantry, at one end of the hall, and served as parlor and sleeping apartment for the baron and his family.

SOLAR CYCLE. See PERIOD.

SOLAR MICROSCOPE, an instrument for producing magnified images of minute objects on a screen, through the agency of the sun's rays. The tube of the microscope is conical, and is fastened to the interior side of a closed window-shutter over a hole in the latter; a reflector, placed at the hole so that the rays of light may fall on it, is so adjusted as to throw them along the tube. They are then collected by a powerful double convex lens, and thrown on the object, which is inserted into the tube at the focus of the lens by a slit at the side. After passing the object, the rays again pass through a single lens, or a combination of lenses, make their exit from the tube, and fall on a screen, on which they depict a magnified image of the object. We have here supposed the object to be so translucent as to allow of the passage of rays through it. Should it be opaque, the rays of light reflected from the mirror are caught by the double convex lens, which concentrates them on another mirror near the opposite end of the tube; they are thence reflected upon the back of the object, and diverge on the system of lenses at the mouth, which form the image. Instead of the sun's rays, the oxyhydrogen lime-light (and more recently the electric light) has been employed, its rays being thrown on the double-convex condenser by means of a concave reflector, in whose focus the piece of burning lime or marble is situated. The instrument is hence often called the *oxyhydrogen microscope*.

SOLAR SYSTEM. The planets and comets which circle round the sun combine with it to form a system to which is given the name of *solar* or *planetary* system. It is probable that each star is the center of an analogous system. This, however, is merely a matter of speculation, and in no way practically concerns us; but it is different with the solar system. No change of much magnitude can take place in the elements of the planets without having effect on the earth and its inhabitants, on account of the mutual attractions of the planets for each other; in fact, they appear as members of one isolated family, bound together by common ties, which could not be ruptured in the case of one

individual without communicating a general shock to the others. The various members of the solar system are noticed under PLANETS, PLANETOIDS, COMET, SUN, MOON, SATELLITES, METEORS; and their motions are treated of under GRAVITATION, CENTRAL FORCES, PRECESSION, etc., so that it only remains here to give the more interesting numerical facts connected with them, which can be done most conveniently in a tabular form.

Name.	Diameter in Miles.	Density, Earth's being = 1.	Mass, Sun's being = 1.	Distance from Sun in Millions of Miles.	Period of Revolution in Days.	Velocity in Orbit— Miles per Hour.	Velocity of Rotation at Equator— Miles per Hour.

SOLATIUM, in Scotch law, means compensation for wounded feelings, and is something over and above the ordinary pecuniary value of the damage. In America such a ground of damages is not in strict principle admitted, but in practice there is no substantial difference.

SOLDER, an easily fusible alloy used for joining metals. Solders are of various kinds, suited to different metals. They always require to be used with a flux, such as borax, resin, chloride of zinc, sal-ammoniac, etc. The following are the principal solders: *Pewterers' solder*—bismuth, 2 parts; lead, 4 parts; tin, 3 parts. This can be used for coarse work by the direct application of naked fire; but for fine work, requiring the protection of a muffle-furnace, the composition must be bismuth and lead, of each 1 part; tin, 2 parts. *Plumbers' solder* for coarse work—tin, 1 part; lead, 3 parts. For finer work—tin, 2 parts; lead, 1 part. *Spelter solder*—12 parts zinc to 16 parts of copper. *Soft spelter solder*—equal parts of copper and zinc. When solders are applied in the common work of plumbers and tinmen, a tool called the soldering-iron is used: this is made red-hot, and affords a convenient means of applying fire direct to the solder and flux. Although called the soldering-iron, the portion of the tool to be heated must be of copper. In many manufactures, a flame produced by a mixture of atmospheric air and coal-gas is used to melt the solder; and for fine work, such as jewelry, the common blow-pipe is often used.

SOLDIER is one who enters into an obligation to some chieftain or government to devote for a specified period his whole energies, and even if necessary his life itself, to the furtherance of the policy of that chief or government. The consideration may be immediate pay, or prospective reward; or the contract may be merely an act of loyal devotion. The acknowledgment of the service by the employer constitutes the man a recognized soldier, and empowers him to take life in open warfare, without being liable to the penalties of an assassin and a robber. The fact of being mercenary, that is, of receiving wages for killing and being killed, does not render a soldier's trade less honorable. He bears arms that others may be able to do without them; he is precluded by the exigencies of military training from maintaining himself by peaceful occupation; and it is therefore but fair that those whom he protects should support him, and give him, over and above actual maintenance, reasonable wages for the continual risk of his life. If a man willingly enlist himself as a soldier in what he believes to be an unrighteous cause, it is an act of moral turpitude; but when once enlisted, the soldier ceases to be morally responsible for the justice or iniquity of the war he wages; that rests with his employer. Obedience, implicit and entire, is his sole virtue. The maxim is, "The military force never deliberates, but always obeys." See ENLISTMENT, MARTIAL LAW WAR, etc.

SOLDIERS' HOMES. The first institution of this character established by the U. S. government was founded by act of congress passed Mar. 3, 1851—"to found a military asylum for the relief and support of invalid and disabled soldiers of the army of the United States." The funds to conduct this institution originated in tribute levied by Gen. Scott on the City of Mexico, after its capture, for the benefit of the U. S. army. The act referred to above defined the beneficiaries thereof to be soldiers who had served 20 years; pensioners, after surrendering their pensions; and persons disabled by wounds or sickness incurred in the military service of their country. Besides the sum of money already named, the act appropriated an unexpended balance of a previous appropriation to the same purpose, and placed the institution in charge of a board of commissioners, to include the gen. of the army and those general officers commanding the eastern

and western military divisions; and the chiefs of the medical, pay, commissary, and quartermaster's departments, and the adjt.gen. of the army. This portion of the act was revised by the act of Mar. 3, 1859, reducing the number of commissioners to include only the adjt.gen., surgeon-gen., and commissary-gen. of subsistence. Various temporary asylums were erected or leased between 1851 and 1857. In 1851 a purchase of land was made for this purpose in the city of Washington, distant about $3\frac{1}{2}$ m. from the Capitol; including, with later purchases, about 460 acres. This is, in fact, the only permanently established soldiers' home under the act of 1851. It comprehends a farm, orchards, gardens, park, etc.; the building is white marble, calculated to accommodate about 500 inmates at one time; and a chapel, well-stocked library, and hospital complete the excellent service of the institution. The number of inmates of this establishment up to the year 1885 was in the neighborhood of 3,000. Besides this one there were founded under the acts of 1865 and 1873 homes for volunteer soldiers of the war of 1861-65 in Chelsea, near Augusta, Me.; Hampton, Va.; Dayton, Ohio; and Milwaukee, Wis. Appropriations are made annually by congress for the support of these institutions. Similar institutions are the Chelsea hospital, Eng.; Kilmainham hospital, near Dublin; a like establishment in Berlin; and the Hôtel des Invalides, Paris.

SOLDO. See **SOLIDUS**.

SOLE, *Solea*, a genus of flat-fishes (*pleuronectidæ*), of an oblong form, with a rounded muzzle, which almost always advances beyond the mouth; the mouth twisted to the side opposite to that on which the eyes are situated, which is usually the right side, although individuals of the same species are found having the eyes and color on the left side; the teeth very small in both jaws, but only in the under part of the mouth (the side opposite to the eyes); the lateral line straight; pectoral fins on both sides; the dorsal and anal fins long, and extending to the tail, but distinct from the tail-fin.

SOL ECISM. A solecism is the term applied to any violation of the grammar or idiom of a language, or of the usages of society. It is said to be derived from the city of Soli in Cilicia, whose inhabitants spoke very bad Greek, in consequence of their intercourse with the Cilician natives, and provoked the fastidious Athenians to coin the epithet.

SOLEMN LEAGUE AND COVENANT. See **COVENANTS, THE**.

SOL EN, a genus of lamellibranchiate mollusks, the type of the family *solenidæ*, remarkable for the wide gaping of the shell at both ends, and the large and muscular foot. In the genus solen the shell is remarkably elongated, its apparent length being, however, more strictly its breadth. From its form the names **RAZOR-SHELL** and **RAZOR-FISH** are often given to it. The species are numerous, and inhabit the sands of all seas except in the coldest parts of the world.

SOLENHOFEN LITHOGRAPHIC STONE, a famous deposit of limestone of upper oolite age, which from its fine-grained and homogeneous texture is admirably adapted for lithographic purposes. It occurs near Aichstadt in Bavaria, and has been extensively quarried since the invention of lithography. The quarrymen work upon the lines of stratification, which are beautifully parallel, and all the fossils are found upon the natural surfaces of the beds, and present an impression and cast in almost every instance. The rock is quarried to a depth of 80 or 90 feet. It is of special interest to the geologist from the singular assemblage of fossil remains which are preserved in it with wonderful minuteness. See **ARCHÆOPTERYX**.

SOLENOID, a coil of wire used for producing magnetic effects by electric currents. See **ELECTRICITY**; **MAGNETOS**.

SOL ENT, the name of the western portion of the strait that intervenes between the Isle of Wight and the main-land of England. At Hurst castle, which guards its entrance on the s. w., the Solent is less than a mile in breadth; and along this narrow passage the tide flows with a rapidity which at certain times no boat can stem. The castle itself consists of a central tower or keep, surrounded by several smaller towers, and mounted with heavy guns.

SOLEURE (Ger. *Solothurn*), a canton in the n. of Switzerland, bounded on the w. and s. by Bern, and on the n. and e. by Basel and Aargau. Area 302 sq. m.; pop. '94, 89,290, mostly Roman Catholics. The greater portion of the canton is fertile and well cultivated, especially along the banks of the Aar. Even the rugged and hilly districts are sources of wealth on account of their fine pasturage. Besides grain, the principal products of Soleure are fruit, wine, flax, and cotton.

SOLEURE, (Ger. *Solothurn*), capital of the canton, is situated on the Aar, 16, m. n.e. of Bern by railway. The scenery in its vicinity is among the loveliest in Switzerland. The Aar flows through the town, dividing it into two unequal parts, which are connected by two wooden bridges. The most notable building is the cathedral of St. Ursinus, with a cupola and façade of Corinthian columns, reckoned the most costly cathedral in Switzerland. Soleure has some manufactures, but derives its chief industrial importance from its transit-trade. Pop. '90, 8460. Near to Soleure are the baths of Weissenstein.

SOLFATA RA (Fr. *Soufrière*, Ger. *Schwefelgrube* or *Schwefelsee*), the Italian name for such volcanoes as, having become less active than volcanoes in an actual state of eruption, only exhale gases. The most notable of them are found in Italy, in the Antilles,

in the interior of Asia, and in Java. The Solfatara of Pozzuoli, near Naples, is an irregular plain, 1368 ft. long, and 1310 ft. broad, almost surrounded by broken hills of pumiceous tufa, the ancient walls of the crater. From the crevices of the rocks, steam or noxious gases, chiefly sulphureted hydrogen, mixed with a minute quantity of muriatic acid and muriate of ammonia, exhale. In the cracks and fissures of the rocks, sulphur, alum, and sulphate of iron abound. The vapors exhaled are used as medicinal baths, and huts, constructed of boards, have been erected in which the baths may be obtained. The Soufrière of Morne-Garou, in the isle of St. Vincent, Lesser Antilles, about three miles in circuit, and over 500 ft. in depth, has in its center a cone, the summit of which is covered with sulphur.

SOLFEGGIO, in music, seven syllables, which are sometimes used as a nomenclature for the seven notes of the scale. In singing, the art of applying these syllables to the notes as an exercise for the learner is called *solmization*. The syllables are *ut* (or *do*), *re*, *mi*, *fa*, *sol*, *la*, and *si*. The first six are the commencement of the lines of an ancient monkish hymn to John the Baptist, which had this peculiarity, that the first syllable of each line was sung to a note one degree higher than the first syllable of the line that preceded, so as to present the type of a scale:

These syllables are said to have been first made use of by Guido of Arezzo, in the 11th c.; and Le Maire, a French musician of the 17th c., added to them *si*, for the seventh of the scale. When applied to the key of C, their equivalents, in the ordinary musical nomenclature, are:

Do	re	mi	fa	sol	la	si	do
C	D	E	F	G	A	B	C

These syllables may, however, according to the more modern practice of teachers in this country, be applied to other keys, with *do* always as the key-note, so as to express, not the absolute pitch of a note, but its relation to the key-note; and thus used, they are thought to be of service to the learner in keeping prominently before him the principle that there is but one scale in music, which is raised or lowered according to the pitch of the key. Different variations in the way of using the syllables have recently given rise to various supposed short and easy modes of teaching singing, the best known of which is Mr. Curwen's system of "tonic solmization," where the ordinary notation of the staff, with its lines and spaces, is entirely rejected, and a notation substituted which is formed of the solfeggio syllables, used to express not pitch but relation to the key-note. One disadvantage of this and similar schemes is the entire withdrawal of the direct indication of the pitch of the sounds to the eye, by the notes ascending as the sounds ascend, which is so beautiful a feature of the common notation. And even if it be granted that the first rudiments of music can, as has been asserted, be taken up with remarkable ease by the pupil who learns on the tonic sol-fa system, it is undeniable that as soon as he comes in contact with notes of different lengths, or begins to modulate from one key to another, he is beset with serious difficulties.

SOLFERINO, a village of northern Italy, province of Brescia, 20 m. n.w. of Mantua, with, '81, 1284 inhabitants. It stands on a hill, and has a tower called the Spy of Italy (*Spia d'Italia*), from which the whole plain of Lombardy may be seen. There, in 1796, the French conquered the Austrians. On June 24, 1859, Solferino was again the scene of an overwhelming victory obtained by the French and Italians over the Austrians.

SOLICITING, the offense committed by the prostitute in the streets, in calling attention to herself, and punishable in all cities both in Europe and America, though in London the police do not notice the offense unless complaint is made. See **PROSTITUTION**.

SOLICITOR. See **ATTORNEYS**.

SOLICITOR-GENERAL, the name given to one of the law-officers of the crown. The solicitor-general of England has powers similar to those of the attorney general (q.v.), to whom he gives aid in discharging his functions. During the absence of the attorney-general, he may do every act and execute every authority of that officer. He is, *ex officio*, one of the commissioners of patents.

SOLICITOR TO THE TREASURY, an English official who acts for the government in all legal proceedings. He has also to act as solicitor for the three secretaries of state, the privy council office, the board of trade, the mint, the war office, the stationery

office, and for all the other principal departments for which no solicitor is specially appointed.

SOLIDUNGULA. See *EQUIDÆ*.

SOLIDUS, the name by which the old Roman "aureus" (equivalent to five dollars according to the present value of gold) was known after the time of Alexander Severus; but during the reign of Constantine the great its value was diminished in the ratio of 8:5, and so remained till the end of the empire. The weight of these later solidi was fixed at $\frac{1}{8}$ of an ounce, the gold being 23 carats fine, and the alloy mostly native silver. The "solidus," or "solidus aureus," was adopted by the Franks under the Merovingians and Carolingians (at 87 to the Roman pound) till the time of Pepin, who suppressed it; but another solidus of silver, or "solidus argenteus"—the $\frac{1}{20}$ of the libra or pound—which had been used only as a money of account, was soon after made a coin. In after-times, this "sol," or "sou," like all other coins, underwent an infinity of variations in fineness and value (see *LIVRE*). On the introduction of the decimal system (1793) into France, the sou was abolished, and a piece of 5 centimes ($\frac{1}{20}$ of a franc) substituted, but the name continued in common use, and the old sous were retained in circulation. The solidus also appears in the *soldo*, which was a coin in use in northern and central Italy, and was essentially the same with the sou.

SOLINGEN, a t. of Prussia, province of the Rhine, and government of Düsseldorf, capital of a circle of the same name, is situated on a height, 18 m. n.n.e. of Cologne, and not far from the river Wupper. It is a very old place, and has long been famous for its steel and iron ware manufactures, especially sword-blades, helmets, cuirasses, knives, and scissors, which are exported to all parts of the world, and rival the excellence of English wares. Solingen hand-bells have been famous since the middle ages, and are sent to the most distant lands. Pop. '95, 40,843.

SOLIS Y RIBADENEYRA, ANTONIO DE, 1610-86; b. Spain; entered holy orders in 1667. He wrote several plays, of which *La Gitanilla*, "The Little Gipsy Girl," is the best known. His historical writings are of more importance, especially his *Historia de la Conquista de México* (1684), which was translated into English by Townsend, 1724. He was long royal historiographer.

SOLIS, JUAN DIAZ DE, about 1470-1516, b. Spain. He accompanied Pinzon in his explorations, and in his company discovered Yucatan in 1506. Shortly afterward they explored the South American coast from cape St. Augustine to lat. 40° south. After their return to Spain, 1509, a quarrel between them resulted in the imprisonment of Solis, while Pinzon was in court favor. He was released, indemnified, and in 1515 made further explorations from cape San Roque to Rio de Janeiro, and discovered the La Plata. He was killed by the Indians.

SOLITAIRE, *Pezophaps*, a genus of birds of the Dodo (q.v.) family (*Didinæ*), but differing from the dodos in a smaller bill and longer legs. Like the dodos, the only species of this genus, of the existence of which there is any evidence (*P. solitaria*), seems to be now extinct, and to have become extinct in very recent times. It inhabited the island of Rodriguez, an island about 15 m. long by 6 broad, situated about 300 m. to the e. of Mauritius, and appears to have been peculiar to that small and lonely island, where it was abundant at the beginning of the 18th century. Rodriguez was uninhabited till 1691, when a colony of French Protestant refugees settled on it, under the command of François Leguat, who, in his *Voyages et Aventures*, has left an interesting and trustworthy account of the solitaire. He describes it as a large bird, the males sometimes weighing 45 lbs.; taller than a turkey, the neck a little longer in proportion, and carried erect; the head of the male without comb or crest, that of the female with something like a widow's peak above the bill; the wings small, and the bird incapable of flying, but only using the wings to flap itself or to flutter when calling for its mate, or as a weapon of offense or defense; the bone of the wing being thickened at the extremity so as to form a round mass, about the size of a musket-bullet, under the feathers, and to increase the force of the blow given by it; a roundish mass of feathers instead of a tail. He further describes the plumage as very full and beautiful, not a feather out of its place, so there can have been no feathers with unconnected webs, as in the ostrich. He says the bird is called solitaire because it is very seldom seen in flocks. He tells us that the bird is with difficulty caught in the forests, but easily on open ground, because it can be outrun by a man; and that its flesh is very good to eat.—But the solitaire seems to have completely disappeared from Rodriguez, which is now a British settlement. Bones have been lately found in large quantities, and since Prof. Newton's visit to Rodriguez in 1865, the skeleton has been entirely reconstructed, and skeletons are preserved in the South Kensington museum, in the Royal college of surgeons, and in the Museum of the university of Cambridge.

The name solitaire was originally given to a species of dodo inhabiting Bourbon, also extinct, of which the remains have never been found, and was applied by Leguat to this bird, in a mistaken belief of its being the same. See *Strickland and Melville on the Dodo and its Kindred*.

SOLITAIRE, a species of game or rather puzzle, which, as the name denotes, is played by only one person. The apparatus for the game consists of a round or octagonal flat board, indented with 33 or 37 hemispherical hollows, and 33 or 37 balls, one in each hollow. The process of the game consists in removing one ball from the board, and then, having created a vacancy, capturing one of the balls adjoining by causing the one behind to leap over it into the vacant hollow; there are now two vacancies, and the game is continued in the same manner by capturing ball after ball, till only one remains, when the game is *won*. Should more than one be left, and they be so isolated as not to be liable to capture by each other, the game is *lost*. This puzzle may be solved in an immense number of ways; one of the prettiest modes consists in removing the central ball, and so capturing the others that the last ball shall be in the center.

SOLLER, a small town and seaport of the Balearic isles, in Majorca, 13 m. n.e. of Palma. It exports oranges and wine, and contained '87, 7988 inhabitants.

SOLMIZATION. See SOLFEGGIO.

SOLO, a term used in musical compositions of several parts, whether vocal or instrumental, to indicate those voices or instruments that are to perform alone or in a more prominent manner, as *soprano solo*, *violino solo*. The plural *solis*, is used when two or more voices or instrumental parts are to be performed together, such parts, of course, never being double.—A composition for a single instrument accompanied is also termed a solo.

SOLO'FRA, a small city of southern Italy, province of Avellino. Pop. '81, 3864. It is situated on the Apennines, and is surrounded by wooded mountains.

SOLOMON (Hebr. Shēlōmō, Salomon, Suleimān, derived from *shalon*, peace = peaceful, like Germ. Friedrich), the second son of David and Bathsheba; successor of the former on the throne of the Israelitish empire for 40 years (1015-975 B.C.*). Nothing is known of his youth except that he was probably educated by Nathan (or Jehiel). Equally uncertain is the age at which he succeeded to the crown of his father. That he was older than 12 or 14 years, as some traditions tell us, seems certain. The way in which his succession to the throne during the lifetime of his father was brought about, to the exclusion of his elder brother Adonijah, is not undeserving of the name of *coup d'état*, which has been bestowed upon it (see the Scripture narrative). Having, by the execution of Adonijah and the leaders of his faction, secured his dominion against internal foes, he, with complete disregard of the Mosaic law, set himself to seek foreign alliances, and with this view married as his principal wife the daughter of Pharaoh, probably of Psusenes (Vaphres?), of the twenty-first dynasty. Besides her, however, he had a vast number of wives—700 “princesses,” and 300 “concubines”—the greatest part of whom were recruited from nations with whom an alliance had been strictly prohibited. Having inherited fabulous wealth, and further adding to it enormously from his own multifarious revenues, so that “silver was nothing accounted of in his days,” it became necessary that a new organization corresponding to this unheard-of splendor should be introduced. Accordingly, we hear of “princes,” i. e., great officers of state, not before heard of. The two counselors of David's time disappear, in order probably to make room for a whole body of legal advisers; the prophets are no longer to be found among the dignitaries of state, but new military charges are created instead. The immense accumulation of treasure also allowed the execution of a number of public works in Jerusalem, which now first assumed the magnificence and station of a capital. A new wall with fortified towers was erected around it; and the queen's palace—“the house of the forest of Lebanon”—with a long hall joined to it by a cedar porch, called the “tower of David,” outside of which a thousand golden shields were suspended, and within which the king sat, in all his imperial splendor, to pass judgment, were built under his immediate orders. His banquets, at which all the vessels were of gold; his tables, with their four (or forty) thousand stalls; his gardens and parks and summer retreats, were such as to dazzle even eastern fancy. Twelve commissaries, distributed in the different provinces, had each in his turn to furnish the means of sustaining this prodigious household. The dominion of Solomon extended from Thapsacus, on the Euphrates, to Gaza on the Mediterranean. The country was in the profoundest state of peace; the treasures accumulated by David appeared inexhaustible; and the popularity of the king, who listened to the meanest of his subjects; and gave judgment according to that wisdom, for which he had asked in his vision at Gibeon, in preference to any other gift, and which has remained proverbial from his day to ours, was naturally at first very great. Everything, moreover, was done to develop and increase the national wealth and welfare. The rich internal resources were developed, and commercial relations of the most extensive nature established.

Through the port established at Ezion-Geber, at the head of the gulf of Elath, an outlet was gained to the Indian ocean; and the alliance with Phenicia, then under the sway of Hiram, gave an energetic impulse to these foreign expeditions. Manned with Tyrian sailors, the Israelite fleets went to “Ophir,” and brought back, in exchange for their own exportations, “gold and silver, apes and peacocks, ivory and spices;” and the

* There is some discrepancy among investigators about this date; the beginning of his reign being fixed variously at 1009, 1025, 990, etc.

rest of the strange and precious produce of India, Africa, Spain, and other regions, possibly even our own coasts.

According to his promise, Solomon, in the fourth year of his accession, commenced the building of the temple on Moriah, after the model of the tabernacle, wherein he was aided by Hiram, who not only sent him timber, but architects and cunning Phenician artists in wood and stone and metals. In the eleventh year of his reign it was completed, and solemnly inaugurated in the following year—at which occasion prodigious numbers of sacrifices were slaughtered. Thirteen years more having been spent in the construction of the “house of the forest of Lebanon” (the royal palace), other buildings and fortifications—among them that of Palmyra—are recorded to have been undertaken by the king, who, far from wishing further to extend his dominions, was only bent upon keeping his frontiers safe from the raids of the neighboring hordes, and for that purpose alone kept up an unprecedentedly large army.

The fame of Solomon could not but spread far and near. The splendor of his court and reign, heightened by his personal qualities, his wisdom and erudition—for he was not only the wisest but also the most learned of men—brought embassies from all parts to Jerusalem to witness his magnificence, and to lay gifts of tribute at his feet. The queen of Sheba's expedition and presents are well known; and as many Arab kings made him annual presents of a no less splendid nature, his income from different sources was calculated, in round numbers, at the enormous sum of 666 golden talents. That people of Moses, which was to know no other wealth than flocks and the fruits of the soil, had suddenly become a people of wealthy merchants, of soldiers, and of courtiers—and it did not profit by the change, chiefly through the bad influence of the king himself and his court. The army and the public buildings absorbed the resources of the provinces. In the Temple, erected for the purpose of the true worship of Jehovah, Solomon sacrificed three times a year; but nevertheless, to please his concubines, he allowed, and perhaps himself indulged in, the rites of polytheism on the heights, thereby setting the worst example to his subjects, sufficiently eager already to worship foreign deities. His exaggerated polygamy fostered immorality and licentiousness among the people; and, worst of all, the wise and gentle monarch, as his treasure got exhausted, began, toward the end of his reign, to lay the yoke, which hitherto had lain only on his Canaanite subjects, upon the Israelites themselves. And he thus became, to all intents and purposes, an eastern despot—selling part of his dominion to raise money, and trying to break the spirit of the nation by forced services and corporal chastisements.

Left by the “prophets,” probably since his open and revolting infidelity with regard to the national worship, his advisers were chiefly insolent young courtiers, who awed even his aged counselors into silence, and from that time forth a storm began to gather over the land. The priests were on the side of the malcontents, and a vague talk of a general rising, which actually found utterance by a “prophet” in the face of Solomon, was heard throughout the country. Ahijah of Shiloh predicted, as Samuel had done to David, the partial dominion to the Ephraimite Jeroboam, who had to flee for his life to Egypt. But notwithstanding these internal mutterings, and the open revolts of one or two subject chiefs, such was the prestige both of David's and Solomon's name, that the king was allowed to die in peace.

Solomon has been supposed to be the author of Canticles (q.v.), Ecclesiastes (q.v.), Proverbs (q.v.), besides works on science which are said to be lost. But he is also to be considered the prime cause of the final and decisive downfall of the Jewish commonwealth for all historical times. His wisdom turned into folly, his justice into tyranny, raised a smoldering discontent which only awaited his death to break out into open flames of revolt and internal wars. His character presents the lamentable spectacle of genius gone astray; and many have been the discussions on the part of learned theologians in old and late times as to whether or not there was any hope of his “salvation.” His name and his glory, however, will, notwithstanding the shadows that fall over his latter days, remain immortal, whether we look at the striking picture of him given in Scripture, or to the more gorgeous kaleidoscope of eastern legends revolving round the golden name of Suleiman: the lord and master of all animate and inanimate beings under the sun, the most beautiful, the most wealthy of all created men, and whose wisdom was as much without limits as were his riches and power.—See for such legendary accounts of Solomon, Weil's *Biblical Legends*, the *Targums*, the *Koran*, Lane's *Arabian Nights*, D'Herbelot, Ginsburg, Furst's *Pertenschnure Suleiman-Nameh* in 70 books, ascribed to a Turkish poet, Firdusi, etc.

SOLOMON BEN GABIROL. See AVICEBRON.

SOLOMON BEN ISAAC. See RASHI.

SOLOMON ISLANDS, a chain of islands in the Malay or Indian Archipelago, between New Britain on the n.w. and the Queen Charlotte islands on the s.e.; lat. 4° 50'—11° 50' south. Area estimated at 9000 sq. m.; pop. thought to be considerable, but not ascertained. The natives are partly Negrillos, partly Malays, and are still in the condition of savages. Earthquakes are frequent. The climate is unhealthy. There is a trade in copra and vegetable ivory in exchange for tobacco, fancy stuffs, beads, knives, etc. Part of the group belongs to England and part to Germany.

SOLOMON'S SEAL, *Polygonatum*, a genus of plants of the natural order *Utiaceæ*, differing from lily of the valley (q.v.) chiefly in the cylindrical tubular perianth, and in having the flowers jointed to their flower-stalks. There are three American species. The **COMMON SOLOMON'S SEAL** (*P. multiflorum*) is found in the woods and copses in many parts of England, and a few places in Scotland. It has a stem about two feet high, the upper part of which bears a number of large, ovate-elliptical, alternate leaves in two rows. The flower-stalks are generally branched; the flowers not large, white, and drooping.—The **NARROW-LEAVED SOLOMON'S SEAL** (*P. verticillatum*) is a rare British plant, only found in a few places in Scotland. The leaves are whorled.—The **ANGULAR, or SWEET-SMELLING SOLOMON'S SEAL** (*P. officinale*) is also rare in Britain, and is found only in England. It more nearly resembles the Common Solomon's Seal, but is smaller, and has greenish, fragrant flowers. These two species are common in many parts of Europe. They are very similar in their properties. The young shoots of *P. officinale* are eaten by the Turks like asparagus. The root is white, fleshy, inodorous, with a sweetish, mucilaginous, acrid taste. It contains *Asparagin*. It is a popular application to bruises, to prevent or remove discoloration, and its use is well known to those who are too apt to get a black eye now and then. A kind of bread has been made of it in times of scarcity. The berries are emetic and purgative.

SOLOMON'S SONG. See CANTICLES.

SOLON, the most famous of all the ancient Greek lawgivers, was a native of Athens (b. about 638 B.C.), and belonged to one of the most distinguished families of Attica. His father, Exceestides, having seriously impaired his income by improvidence, Solon was obliged, while still young, to embark in trade. At first, however, Solon comes before us as an amatory poet. His earliest appearance in the field of politics was occasioned by the contest between Athens and Megara for the possession of Salamis. By force of artifice, Solon revived the martial spirit of his countrymen, which had sunk under the effect of repeated disasters, obtained command of a body of volunteers, and conquered the island (*circa* 596 B.C.), in which, along with others, he obtained a grant of land. Henceforth his public career is conspicuously noble and honorable. He figures as a wise and unselfish patriot, seeking earnestly, and not in vain, to compose the distractions, partly social and partly political, that rent his native city. The Athenians generally had thorough confidence in his integrity; and in 594 B.C. he was chosen archon or chief magistrate, and received unlimited permission to act as he saw best for the good of the state. In short, to borrow a phrase from Roman history, he was invested with dictatorial power. The nature and extent of the Solonian legislation has been the subject of much criticism in modern times, and Mr. Grote, in particular, has made it very clear that the "later ancients" (Plutarch and Diogenes Laërtius), on whom we are obliged to rely for almost all our information about Solon, are full of confusions, misapprehensions, and contradictions, and that it became a habit among them to mythically attribute to the great Athenian every bit of wise legislation whose paternity they could not discover.

In order to alleviate the wretchedness arising from the existing relations of debtor and creditor, which was no longer supportable, and was likely to create a social war, Solon proposed and carried a notable measure—the *seisachtheia*, or "disburdening ordinance" (from *seio*, to "shake off," and *achthos*, a "burden")—which received its name from its design—viz., to lighten the burden of debt that weighed down the *thetes*, or lower classes. How this was effected, is far from being correctly explained by Plutarch, and the reader who wishes to have the most rational solution of the matter must consult Grote's *History of Greece* (vol. iii.). From redressing the grievances of a class, Solon proceeded, at the solicitations of his countrymen, to remodel the constitution; and here, too, the qualities that are popularly associated with his name shine out conspicuously. Abandoning the semi-civilized theory which regards the nobles as alone worthy of citizenship, and of the honors of public office in the state, he introduced the timocratic, or rather the plutocratic principle—classifying citizens according to their wealth or property; the effect of which was not to wrest *all* power or dignity from the hands of the *eupatridæ*, or well-born class, but only to give a portion of it to others who might be as wealthy, and therefore, presumably, as intelligent and cultivated as they. Such a reform has been compared to that previously effected by Servius Tullius in the constitution of ancient Rome; and there is at least a striking resemblance in the method, if not in the design, of the two reforms. See **ROME**. Solon distributed the citizens into four classes. The first embraced all those whose yearly income reached 500 medimni; the second, those of between 300 and 500 medimni; the third, those of between 200 and 300 medimni, and the fourth, those whose income fell below 200 medimni. The first three classes were liable to *direct* taxation; the fourth not; but all were liable to *indirect* taxation. With regard to the *boule*, or deliberative assembly of four hundred, it would seem that Solon left it the strictly aristocratical body that he found it. Its power, however, was practically limited by a new *ecclesia*, or assembly of the four classes, whose ratification was necessary to all measures originating in the *boule*, or "upper house." On the other hand, the *ecclesia* itself could originate nothing, and thus the attic aristocracy and the attic plebs could mutually check each other's assumptions. The part of Solon's legislation relating to the industrial pursuits of the citizens appears to have been as

excellent and well considered as the rest, but the number of his special enactments is so great that we cannot afford space to mention them. It is enough to state that they embraced almost every subject of social importance; and the best testimony to their value lies in the fact, that when Peisistratos violently overthrew the political constitution established by his kinsman, he allowed his social legislation to stand. See *PEISTRATOS*.

The story of Solon's leaving Athens for ten years, after he had completed his labors as a lawgiver, and traveling into foreign countries, may be, and probably is historical, but the details are untrustworthy; and in particular, the celebrated incident of his interview with Cræsus will not suit the requirements of chronology, and must be relegated to the domain of historic myths. During his absence, the old dissensions among the Athenians broke out, and when he returned, Solon struggled in vain to repress them. A strong hand, as well as a wise head, was needed, and the conspiracy of Peisistratos was quite as much one against anarchy as against the constitution. After Solon's defeat, he withdrew into private life, but occasionally assisted with his advice his bold, ambitious, and able kinsman, who had so effectively crushed the Athenian "disorderlies" of all parties. The date of his death is uncertain.

SOLOR' ISLANDS, THE, lie e. of Flores, between $122^{\circ} 56' 30''$ — $124^{\circ} 25'$ e. long., and belong to the Netherlands residency of Timor. Besides several groups of smaller islands, they consist of Solor, with an area of 105 sq. m., and a pop. of 15,000; Adanara, Lomblem, and Pantar. Solor and Adanara are separated from Flores by narrow straits; Lomblem and Pantar lie in succession further east. Area of the group, 1250 sq. m.; pop. estimated at from 40,000 to 180,000.

Solor has little cultivated land, the natives being good sailors, and chiefly employed in fishing. Much sulphur and saltpeter are found, from which gun-powder is made. The women weave coarse fabrics for clothing, and exotic cotton has lately been planted with success. Edible nests are extensively collected. In all the villages on the coast, markets are stately held, and numerous frequented. The natives near the sea are Malays, friendly to the Dutch, a few of them Christians, the others Mohammedans. Those of the interior are Alfours, wild and warlike, who use shield and bow, sword and fire-arms. Adanara is governed by an independent rajah. It is a lovely island, having hills and dales, picturesque villages, and cultivated fields. The people are Malays, partly Mohammedans and partly Roman Catholics. Lomblem is also beautiful, the natives Malays; those of Pantar being Papuans.

The Solor islands are mountainous; the volcano Lobetolle, in Lomblem, is 4,914 ft. high; and the mountains of Pantar, 3,332. They are clothed to their summits with forests. In 1851 the Portuguese relinquished all claim to these islands, which are now governed by the military commander at Larantooka, in the e. of Flores; a Dutch post-holder being stationed at Lawajang, the chief place of Solor.

SOLSTICE (Lat. *solstitium*, from *sol*, sun, and *sto*, I stand), that point in the ecliptic at which the sun is furthest removed from the equator, and where he is consequently at the turning-point of his apparent course. There are two such points in the ecliptic, one where it touches the tropic of Cancer, the other where it touches that of Capricorn. The former is the summer, and the latter is the winter solstice to those who inhabit northern latitudes, and *vice versâ*.—The term is also employed to signify the time at which the sun attains these two points in its orbit, viz., June 21 and Dec. 21.

SOLT, a t. of Hungary, county of Pesth, 48 m. s. of Pesth, in a marshy district on a branch of the Danube. Pop. '90, 6502.

SOLUTION. A substance is said to undergo solution, or to become dissolved, when the force of adhesion between it and a liquid in which it is immersed is sufficient to overcome the force of cohesion between the solid particles. Thus sugar or salt is dissolved by water, camphor, or resin by spirit of wine, and silver by mercury. The liquid which effects the solution is termed the *solvent*, or sometimes the *menstruum*; and some solutions have special names—for example, the term *syrup* is applied to a solution of sugar in water, and *tincture* to a solution of a solid in alcohol. If a solid body be introduced in successive small portions into a definite quantity of a liquid capable of dissolving it, the first portions disappear the most rapidly, and each successive portion dissolves more slowly than its predecessor, until a point is reached at which the liquid ceases to possess any further solvent power. When this occurs the forces of cohesion and adhesion are balanced, and the liquid is said to be *saturated*. Solution is promoted by increasing the extent of surface in a solid, or by reducing it to powder. An elevation of temperature, by diminishing cohesion, will generally also increase the solvent power of the liquid; but there are exceptions to this rule—as for instance, in the case of lime and its salts, water just above the freezing-point dissolving nearly twice as much lime as it does when boiling. A compound of lime and sugar, very soluble in cold water, is separated from the solution almost completely if heated to boiling. But the most remarkable case of the kind occurs in sulphate of soda (Glauber's salt), which in its crystalline form dissolves in about ten times its weight of ice-cold water, and rapidly becomes more soluble as the temperature rises until it reaches 91° ; from this point until the solution boils the solubility slightly decreases, the boiling liquid only retaining about four-fifths of the quantity which was dissolved at 91° . Carbonate and seleniate of soda, and sulphate of iron,

exhibit the same peculiarity in a less marked degree. "These anomalous results may be partly explained," says Dr. Miller, "by the consideration that heat diminishes the force of adhesion as well as that of cohesion. Generally speaking, cohesion is the more rapidly diminished of the two, although not uniformly so; and in these cases it would appear that the adhesive force decreases in a greater ratio than the cohesion of the saline particles" (*Chemical Physics*, 3d ed. 1863, p. 72). The accompanying diagram shows the

unequal solubility of various of the more common salts in water of different temperatures. The lines of solubility cut the verticals raised from points indicating the temperature upon the lower horizontal line, at heights proportional to the quantities of salt dissolved by 100 parts of water. For example, 100 parts of water dissolve—at 32°, 8 parts, at 122°, 17 parts, and at 212°, 26 parts of sulphate of potash. Water which has been saturated with one substance—that is, which refuses to dissolve any more of that substance, will often continue to dissolve others.

In true or simple solution the properties, both of the solid and the solvent, are retained. When, however, any chemical action ensues between the solid and the liquid, the resulting solution commonly presents perfectly new and distinct features; as, for example, when the metals are dissolved by acids, or oils by the alkalies (as in soap-making). For the solubility of the gases in water we must refer to the article GASES.

The uses of solution in laboratory processes are numerous. By the difference in degree of their solubility we can separate one substance from another; and by dissolving a body we can purify it, either by filtration or crystallization. Moreover, when it is required that two bodies shall react on one another, they do so with incomparably more force in their dissolved than in their solid state.

SOLVENT. See SOLUTION.

SOLWAY FIRTH—in its upper part best regarded as the estuary of the river Esk; in its lower, as an inlet of the Irish sea—separates the n.w. of Cumberland from the s. of Scotland. Its entire length, until lost in the Irish sea, is calculated at 33 m.; its average breadth for the first 12 of these is not more than 2½ m., but afterwards it gradually, although irregularly, increases to upward of 20. The principal rivers flowing into it, besides the Esk, are the Annan, Nith, Dee, and Urr, from the n. or Scottish side; and the Eden and Derwent from the s. or English side. The spring-tides are peculiarly swift and strong—the wave rushing in from 3 to 6 ft. high, and at the rate of 8 to 10 m. an hour, occasionally inflicting serious damage on the shipping; while after it has retreated, great stretches of the bed of the firth are left bare, and in some places one can even cross over from the English to the Scottish shore. The salmon fisheries of the Solway are valuable.

SOLWAY MOSS is a district of Cumberland, about 7 m. in circumference, lying w. of Longtown, and immediately adjoining Scotland. As its name implies, it was once a bog, but is now drained and cultivated. It is historically notable as the scene of a battle between the English and Scots in 1542, when the latter were defeated. Here also, on Nov. 13, 1771, an extraordinary disaster occurred. The boggy ground, surcharged with moisture—the effect of heavy rains—rose, swelled, and burst like a torrent, sweeping along with it trees and houses, and destroying some 30 small villages.

SOLYMAN (SULEIMAN) II., surnamed "THE MAGNIFICENT," the greatest of the Turkish sultans, was b. in 1490; and in Sept., 1520, succeeded his father, Selim I. (q.v.), who had carefully initiated him into the secrets of Ottoman policy. At the commencement of his reign, he restored a large amount of unjustly confiscated property, and removed from office all who were unfit for the proper discharge of their duties. After having suppressed the revolt of the governor of Syria, he exterminated the Egyptian Mamelukes, and concluded a treaty with Persia. The foolish insolence of the Hungarian court next drew him thither with a powerful army, and Belgrade, the key of that country, was captured (1521). He next drove the knights of St. John from Rhodes (1522); and for 3 years following devoted himself to improvements in the administration; but his attempts at military reform provoked a rebellion of the janizaries, which he saw no other means of quelling than by engaging them in a war with Hungary. He gained the

signal victory of Mohacz (1526), and continuing his resistless course, took Buda and Pesth; but he was recalled by the news of a rebellion in the e., and retreated down the Danube to Constantinople, committing frightful ravages on the way. In 1529 he was summoned to Hungary in aid of his protégé, king John Zapolya, who was contesting the crown with Ferdinand, and accordingly invaded that country with a mighty army, capturing and destroying as he went, and laid siege to Vienna, but after various unsuccessful assaults, he was compelled to retreat. Two years afterward (1531), he again appeared in Hungary; but his progress this time was checked by Charles V. in person, who had come with the imperial army of 250,000, in aid of his brother. In 1535 he concluded with Francis I. the famous treaty which opened the commerce of the Levant to the French flag alone. In 1540 the long and desultory contest between the Turks and Imperialists for Hungary was ended in favor of the former, who took complete possession of the country. After this, the alliance between the French and the Turks began to bear fruit; the combined fleets ravaged the Italian coasts, and pillaged Nice (1542); but peace was again restored with Germany in 1547. The Turks were now supreme in the Mediterranean; Gozzo and Tripoli fell into their hands, and the conquest of the Banat of Temeswar (1551) assured them a firm hold over Hungary. A second and third war with Persia, which was now in a state of semi-subjugation, the bloodthirsty ambition of his favorite wife Roxolana, who succeeded in persuading him to put to death the children of his other wives, a brilliant naval victory (1561) over the knights of Malta and their allies the Spaniards, an unsuccessful blockade of Valetta in Malta (1565), and a fresh expedition to Hungary (1566), were the chief events of the remainder of his reign. During this last expedition, while besieging the little town of Szigeth or Szegedin, which resisted all his attacks, he died on Sept. 5, 1566.

SOMA ("the moon-plant," or *asclepias acida*) is, in the Vedic hymns, the god who represents this plant, and one of the most popular deities of the Vedic religion. The reason for this popularity must be sought for in the important part which the juice of the Soma-plant played in the great Vedic sacrifices, and probably also in its alcoholic and invigorating properties, which the sacrificer experienced when he drunk of it in the exercise of his functions. These properties are constantly described or alluded to in the hymns addressed to Soma. Thus, in some hymns, Soma is said to exhilarate Varoun'a, Mitra, Indra, and the other gods who partake of its juice; and in another, the worshippers exclaim: "We have drunk the Soma; we have become immortal; we have entered into light; we have known the gods. What can an enemy now do to us, or what can the malice of any mortal effect?" In other passages, the juice of the Soma is said to be a draught of immortality, medicine for the sick, and a remedy for blindness and lameness. Thus Soma became endowed with supernatural qualities and divine attributes, and gradually was exalted as one of the most powerful deities. He is the friend, helper, and soul of Indra; he is the slayer of the cloud-demon Vrîtra, the destroyer of foes, the dispeller of darkness, the creator of the sun, the upholder of the sky, and the sustainer of the earth, the king of gods and men; he is thousand-eyed, the most heroic of heroes; he is wise, strong, energetic, etc. See the interesting article on Soma by John Muir, in his "Contributions to a Knowledge of the Vedic Theogony and Mythology," in the *Journal of the Royal Asiatic Society*, new series, vol. i. pp. 135, ff. In the classical period of Hinduism, Soma ceases to be worshiped in the character which he has at the Vedic period; he then becomes the god of the moon. This transition from Soma, the plant and its juice, to Soma, the moon, which is perceptible even as early as in the S'atapatha Brâhmana of the White Yajurveda (see VEDA), is apparently due to the belief, that *Amrîta*, the beverage of immortality, was guarded by the moon, and to the circumstance that, in the Vedic hymns, Soma is frequently called or described as *Amrîta*. The myths connected with Soma, the moon, are wholly different from those relating to the Vedic Soma. As moon, Soma was born from the eyes of Atri, a son of Brahman, the first god of the Trimûrti (q.v.); and became installed by Brahman as the sovereign of plants, Brâhman'as, and planets. But after he had acquired extensive dominion, he became arrogant and licentious, and carried off Târâ (lit., a star), the wife of Vrîhaspati, the preceptor of the gods. Vrîhaspati seeking to recover his bride, and some of the gods siding with him, and others with Soma, a war broke out, which ended in Târâ's being restored to her husband. The result, however, of her stay with Soma was the birth of a son named Budha, who became the ancestor of a dynasty of kings, called the lunar dynasty. See SÛRYA.

SOMALI LAND, or SOMAULI, an extensive maritime country in the e. of Africa, is triangular in shape, and is bounded on the n. by the gulf of Aden, on the s.e. by the Indian ocean, and on the s.w. by the Jub river. From the middle course of the Jub to cape Guardafui, which forms the apex of the triangle, the distance is nearly nine hundred miles. The area of the country is estimated at 330,000 sq.m.; but as great part of its interior still remains unexplored, the number of its inhabitants has not been ascertained. An agreement was concluded in 1894 between the English and Italian governments, which gave definite limitations to their provinces. The Jub, which forms the s.w. boundary, is a large fertilizing stream, drawing its waters from the mountains of southern Abyssinia, and flowing s.e. between the territories of the Gallas on the w. and those of the Somali on the e., to its mouth on the northern frontier of Zanzibar.

The present Somali race were originally Arabs, who landed on the African shore s. of the gulf of Aden early in the 15th century. Driving back the earlier inhabitants of the country, who were Christians, the Moslem made themselves masters of the country. The inhabitants are extremely violent and quarrelsome in their disposition, are notorious for cheating and lying, and for the most part pursue a wandering, pastoral life. The chief trading place is Berbera, on the n. coast; and the products of the country are sheep, cows, ghee, grass-made mats, ostrich feathers, and hides. These are exchanged at the ports for cloth, dates, rice, beads, and iron. Berbera and the north coast became Egyptian in 1875. See *illus.*, ZANZIBAR, ETC., vol. XV.

SOMATOLOGY. See MATTER; ATOM; ATOMIC THEORY; FORCE (CONSERVATION OF); PERCEPTION.

SOMBRERERE TÉ, a t. of Mexico, in the state of Zacatecas, and 100 m. n.w. from Zacatecas, in a mountainous district celebrated for its rich silver mines from which Sombrerete derives all its importance. Pop. '92, 7900.

SOMERS, JOHN, Lord, 1652-1716; b. Worcester, England; graduated at Trinity college, Oxford; became a lawyer, 1676, pursuing at Oxford classical, historical, and judicial studies; commenced practice at London, 1682, and became a leader of the whigs; of counsel for the seven bishops, 1688; member of "Convention Parliament," and solicitor-general, 1689; attorney-general, 1692; keeper of the great seal, 1693; a lord justice, 1695; lord chancellor and raised to the peerage, 1697; removed from chancellorship, 1700, and arraigned for trial before the house of lords, but prosecution having been withdrawn, recovered his influence at court, and was chosen president of the Royal society, 1702; president of the council, 1708-10; and spent the remainder of his life in comparative retirement.

SOMERSET, a co. in w. Maine, adjoining Canada; drained by the Waloostock, Penobscot, and Kennebec rivers; traversed by branches of the Maine Central railroad; about 3664 sq. m.; pop. '90, 32,627 chiefly of American birth. The surface is in part hilly, and there are extensive forests from which much lumber is taken for export. Co. seat, Skowhegan.

SOMERSET, a co. in s.e. Maryland, bounded on the n. by the Wiscomico river, on the s.e. by the Pacomoke river, and on the w. by Chesapeake bay; crossed by the New York, Philadelphia, and Norfolk railroad; about 365 sq. m.; pop. '90, 24,155, with colored. The surface is level and heavily timbered. The soil is sandy. The principal productions are corn and oats. Co. seat, Princess Anne.

SOMERSET, a co. in central New Jersey, bordered by the Passaic on the n.e., and on the w. by Lamington river; crossed by the New York and Philadelphia, the Central New Jersey, and Lehigh Valley railroads, and by the Delaware and Raritan canal; drained by the Passaic and Millstone rivers, and by branches of the Raritan; 303 sq. m.; pop. '90, 28,311. The surface is partly hilly and the soil fertile; the principal products are wheat, corn, potatoes, oats, wool, flax, butter, and cattle. It has good water-power and contains manufactories of agricultural implements, castings, and pig-iron; also tanneries, distilleries, flour and saw-mills. Co. seat, Somerville.

SOMERSET, a co. in s.w. Pennsylvania, adjoining Maryland; drained by the Youghiogheny and Castleman rivers; traversed by the Baltimore and Ohio railroad; about 1106 sq. m.; pop. '90, 37,217, chiefly of American birth. The surface is hilly, but very fertile; flax, wheat, rye, potatoes, corn, butter, and maple sugar are staples; sheep grazing is extensively carried on. Iron ore, bituminous and cannel coal are found. Co. seat, Somersett.

SOMERSET HERALD. See HERALD.

SOMERSET HOUSE, in the Strand, London, stands on the site of a palace built by the protector Somerset about 1549, which fell to the crown on Somerset's execution. The original Somerset House was pulled down and rebuilt in 1776, after designs by sir William Chambers, in the Palladian style for public offices. Various offices connected with the navy and other public departments were removed there in 1788; and in 1813 the east wing was completed to form King's college.

SOMERSETSHIRE, a maritime co. in the s.w. of England, is bounded on the n.w. by the Bristol channel, and in other directions by Devonshire, Dorsetshire, Wilts, and Gloucestershire. Area, 1,043,485 acres. Pop. '91, 484,337. Its form is oblong, its length being about 80 m., and breadth about 36. The surface is extremely diversified, there being every variation, from lofty hills and barren moors to rich vales and marshy "levels," many thousands of acres of the latter being below high-water mark, and depending for security on sea banks and sluices. The hills are divided into several ranges running from e. to west. One range, known as the Mendips (q.v.), runs from near the city of Wells to the coast at Brea-down. South of these hills is a vast marshy plain, on which the Polden hills stand out abruptly like an island. Another conspicuous group, called the Quantocks, rise near Taunton and attain a maximum elevation of 1262 feet. And finally, in the extreme w., is the wild district of Exmoor forest, composed almost entirely of barren hills, the highest of which, Dunkery beacon, is 1709 ft. above the sea level. The rivers of the county rise chiefly in these high grounds, and

are none of them of any magnitude except the Bristol Avon, which rises in Wiltshire, and for some miles divides Somersetshire from Gloucestershire. The Paret drains the middle districts and is a tidal stream up to Bridgwater, presenting at spring-tides the peculiar phenomenon called the "bore." The soil is mostly fertile, and the pasture-lands are almost unrivaled for their luxuriance. The wheat and barley grown around Bridgwater are famous; but grazing and dairy farming form the great objects of husbandry, and the cheese of Cheddar has a great reputation. Cider is also produced in enormous quantities, but owing to the prevalence of small farms agriculture is in a backward state. The hilly districts are rich in minerals, especially iron, with some lead and freestone; and the Radstock and Bedminster coal-fields supply the northern districts with excellent fuel. Oolite is largely developed in the neighborhood of Bath, where a beautiful building stone is extensively produced. The principal manufactures are woollen cloth, coarse linens, lace, silk, and gloves; and there are a number of potteries and breweries, and some printing works. The medicinal springs are an important feature of the county, having been the means of bringing into celebrity and sustaining the splendor of Bath (q.v.). Weston-super-Mare, containing at the beginning of the century a few hovels, is now one of the finest watering-places on the western coast. The parliamentary boroughs are Bath and Taunton; the cities are Bath and Wells; and besides these there are four other towns, Bridgwater, Chard, Glastonbury, and Yeovil, which are municipal boroughs. In ancient times this part of the kingdom was inhabited by the *Belgae*, and the Mendips appear to have formed so strong a barrier against the Roman and Saxon that even to this day philologists can trace the strong Celtic element that held its ground here. British camps are very numerous on the hills, and extensive remains of stone circles are visible at Stanton Drew, near Bristol. In Saxon times Somersetshire was one of the earliest counties to embrace Christianity; and, while a church was founded at Wells in 704 on the site now occupied by the fine cathedral, a monastery was founded at Glastonbury, which eventually became one of the wealthiest in the kingdom. Somersetshire was the principal arena of the rebellion of the duke of Monmouth in 1685.

SOMERS ISLANDS. See BERMUDAS.

SOMERSWORTH, a city in Stafford co., N. H.; on Salmon Falls river, and the Boston and Maine railroad; 74 miles n. of Boston. It was incorporated as a parish in 1729 and as a town in 1754 and was chartered as a city in 1893. It has a high school, a manufacturers' and village library, electric lights, electric street railroads, waterworks supplied from the river, national and state banks, weekly newspaper, and saw mills, cotton and woollen mills, and shoe factories. Pop. '90, of the town, 6207.

SOMERVILLE, a city in Middlesex co., Mass.; on the Mystic river and the Fitchburg and branches of the Boston and Maine railroads; adjoining the cities of Boston, Cambridge, Everett, and Medford. It was incorporated as a town in 1842 and chartered as a city in 1872, and contains nearly a dozen villages. There are English and Latin high schools, public library, hospital, Home of the Little Sisters of the Poor, Broadway, Central Hill, and Nathan Tufts parks, electric lights, and street railroads, water supply from the metropolitan system of Boston, and national, savings, and co-operative banks. The principal industrial plants are extensive slaughtering and meat-packing establishments, tube works, tanneries, flour mills, iron foundries, and desk factories. Pop. '90, 40,152.

SOMERVILLE, Mrs. MARY, a lady famed for her mastery of mathematics and physical science, was the daughter of admiral sir William Fairfax. She was b. at Jedburgh on Dec. 26, 1780, and brought up at Burntisland, amid somewhat narrow family circumstances. Her mother taught her to read; but besides this, she had no education till she was nine years old. At ten, she went for a year to a school at Musselburgh; and on her return, took more delight in reading whatever came in her way than in sewing, to the great discomfort of her relatives. After she was thirteen, she twice had, during a sojourn in Edinburgh, an opportunity of attending classes, studying music, drawing, and a little Latin, and of mixing with Edinburgh society. It is somewhat singular that it was in an algebraic sum in a magazine of fashions that Mrs. Somerville first made her acquaintance with the subject that most engrossed her attention later in life. In 1804 she married Mr. Greig, a commissioner in the Russian navy, and removed to London. Although Mr. Greig did not prevent her from continuing her studies, he himself had no interest in science, and had the usual prejudices against learned women. It was not till her return north as a widow, after three years of married life, that she was free to buy the books she wanted, and to study the subject that most interested her. She was now 33 years old, with two children. In 1812 she married her cousin, Dr. William Somerville, who entered warmly into all her ideas. Her husband and she removed to London in 1816, where Mrs. Somerville went much into society, and became known as possessed of scientific interests and gifts. In 1823 Mrs. Somerville was invited by lord Brougham to try to popularize, for the English public, Laplace's great work, the *Mécanique Céleste*. This she was persuaded to undertake, and published it as the *Celestial Mechanism of the Heavens*, in 1830. The work was received with the greatest admiration. Mrs. Somerville was awarded a royal pension in 1855. *The Connection of the Physical Sciences* was

published in 1835, and has passed through nine editions. Her next work was *Physical Geography* (1848), of which there have been six English editions. *Molecular and Microscopic Science* appeared in 1866. Mrs. Somerville, who for many years resided in Italy, died at Naples, Nov. 29, 1872, having maintained till the end the perfect use of her faculties. An autobiography, edited and supplemented by a daughter of Mrs. Somerville, was published in 1873.

SOMERVILLE, WILLIAM, 1677-1742, b. Warwickshire, England, of good family; educated at Oxford university. He afterwards resided on his ancestral estate as a country squire and wrote *The Chase and Field Sports*, both poems, and also fables and tales of some merit.

SOMMA VESUVIANA, a town in the province of Naples, Italy, 9 m. e. of Naples. Pop. '81, 8511.

SOMME (anc. *Samara*), a river of northern France, rises near Font-Somme, in the department of Aisne, and falls into the English channel midway between Boulogne and Dieppe. Its entire length is about 152 m.

SOMME, a maritime department in the north of France, s. of Pas-de-Calais, and n.e. of Seine-Inférieure. It has an area of 2379 sq. m., and a pop. '96, 543,279. Somme is for the most part quite level, and in some parts marshy. The department produces abundance of corn and garden-fruits; also beet-root, oil-yielding plants, and splendid carrots. The rearing of cattle is carried on to a great extent. The chief manufactures are velvets, chemicals, woollens, cottons, linens, silk, leather, and tapestries.

SOMNAMBULISM (Lat. sleep-walking). Walking in sleep is the most palpable, but not the most marvelous characteristic of this condition. The person affected walks, rides, climbs, with the eyes shut or insensible; his movements are precise, cautious, leading him into positions of difficulty and peril, which, if perfectly alive to their real nature, or if acting under the influence of ordinary motives, he would avoid; and yet there appears to be a partial consciousness of surrounding objects, and an adaptation to circumstances. Individuals have, while in this state, performed long journeys on foot or horseback, paying tolls, avoiding obstacles; they have successfully descended into coal-mines; they have ascended in safety to the roofs of houses, have climbed rocky cliffs, and successfully robbed eagles' nests, during the night; millers, saddlers, grooms, seamstresses, have all performed their customary work with perfect exactitude, but without any recollection of their exertions or industry. Notwithstanding the accuracy with which many acts are performed, that particular senses may be dormant is proved by insensibility to loud noises, and by a cook eating cabbage which had been substituted for a salad which he had carefully and artistically prepared. The senses, in relation to the idea or train of ideas present to the mind, appear to be awake, and preternaturally acute. This fact has suggested the hypothesis, that certain faculties are wakeful, open to impressions, and actuated by volition; while others, and the mind in general, are plunged in profound sleep and unconsciousness. This may be true, and is in harmony with the opinion, that the phenomena are an acted dream or delusion, and that what is seen, heard, or done, is the mere embodiment or repetition of former impressions or impulses, at the time before the mind. This may be illustrated by the case of the student narrated by the archbishop of Bordeaux, who composed a sermon and wrote out music while asleep; read them over, made corrections, scratched out lines, substituted others, put in its place a word that had been omitted, and continued to do all this, although a sheet of pasteboard was interposed between the writing and his face; showing that he was copying mental images, and not with the eye.

Somnambulism occurs in the sensitive and excitable, often in conjunction with other nervous affections, and is hereditary; so that it may be regarded as on, if not within, the boundary of disease.—Herbert Mayo, M.D., *On the Truths contained in Popular Superstitions*; Macnish, *Philosophy of Sleep*; Binns on *Sleep*.

SOMNAMBULISM, ARTIFICIAL. See HYPNOTISM.

SOMNAUTH, or **SOMNATH-PUTTEN**, a t. of Guzerat, in Hindustan, is situated on the s.w. coast of the peninsula of Kattywar (q.v.), about 33 m. from its southern extremity, and had in 1881 a pop. of 6644, most of whom were Mohammedans. The town is fortified by a strong stone wall 9 ft. thick, strengthened by 38 towers; it contains many mosques, and the ruins of the celebrated Hindu temple of the idol Somnauth. The ruins of the temple are in a state of fair preservation, and give the idea of its having been a gloomy, massive temple in the form of an oblong hall 96 ft. by 68 ft. crowned by a magnificent dome, and covered on the inside and outside with elaborate sculpture and carving illustrative of mythological subjects. The splendor of this temple has doubtless been much exaggerated by various travelers; but a thousand years ago it was so famous as a place of pilgrimage for pious Hindus, as well as for its immense wealth—the accumulations of centuries of presents—that it attracted the zealous idol destroyer, Mahmud of Ghizni, after he had accomplished his self-imposed mission of conquest, spoliation, and conversion in the rest of northern India. In 1024 he appeared before Somnauth drove its defenders—who at first had been buoyed up with sanguine hopes that their favorite god had drawn the Mohammedans hither that he might blast them with his wrath—to take refuge in the temple, where they defended themselves with such valor that Mahmud's army was forced to retreat; but the sub-

sequent rout of two Hindu armies which had advanced to the aid of the sacred city, so dispirited the defenders that Somnauth was immediately surrendered, the idol destroyed, and the enormous wealth of the temple, consisting chiefly of precious jewels, carried off along with the gates of the temple. These gates, which are said to have been made of sandal-wood, were brought back from the entrance to Mahmud's tomb in Afghanistan by the British in 1842, and their recovery announced in a magnificent proclamation, which called upon the chiefs of Sirhind, Rajputana, Malwa, Guzerat, to transmit them "with all honor" to the place whence, eight centuries ago, they had been violently removed. They were, however, never restored to Somnauth, as the home authorities disapproved of the tenor of the proclamation, fearing that it might stimulate religious animosity between the two great religious bodies of Hindustan. There was also reasonable ground of doubt as to whether the gates were really the original gates of Somnauth and even whether (since the *Ferishta* does not mention the circumstance) Mahmud had taken away any gates. The repute of Somnauth as a place of religious pilgrimage, and its wealth, revived some time after its spoliation by sultan Mahmud, to such an extent as frequently to attract the various Mohammedan robber-princes of western India; and it is still at the present day a chief resort of pious Hindus from all quarters, who pay a small tribute to the Guicowar for liberty to perform their devotions at this favorite shrine.— See Price's *Mohammedan History*, vol. ii.; Dow's translation of the *Ferishta*; Mirkhond's *Rauzat-al-safa*; sir John Malcolm's *History of Persia*, vol. i.; and Smith's *Life of Dr. John Wilson* (1878).

SONATA, a word supposed to be derived from the Italian *sonare*, to sound. It was first applied to a musical composition about the beginning of the 17th century, and as an antithesis to cantata, the musical work that was sung. The whole process of the development of the sonata as an art-form from its crudest beginnings to its highest culmination took nearly two hundred years. In its infancy it resembled the suite-form, and for a time was almost identical with it, but the sonata gravitated from pure dance-forms, which the suite embodied, and toward more complicated conditions. The different movements in a sonata came to represent different origins and types of music. The violin sonata attained first to perfection, since that instrument had so great an advantage over the early keyed instruments, and in it the slow introductory first movement generally shows traces of ecclesiastical influence; the second, an allegro, corresponding to the first movement of the modern sonata, was derived from the vocal madrigals, or part-music; the third, the characteristic slow movement, from solo vocal music, such arias from cantatas, or operas; and the last movement showed elements of dance-music, which was therefore a pure suite movement. In the first attempts to form an aggregate of distinct movements, the composers had to take their forms wherever they could find them. For a long while familiar dances held their place in the group of movements. The minuet survived the longest, but was ultimately supplanted by the Scherzo, and the Gigue and Chaconne, of which Bach left so many examples, was succeeded by the Finale, or Rondo. It is not known who first experimented in sonatas of distinct movements. The Italian names of Farina, Cesti, Frescobaldi, and Colonna, Rosenmüller among the Germans, and John Jenkins and Henry Purcell in England are among the first composers of the sonata. An awakening sense of the relation and balance of keys is seen in a set of seven sonatas for the clavier by Johann Kuhnau, called *Frische Clavier Früchte* (1703). Johann Mattheson chooses the Gigue as the concluding movement of his sonatas, and defines its form, and Alessandro Scarlatti (1659-1725) imparts a greater degree of unity. Albinoni, Alberti, Dr. Croft, Nicolo Porpora, Durante, and Domenico Scarlatti produced many original ideas. The works of Corelli are most valuable. He wrote 24 *Sonate da Chiesa* for strings, lute, and organ, 24 *Sonate da Camera* for the same, and 12 for the violin, violoncello, or cembalo. The domain of the sonata was long monopolized by writers for the violin, and advances were made by Locatelli, Geminiani, and Tartini until the sonata finally settled into the four-movement type. John Sebastian Bach wrote many sonatas for various instruments, and for combinations of instruments, some of which he described as sonatas, or suites, but he stands apart from the direct development of the sonata. With Haydn the structure of the sonata-form is established, although they are not especially interesting, owing to the meagre capabilities of the clavier of his day. He clearly marked the outlines, and made the use of the minuet and the rondo imperative. Mozart adds to Haydn's dry form, symmetry, grace, and more mature and elaborate themes and harmonies. Clementi and Dussek fill in the period between Mozart and Beethoven, who brought the sonata to its perfection. His early sonatas follow with new aspects Mozart's and Haydn's, but they gradually expand into works of enormous proportion. In such sonatas as the *Kreutzer*, for violin and pianoforte, and the pianoforte sonatas in D minor, op. 31; C major, op. 53; F minor, op. 57; B-flat, op. 106, and C minor, op. 111, he attains to such a command of technical resource and art expansion that his mastery seems almost superhuman. His sonatas regarded as a whole are the most valuable of all compositions for the pianoforte. A modern sonata is usually constructed on the following plan: the first movement, an allegro with two themes, each capable of varied treatment; the second, usually slow, in any time between Adagio and Andante; the third, a Minuet, or Scherzo; and the last a brilliant finale in the Rondo form. Schubert, Weber, Mendelssohn, Chopin, Liszt, Brahms, and Grieg have composed interesting and beautiful sonatas, but no composer has attained the height reached by Beethoven.

SONCHUS. See **SOW THISTLE**.

SONDERSHAUSEN, the capital of the principality of Schwarzburg-Sondershausen, pleasantly situated on the Wipper, 33 m. n.w. of Weimar. Pop. '95, 7013.

SONDRIO, a province in Lombardy, Italy; bounded by Switzerland on the n., Tyrol on the e., and Como, Brescia, and Bergamo on the s., drained by the Adda river; 1232 sq. m.; pop. '95 (est.), 134,624. The valleys of Valtellina, 45 m. long, and Chiavenna, form the greater part of the province. Some of the loftiest summits of the Rhetian Alps, are on the n. boundary, and include the celebrated passes of Splügen, Bernina, and Stelvio, the last being the highest, over which carriages pass. Excepting the marshes bordering lake Como, the soil is fertile, yielding fine crops of grain and fruit, particularly grapes, which are manufactured into wine. The Sondrio cheese is particularly fine. The province contains iron and marble. Capital, Sondrio.

SONG, a short poem intended for music, and a musical setting of a short poem or bit of prose. The term belongs to both music and poetry. The song may be divided into two classes, the artistic song written by poets and polished with conscious art, and the national, or popular song, such as the Volkslieder of Germany and the ballads of England. In some countries the development of the national song can be distinctly traced from the folk-song to the finished composition; in others, it remains clad in its primitive garb, for the song is that branch of music in which national peculiarities and local color linger the longest. The true song had no existence before the time of the Troubadours, in the 11th century, who gave it form with their graceful lyrics and rhythmical tunes. Their southern temperament and chivalry inspired the early songs with the theme of love. Satires, panegyrics, exhortations to the crusades, and religious odes were also written. Different songs had different names; in the *pastourelle* the poet would woo a shepherdess; the *alba* and *serena* were morning and evening songs; the *tensions* were dialogues of wit or gallantry; the *sercente*, an address from the lover to his mistress; the *canzo canzone*, the *soula*, a merry song; the *lai*, with its melancholy, the *carol* and the *ballata* all sprang from the Troubadours. A class of versifiers arose in southern France called Trouveres, and in Spain called Trobadores. Their system of notation was the same as that of the Troubadours, and the flame spread also to Italy, which had her Trovatori and Giocolini. But they wrote in the Provençal language until Dante proved the capacity of Italian. The development of the song in France was carried further by the *chansonniers* of the 13th century. Adam de la Halle (1240) wrote chansons for his *Robin et Marion*, which are similar in structure to those of the present day, and Guillaume Marchaud (1285) was renowned for his graceful balletes, or dance-songs, and numerous lais, virelais, ballades, and rondeaux. The influence of the church is distinctly felt in the 14th and 15th centuries, and many popular tunes were absorbed by it for themes for masses and motets. This use of secular music for ecclesiastical purposes is illustrated in the works of Clement Marot. Subsequently romances came into vogue, and in 1830 the lyric song in the hands of Alfred de Musset, Béranger, Victor Hugo, and Lamartine reached its height. In Paris the songs of the hour are from the opéras comiques, but in the provinces the national airs still exist. The songs of Auvergne are chiefly bourrées; in Burgundy, Noëls and drinking-songs; The Béarnois airs are melodious and pathetic; and in Normandy mill-songs predominate. See *Chanson*. The history of the song in Spain and Portugal is meagre, for although Spanish literature is rich in remains of ancient poetry, little music is preserved. Their songs consist chiefly of traditional street-ballads and dance-songs. In Italy the sonnets of Dante and Petrarch were among the first poems set to music. Ballate and Intuonale, love-songs and dance-songs; Maggiolate, May-day songs; and carnival songs had their day of popularity. In the 15th century the Netherland school influenced Italian music towards the church, and only such songs as the Frottole, Villanelle, and Villotte prevailed. Madrigali, canzoni, and arias for one voice came into fashion, and canti popolari occupied a place similar to that of the Volkslied in Germany. Italian energy spent itself in the opera and cantata, so that the song drifted into the aria, and the best songs of Italy are to be found imbedded in large works. The English song began with the bards, minstrels, and gleemen, who improvised the tunes to their recitations. In the 15th and 16th centuries social and political ballads multiplied. The most popular of Queen Elizabeth's time were: *The Carman's Whistle*, *Greensleeves*, *The British Grenadiers*, *Near Woodstock Town*, *The Bailiff's Daughter of Islington*, and *The Frog's Galliard*. In the 17th century the partiality for airs and dialogues was derived from the influence of Italian recitative, and it also became the custom to write new ballads and songs to old airs, a practice which Burns followed. Many ballads were sung in the reign of Charles II., such as *Barbara Allan*, *Come, lads and lasses*, and *Lillibulero* (q.v.). Between 1683 and 1690 are the names of Henry Purcell, John Eccles, and Richard Leveridge, the latter of whom wrote the famous *Black-eyed Susan* and *The Roast Beef of Old England*. A multitude of ballads appears in the 18th century. Besides giving his country *Rule Britannia* (q.v.), Dr. Arne set many of Shakespeare's songs with taste. Samuel Webbe, William Jackson, and Samuel Arnold fill the intervening space until Charles Dibdine is reached, whose *Tom Bowling*, and other sailor songs became so popular. To the same period belong John Percy's *Wapping Old Stairs*, James Hook's *'Twas Within a Mile of Edinboro' Town*, Charles Horn's *Cherry Ripe*, Bishop's *Should he*

Upbraid and Bid me Discourse, Mrs. Jordan's *Blue Bells of Scotland*, etc. Of modern English composers, Sir Arthur Sullivan, Hubert Parry, C. V. Stanford, Cowen, Molloy and Barnby are the leading song-writers. The school of Scandinavian music is comparatively recent. Lyric songs are rare, but the *Volkslied*, epic-songs, and herdsman's songs still exist, and are chiefly in the minor keys. The scale recalls the Mysolydian and Phrygian modes. All of the melodies bear strong national stamp, and are weird and romantic. Grieg, Gade, Svendsen, and Hartmann have preserved the national airs and songs. The songs of Hungary, Russia, and the Slavonic nations consist chiefly of patriotic and national songs, the melodies of which have been worked over by Rubinstein, Dvöřak, and Tschaisowsky. Germany possesses the most brilliant history of the song, extending from the period of the Minne- and Meistersinger through the *Volkslieder* of the 15th, 16th, and 17th centuries, to the artistic song which has reached its highest development in Schubert, Schumann and Robert Franz. See CHANSON; LIED; MINNESINGER; NATIONAL HYMNS.

The singing of birds is chiefly connected with the love-season; although some birds sing at other seasons also, during fine weather, and when food is abundant, as if merely to utter their happiness, and by uttering, to increase it. It is during the pairing-time that they are most vocal; the singing of many is continued with frequency also during the period of incubation, but with some change of character, exhibited in a marked degree by the chaffinch. The male alone sings. Female birds have voice also, but do not possess the power of warbling like their mates. The song of birds is not produced by the larynx proper, but by the *syrix* or lower larynx, a distinct organ.

There can be no doubt that the singing of the male bird is intended to attract and please the female, and that he delights in this display of his own powers. In this respect, there is no difference between the birds of most melodious song and those of harsh discordant voice. The crowing of the cock and the gobbling of the turkey have the same purpose as the song of the nightingale. In them may be also seen an emulation which is ready further to display itself in combats, and probably these take place among the males of all birds. But questions of rivalry seem in part to be decided among some of the songsters of the groves by mere musical displays. Caged birds evidently often sing from emulation. It is said that canaries may be taught to sing a complete tune from a musical box, adjusted to play one tune only. A mirror should be placed before the bird and over the box.

The imitative powers so remarkably possessed by the mocking-bird and a few other species, are to some extent possessed by many birds.

SONGHAY, or **SURHAI**, a negro nation of the central western Sudan, between the Niger and the Sahara. They are believed to have been in this neighborhood since the middle ages.

SONNEBERG, a t. in Germany in the duchy of Saxe-Meiningen; one of its principal towns; pop. '95, 12,167. It is 13 m. n.e. of Coburg, and manufactures and exports papier-mâché articles. In the vicinity are ledges of slate, which is quarried and made into pencils.

SONNENTHAL, ADOLF VON, an eminent Austrian actor, born in Budapest in 1834. He first worked as a journeyman tailor, but became connected with the court theater in Vienna, where he rapidly rose into such favor that, on the 25th anniversary of his engagement, he was knighted by the emperor—a distinction never before granted to one of his profession. In 1855, on a visit to New York, he was cordially received by his countrymen and the theater-going public. See Eisenberg, *Adolf Sonnenthal* (1896).

SONNET, a poem expressing one idea, mood, or sentiment, and usually extending to 14 decasyllabic lines, with a somewhat intricate arrangement of rhymes. It is one of the most refined forms of poetic expression. Every sonnet should be full and complete, though terse; and be firmly but gracefully rounded off. The oldest extant specimens of the sonnet are those of Vernuccio, of the 12th, and Peter delle Vigne, of the 13th c.; but it received its highest finish at the hands of Dante and Petrarch. In the 16th c. Wyatt and the earl of Surrey introduced the sonnet into English literature, and Sidney, Spenser, Shakespeare, Daniel, Drayton, and Drummond extended its use and scope. In the Italian models, the first eight lines make two quatrains, and the remaining six, two tercets. The quatrains have two rhymes, usually arranged so that the 1st, 4th, 5th, and 8th lines rhyme, as also the 2d, 3d, 6th, and 7th. In the tercets great liberty is allowed; but there are generally three rhymes, arranged in couplets. Shakespeare and Spenser used an illegitimate form. Milton's sonnet was a close approach to the true Italian type. Nearly all of our modern poets have employed this form of poetry. See *The Sonnet*, by Tomlinson; Henderson's *Petrarcha*; Löffl's *Laura*, etc.

SONNINI DE MANONCOURT, CHARLES NICOLAS SIGISBERT, an eminent French traveler and naturalist, born in 1751. Besides a residence for some years at Cayenne, he traveled in Egypt, Greece, the Archipelago, and Asia Minor. He made many valuable researches in natural history, and published several works, the chief being *Voyage dans la Haute et dans la Basse Egypte* (1799), and *Voyage en Grèce et en Turquie* (1801). Sonnini died at Paris in 1812.

SON OF GOD. Considered from the side of dogmatic theology, the phrase Son of God denotes the second person of the Trinity (q.v.). If we examine the use of the name in the Scriptures, we find it to have been applied by Jesus to himself, and given to him by

his disciples, to express the mysterious relationship in which he stood to God. The phrase was one not altogether unknown to the Jews. The plural "sons of God," occurs several times in the Old Testament; in some cases it is applied (tropically) to angels, in others to the children of Israel, and in their collective capacity as the favored nation, they are twice called by God his "son" (Ex. iv. 22, 23; Hosea xi. 1). The use made in the New Testament of the famous passage of the 2d Psalm ("Thou art my Son; this day have I begotten thee") is thought by some to constitute conclusive evidence that the spiritually-minded among the ancient people recognized a "Son of God." It has been argued, however, that if the Hebrews generally, or even their spiritual leaders, had believed the Messiah to be the "Son of God" in any other sense than that he was prophetically filled with the spirit of God, both the idea and the phrase would have played a far more prominent part than they do in the religion and literature of the nation. Nor does it appear that the idea of a "Son of God" (in the divine sense) had rooted itself in the Hebrew mind. Hence we find that the assumption of the title by Jesus provoked the bitterest opposition on the part of the great majority of his countrymen. They did not hate him because he claimed to be the "Messiah," the "Christ;" on the contrary, they were prepared to accept as such any teacher whose words or works might seem to them to justify his pretensions to the dignity; but when Jesus claimed to be the "Son of God," equal and one with the Father, they sought to stone him. It was, in fact, this assertion of his divinity that cost Jesus his life.

SONOMA, a co. in n.w. California, bordered by the Coast range and by San Pablo bay on the s., and on the w. by the Pacific ocean; crossed by the San Francisco and North Pacific and the Southern Pacific railroads; drained by the Russian river and by several creeks; 1548 sq. m.; pop. '90, 32,721. The surface is mountainous, and thickly covered with yellow and sugar pines, and fir and redwood trees. The beautiful valleys of Petaluma, Santa Rosa, and Sonoma are particularly fertile, having fine orchards and vineyards, the latter celebrated for its wine, which is lighter than that produced in other parts of the state, and suitable for champagne. The climate is mild and uniform. The geysers or hot springs are in the n.e. portion of the county. Co. seat, Santa Rosa.

SONORA, a frontier state in the n.w. of Mexico, bounded on the n. by the U. S. territory of Arizona, and on the w. by Lower California and the gulf of California. Area, 76,900 sq. m.; pop. '95, 191,281. Several fine bays indent the coast; lagoons occur near the shore; and in the western part of the state there are several lakes. The great system of the Andes skirts the eastern frontier, and throws off branches which occupy much of the surface of the state. In the w. the surface is mostly flat, with a fertile soil, and a warm but variable climate. The chief rivers are the Rio Colorado, Sonora, Yaqui, and Mayo. Two abundant crops are gathered every year from the same land; and the principal crops are wheat, maize, peas, and beans; though tobacco, sugar-cane, and cotton are also grown. But the wealth of the state is not in its agricultural capabilities, but in its mineral treasures, which are considered inexhaustible. "Hardly a village or grazing estate," writes a recent traveler, "but can show some vein of gold, silver, lead, or copper;" and he thinks that in all probability "not a fourth of its existing metallic wealth is known, while not a moiety of that has been or is being developed." The capital is Hermosillo; Guaymas is the chief port. *

SONRHAI. See **SONGHAY**.

SONSONATE, a t. of Central America, in San Salvador, and 36 m. w. of the city of that name. Pop. '78, 5127, present population estimated at 8000.

SONTAG, HENRIETTE, an eminent German vocalist, was b. in 1806, and educated for the stage. After a brilliant operatic career at Vienna, Berlin, Paris, and London, she married count Rossi in 1828, and left the stage in 1830. Compelled by pecuniary difficulties to reappear in 1849, she met with renewed success both in Europe and America. She died in Mexico in 1854.

SOO-CHOW, or **SU-TCHOU**, or **SOO-CHOW-FOU** (*fou* merely signifying *city*), a large city of China, in the province of Kiang-su, 50 m. w.n.w. from Shanghai. It stands near the Grand canal which connects Hang-chow with Nankin and Peking, but its port is Shanghai, with which also it has water-communication. It is about 10 m. in circumference, and is inclosed by fortifications, outside of which are 4 very large suburbs. The country around Soo-chow is level and remarkable for its fertility, so that the Chinese speak of it as a terrestrial paradise. The city has silk manufactures, printing establishments, and a large trade in books. In 1857 Soo-chow was captured and sacked by the Taepings. In 1863 it was invested by the imperialists, under a British officer, and, the rebel chiefs having surrendered, were treacherously beheaded. Pop. about 500,000.

SOODAN, SOUDAN, or SUDAN, a vast tract of central Africa, bounded on the n. by the Sahara; on the w. by Senegambia; on the s. by Upper Guinea, from which it is separated by the Kong mountains, and on the e. by the Abyssinian highlands. The Niger (q.v.) waters the western regions, and in the e. are lakes Tchad and Fittri. It has an area of over 2,000,000 sq. miles; estimated population from 80,000,000 to 90,000,000.

Iron and copper are abundant, and gold, lead, tin, saltpeter, and sulphur occur. Salt, however, is entirely wanting and has to be brought across the Sahara. Of agricultural products, cotton and indigo are abundant, wheat, rice, maize, and millet are among the ordinary crops. Western and central Soodan are divided into the independent or protected states of Gando, Sokoto, Adamawa, Bornu, Baghirmi, and Waday. Eastern Soodan comprises Darfur, Kordofan, Senaar, Taka, the Equatorial province and the Bahr-el-Ghazal province, which were all under Egyptian rule until 1882, when, owing to bad government, and the excessive greed of the petty governors, who were absolute rulers in their respective provinces, there was among the tribes a very general dissatisfaction with the Khedive's authority. They were eager to avail themselves of any opportunity for riddance of their burdens; and when Egypt's military power became weakened, El Mahdi or "the False Prophet" incited the political and religious insurrection, in which England was compelled to take part by reason of her connection with Egyptian affairs. When Hicks Pasha's army, sent by the Khedive against El Mahdi, was massacred at Obeid, England determined to withdraw from the Soodan; but in the mean time the garrisons at Suakim, Tokar, Sinkat, Kassala, Berber, and Khartoum had been surrendered by El Mahdi's followers. Gordon and Stewart were sent across the desert to reinforce Khartoum; Gen. Graham, with 5000 men, was sent from Suakim to the relief of Tokar, and succeeded in rescuing part of the garrison, but, finding it impossible to cross the desert to Berber, and thence to Khartoum, returned to lower Egypt. Gordon reached Khartoum in the spring of 1884, and after several fights with El Mahdi's troops, was surrounded and cut off from communication with Cairo. In the fall, an expedition under Lord Wolseley was sent by way of the Nile to relieve Gordon, and preparations were made to send a large force, under Gen. Graham, across the desert to Berber; but in Feb. came the lamentable news of the fall of Khartoum and death of Gordon. No fighting of importance was subsequently done, El Mahdi's forces retired, and the English forces were withdrawn. At the death of the Mahdi, one of his lieutenants, Khalifa, succeeded to his power, and has since ruled over the revolting provinces. Of the prisoners captured at Khartoum, one of the most distinguished, Slatin Bey, escaped in March, 1895. In 1896 the severe defeat of the Italians in Erythrea, and the alleged restlessness of the dervishes led the British government to make a demonstration of force from the frontier into the Soodan. After repeatedly defeating and repulsing the dervishes, the expedition finally captured Dongola, Sept. 23. In 1897 the British advance was resumed in July with the purpose of capturing Abu Hamed, in order to make it the temporary terminus of the new railroad which is being pushed across the desert at the rate of about two miles per day. The attack on Abu Hamed took place on Aug. 7, when the Egyptian army won a brilliant victory, driving out the dervishes and occupying the town. Abu Hamed is an important stepping-stone to the recovery of Berber and Khartoum.

SOOLOO' ISLANDS. See SULU ISLANDS.

SOOT is that portion of fuel which escapes combustion, and which is mechanically carried up by the current of hot air, either to be deposited on the sides of the chimney, or to be discharged into the atmosphere. The soot of coal and that of wood in all probability differ materially, the former containing more carbonaceous matter and more ammoniacal salts than the latter. Continued contact with soot often gives rise to a peculiar form of cancer, which is consequently known as *chimney sweepers' cancer*.

SOPHIA, the capital of Bulgaria, 170 m. n.w. of Adrianople, in a plain on the Bogana, a branch of the Isker. It contains numerous mosques, and several Christian churches; is the see of a Greek and a Roman Catholic archbishop, and carries on manufactures of cloth, leather, silk goods, and tobacco. Its hot springs and baths are highly esteemed. Pop. '93, 47,000.

SOPHIA DOROTHEA, 1666-1726; b. Germany; called princess of Ahlden; daughter of George William, duke of Celle, and a French lady. She was celebrated for her beauty; and in 1682 she married George Lewis (eldest son of her cousin, the elector Ernest Augustus of Hanover), who became George I. of England. She was divorced in 1694 on account of her intimacy with Königsmark, a Swedish colonel whom she had known in her youth; the intrigue resulting in the assassination of the adventurer and her banishment for life to the castle of Ahlden near Celle.

SOPHISTS. The Sophists were the leading public teachers in ancient Greece during the 5th and 4th centuries B.C., and their character has been a subject of much dispute. Most of the historians of philosophy—influenced seemingly by the lampoons of Aristophanes, the comic poet, and by the disparaging remarks of Socrates, Plato, and Aristotle, who stood in a quite different position from the teachers by profession—represent the Sophists as "ostentatious impostors, flattering and duping the rich youth for their own personal gain, undermining the morality of Athens, public and private, and encouraging their pupils to unscrupulous ambition and cupidity."

A Sophist, in the original sense of the word (derived from *sophos*, wise or learned), was a wise man, a clever man, one who stood prominently before the public for intellect or talent. Solon and Pythagoras are called Sophists; the name was applied even to great poets. Socrates was repeatedly so designated; Plato is alluded to by the same title. By the general public, any man of intellectual eminence would be spoken of as a Sophist. With the feeling of admiration toward the intellectual class, there was

mixed up a certain invidious sentiment, from whatever cause arising; and the name Sophist being often used to express the dislike as well as the admiration, came ultimately to have a predominating bad sense. Still, the general public, in the use of the word, comprehended Socrates, Plato, and Aristotle, and their philosophical disciples and followers, equally with the professional teachers.

The great intellectual start made in Greece during the 5th c. B.C., led to an advanced standard of general instruction. There had been an established popular education long before—including music, reading, and recitation—but now there were found among the public teachers men of the highest accomplishments that the age could furnish, who taught whatever was known of astronomy, geography, and physics, as well as the newly started controversial discussions in ethics and in metaphysics. These men shared with the other intellectual celebrities the title of Sophist. But there was one circumstance in their case that greatly deepened the invidious sentiment—they taught for pay. This brought them under the odium of two classes: in the first place, the poor, who could not afford the fees, felt themselves in a new position of inequality with the rich; secondly, the philosophers, properly so called, who had not yet begun to receive money from their disciples, held in contempt those that did. Both Socrates and Plato had a vehement repugnance to the idea of a money-bargain between master and pupil; in their eyes, the relationship was one of pure attachment and devotion; and they considered that all the invidious part of the designation Sophist, and more, was richly deserved by the teachers for hire; and as these public teachers, by the nature of their vocation, would probably be often shallow and superficial, as compared with the great philosophers, we can understand the full definition of Sophist by Aristotle—"an imposturous pretender to knowledge, a man who employs what he knows to be fallacy, for the purpose of deceit and of getting money." With all the great authority of Aristotle, this charge applied indiscriminately to the body of men employed in training youth for active life, will not bear investigation. Enough is known of the lives, characters, and doctrines of the class to refute the accusation. The Sophists were a profession growing out of the circumstances, and supplying a want, of the age. The most valuable ideas and habits of any accomplished Athenian were due to his education under some teacher of the class Rhetor or Sophist. So far from the age of the Sophists being an age of corrupted public morality, Mr. Grote contends that it was the reverse. He adduces a multitude of historical facts to prove that the morality of the Athenian public was greatly improved at the end of the 5th c. B.C., as compared with the beginning of that century.

SOPHOCLES, the great master of Greek tragedy, was b. at Colonus, a village about a mile from Athens. The date of his birth is not exactly known, but is fixed at 496 B.C. Sophillus, his father, a man of good birth and fortune, bestowed much care on his son's education; insomuch that, aided by his highly prepossessing appearance, Sophocles was selected for his skill in poetry and music to lead with dance and the lyre, after the victory of Salamis, the chorus of youths in a triumphal pæan composed by himself. In his 28th year he is said to have exhibited his first play; and three years before, in a contest with rival scenic writers, one of whom was Æschylus, he gained the first prize, by the decision of the judges Cimon and his colleagues. He had, by Nicostрата, two sons, and one by Theoris, a Sicyonian woman. Iophon, one of his two sons by Nicostрата, summoned him in his old age before the Phratores, on the charge of incapacity to manage his private affairs, but he refuted the charge by reciting to the court a beautiful chorus from his *Œdipus in Colonus*. He died at the age of 90, full of years and honors. His private character was easy and contented, but not, as has been hastily assumed, profligate. His turn of mind was devout, as is evident throughout his plays; and he evinced no taste for political or active life, although he is said to have accepted command in the Samian war. He was a prolific author. He was the reputed composer of as many as 130 plays, of which, however, 17 have been deemed spurious. He gained, according to his biographer, the first tragic prize 20 times, bearing the palm on several occasions from Æschylus and Euripides, not to mention less well-known competitors. He wrote also pæans, elegies, and epigrams, of which we have but few remains. He lived on terms of intimacy not only with his great rivals, but with Aristophanes and Herodotus. We have no knowledge of the order in which his plays, that have survived, were written. The most plausible arrangement is perhaps that of Müller, who graduates them as follows: *Antigone*, *Electra*, *Trachiniae*, *Œdipus Rex*, *Ajax*, *Philoctetes*, *Œdipus Coloneus*. Sophocles is justly accounted the most perfect of the Attic tragedians. In his hands tragedy becomes the true and faithful reflex of human feelings, passions, impulses. His ideas are ethical, with a constant reference to a divine disposer of events. "There has hardly," says Müller, "been any poet whose works can be compared with those of Sophocles for the universality and durability of their moral significance. Of all the poets of antiquity, he has penetrated most deeply into the human heart." His versification is remarkable for its softness and fluency. The best editions are those of Wunder (Gotha and Erfurt, 1831-46) and Schneidewin. The chief translations of Sophocles into English are those of Potter (Lond. 1788), Dale (Lond. 1824), and Plumptre (1865). We may also mention special translations by Prof. Thompson of the *Ajax*, by Dr. Donaldson of the *Antigone*, and by Prof. Campbell of the *Antigone* and *Electra*.

SOPHOCLES, EVANGELINUS APOSTOLIDES, LL.D., b. Greece, 1807; educated at Mt. Sinai convent and at Amherst college in the United States, whither he emigrated. He was tutor in Greek, for most of the time between 1842 and 1859 at Harvard college, where from the year 1860, he was prof. of ancient, modern, and Byzantine Greek. Among his publications are a *Greek Grammar* (1838); *Romæ Grammar* (1842); *Catalogue of Greek Verbs* (1844); *History of the Greek Alphabet* (1848); *Glossary of Later and Byzantine Greek* (1860), of which a revised edition appeared in 1870 as *Greek Lexicon of the Roman and Byzantine Periods*. He d. 1883.

SOPRANO (Ital.), the highest species of female voice, whose range extends from

to , or in some cases higher. The highest notes generally belong to the

false alto register. Sweetness and mellowness are the characteristic qualities of a soprano voice, which is for the most part less full than an alto, but lighter, fresher, and more expressive of joyful, lively, and highly impassioned feelings. A voice sometimes distinguished as intermediate between alto and soprano, is the *mezzo-soprano*, whose usual

compass is from  to .

SORA, a city of southern Italy, in the province of Caserta, with '81, 5411 inhabitants. It stands in a fertile plain, watered on one side by the Liris or Garigliano, which is spanned by two bridges at the town. The population is industrious and wealthy. There are manufactories of woolen cloth and of paper. Sora was originally a Volscian town, passed into the possession of the Samnites, and then into that of the Romans.

SORAC'TE, a mountain in ancient Etruria, in the territory of Falisci, called Monte di San Silvestro, and at present Monte di Sant' Oreste, from a village situated on its side noted for its sour wine. It is 25 m. n. of Rome, separated from the Apennines by the valley of the Tiber, and rises abruptly 2420 ft. above the adjacent plain. It had formerly on its summit a temple dedicated to Apollo, to which companies of worshippers proceeded from Rome with great solemnity. The monastery of San Silvestro, which now occupies the site of the temple, was founded by Carloman in 748.

SORAU, a t. of Prussia, in the province of Brandenburg, 60 m. s.s.e. of Frankfort-on-the-Oder. It has important bleach-field, print-works, and color-works, iron foundries, and a manufactory of porcelain. Pop. '95, 14,814. Sorau is one of the oldest towns in Prussia.

SORB. See **SERVICE**.

SORBET. A drink or beverage much used in the East, compounded of lemon-juice, water and sugar, with a flavoring of rose-water or other ingredient to improve the taste; sometimes perfumed cakes are dissolved in it which are specially prepared. The name is also given by our confectioners to a kind of ice.

SORBONNE, a celebrated academic body at Paris, which dates from the middle of the 13th c., and which, down to the French revolution, held a prominent place in all church controversies. It derives its name from its founder, Robert de Sorbon, a canon of Cambrai, born at Sorbon, in the Ardennes, in 1201. He was selected by Louis IX. as his chaplain and confessor. At this time the university of Paris was at the very height of its celebrity, and Robert de Sorbon resolved on opening in it an institution in which a society of secular priests, being provided with all the necessaries for their own maintenance, should devote themselves gratuitously to the teaching of theology. It was established with the sanction of King (afterward St.) Louis in 1252, originally for the reception of 16 scholars, four respectively from the Gaulish, Norman, Picard, and English nations, to which the German was subsequently added. Robert was himself the first head; and in 1270 drew up its constitution, which remained in force without any substantial alteration till the French revolution. It was not confined to the original poor scholars, but extended to the bachelors and doctors aggregated to the body of the Sorbonne. All these were of necessity graduates of the faculty of theology of the university of Paris, but they were only admitted to membership of the Sorbonne by the votes of that body, which formed one of the four constituent parts of the theological faculty, and after a public disputation, technically called the "Sorbonica," or "Robertina," in which the disputant was required to sustain against all antagonists, from the hour of five in the morning to that of seven in the afternoon, theses or propositions selected from the whole range of theological science. The first disputant was a Franciscan friar named Mayron, a scholar of John Duns Scotus; but he was followed by many of the greatest names in mediæval and post-reformation history. These "Sorbonne acts" form in some respects one of the most characteristic chapters in mediæval literary history. The disputants in some cases exceeded 60 in number. The foundation of Robert de Sorbon was approved in 1268 by Clement IV.; but the name of Sorbonne does not appear to have been appropriated to it till the 14th century. Robert de Sorbon also established another preparatory college for the study of the humanities and philosophy, which was called the

college of Calvi, or the little Sorbonne. In the 15th c. the Sorbonne, as being in great measure identified with the theological faculty of the Paris university, holds an important place in the history of theological controversy, and in all the contests which followed the reformation in France; there being few of the great names of the Gallican church which are not included in its academic roll. Among the munificent works of the great cardinal Richelieu, who was a pupil of the Sorbonne, was what may be described as a complete reconstruction of the buildings. The new Sorbonne comprised, in addition to the public academical hall, lodgings for the 36 doctors, which were assigned to the doctors successively in the order of seniority. The head of the Sorbonne institute was called provisor, and was elected by the members together with the archdeacon of Paris, the four deans of faculty, and some other dignitaries of the university. Besides the resident members of the Sorbonne, there were also external associates, called "Soci-Hospitalitatis," who had no share in the governmental acts of the institution. The Sorbonne continued in the enjoyment of its privileges and its revenues down to the revolution, when it shared in the common ruin of all the ecclesiastical establishments of France. At the re-organization of the university by Napoleon in 1808, the Sorbonne was re-established as the theological faculty of that body; but it failed to recover its old prestige even with the clerical body. One of the conditions of membership was an oath to maintain the celebrated four "Gallican propositions." See GALLICAN CHURCH. This condition deterred many; and although it was revoked by the proposed concordat of 1817, yet on the failure of this concordat, it still continued in force down to the revolution of 1830. In the more recent organization of the university of France, the Sorbonne has resumed its place as the representative of the faculty of theology, with seven professors and a dean of faculty. The professorships are of dogmatic theology, moral theology, sacred scriptures, canon laws, church history, Hebrew, and sacred eloquence. These professors, however, are named by the minister of public instruction; and the absence of control on the part of the bishops over their appointment and their teaching has led to the general withdrawal of clerical students from the schools. Nevertheless, the Sorbonne still possesses at least the permissive sanction of the church. But the Sorbonne is now further the seat of two other faculties of the Académie de Paris (i.e., Univ. of Paris, see UNIVERSITY), those of letters and sciences; there being 12 chairs in the former faculty, and 7 in the latter.

SORCERY. An analysis of sorcery reveals the fact that it arose in every country and every tribe, with the earliest consciousness of the human being. As soon as man awoke to the knowledge of himself, as a part of creation, and felt his power, his first desire was to interfere with the workings of nature for his own wishes and needs. Thus the sorcery of the lower races may fairly be said to have developed among them, and the evidence of its remote antiquity lies in its presence among all races. The life of sorcery is the belief in the working of spirits or souls of the dead, and this faith is the substratum of the philosophy of religion from that of the lowest savages (see ANIMISM), up to that of civilized men. In the first stages of civilization the distinction between religion and sorcery hardly appears, the functions of priest and sorcerer being so blended as to be practically the same. The native Australian of the present day, scarcely believes a man can die, even a natural death, unless by being bewitched, and diseases are induced by the sorcerer only for the purpose of extracting profit from them; hence, as their belief lies in the fact that spiritual beings affect or control the events of this world, and man's life here or hereafter, this belief naturally leads to active reverence and propitiation. Storm and thunder come through the influence of the sorcerer; shooting stars and comets are to the natives omens of disaster; the great hawk's cry in the night portends the death of a child, whose soul the bird is carrying off; but when a man's finger-joints crack, he stretches out his arm, for in that direction some one is doing him a kindness. The sorcerer can bewitch him to death by pointing at him the leg-bone of a kangaroo, or he can steal away his kidney fat in which his strength lies, or he can get a lock of his hair and roast it with fat over the fire, until its former owner pines away too. It is believed that pre-historic men were addicted to magic, as in the Swiss lake-dwellings implements of baked earth have been found supposed to be amulets and relating to Moon-worship. The absence of all bones of hares in the kitchen refuse is generally supposed to be owing to a superstitious avoidance of that animal's flesh. Thus sorcery may be reckoned as among the earliest efforts of human thought, and it is found equally disseminated throughout the Pacific islands, South America, among the Indians of North America, Africa, and Madagascar.

When the Africans came in contact with the Arabs, who had a higher civilization, but still retained their magic, they borrowed from them. As an instance, the Africans have appropriated the Arab's system of lucky and unlucky days of birth, which, with their native ferocity has caused the death of thousands of children whom they believed to have been born in an evil hour. The sorcery of Egypt and Assyria, although more cultured, and worked into more elaborate system and ritual, scarcely differed in principle from that of the most barbaric ages in the remotest times. Their formulas, many of them still remaining, were mostly of religious Magic (q.v.)—that is, they invoked the aid of deities; but these were evidently evolved from still earlier, as is shown in instances where they have relied upon old or foreign words for their power over their gods. These formulas had, and still have great influence over the minds of the superstitious rustics, and their appearance in medicine then, and for ages afterwards, is

evidence of the wisdom of the physician in not discarding the use of the supernatural charm. The Egyptian calendar of lucky and unlucky days, made from an astrological point of view, is still in use in the modern Egyptian almanac; for instance, a child born on the fifth of the month Paopi, will be killed by a bull. The world of the Babylonians was peopled with hosts of nature-spirits and demons, and they had set formulas for propitiation and expulsion. In the rites of the priests this kind of supernatural power was exercised by means of sacred texts either chanted or tied on as phylacteries. A remarkable passage occurs in Ezekiel XXI, 26, in which three methods of divination are mentioned as used by the king of Babylon as he stood at the head of two ways: "He shuffled arrows, he consulted teraphim, he looked in the liver." The five planets which they called "interpreters," they consulted to foretell the wind, or rain, or heat, comets, eclipses of the sun or moon, atmospheric changes, beneficial or otherwise to nations, kings, or common men. The twelve signs of the Zodiac originated with the Babylonians, also the association of the fixed stars with the planets and the gods in a system which the later nations of Europe and Asia have followed with superstitious veneration. Thus what may be called the higher branches of sorcery or magic descended to us from Egypt and Babylon, and although the beliefs and ceremonies of ancient Eastern nations, such as Asia Minor and India, would be interesting in this connection, yet sorcery has come to us more directly from the West, and we follow that line.

The early Greeks and Romans relied upon oracle gods or goddesses, for their influence in Magic, and erected temples specially for them; and in their rites and ceremonies may be traced much of the rude old sorcery inherited from their barbaric ancestors. There was a famous oracle of this kind near the river Acheron in Thesprotia where departing souls crossed on their way to Hades; and the shrine of Apollo at Delphi was renowned throughout the world for the wisdom of the prophecies which issued from it. They worshiped the Moon, under the name of Hecate, as the controller of night phantoms, and called upon her to shine clear while they performed their magic rituals of love and hate, scattering their lovers' bones with the barley they gave to the winds and melting him to love by melted wax. They also had their belief in bewitching and the evil-eye (q.v.), which bad influences they averted by spitting, symbolic gestures, and the use of charms and amulets. In Rome much of the magic was only Greek sorcery in a Latin guise. Cicero, himself an augur, gives us in his elaborate work *On Divination* very many omens and magical formulas adopted from the Etruscans. Probably in no other country of advanced civilization was the same amount of attention given to the utterances of oracles, in high official circles, as in old Rome. Signs of magic sanction were demanded before every public act, and divination was a religious system of consulting the gods. Egyptian and Babylonish sorcerers thronged the temples at Rome, where their magic arts were well received. The Pythagorean philosophy, although more scientific in its nature, still favored the growth of magic by mystical speculations, particularly on numbers. This delusive science had long been in use in Babylon, where the planetary *seven* and the zodiacal *twelve* were duly recognized, and good deities were indicated by whole numbers and evil demons by fractions. The Pythagoreans added the active *one* and the passive *two*, the sacred *four* of space, proceeding from the *one*, the *seven* of intelligence, the *eight* of love, and the *ten* of the universe. The doctrine of Neo-Platonism (q.v.), introduced by Plato (q.v.), soon followed, and its devotees, instead of simply speculating upon the demoniac powers of the universe, aspired to establish personal relations with them and influence them in accordance with their own wishes. The systems of theurgic magic, in which sacrifices, diagrams, invocations, talismans, were used with rule and method, as though they were really effective, became more fascinating than ever. Many of these delusions have perished or become unintelligible, but the "survivals" prove the strong hold they had upon the minds of men. After the captivity of the Jews, the theurgy which was handed down into the Middle Ages partook strongly of Jewish speculation. By them angels and demons were freely introduced; Gabriel and Raphael, Beelzebub, and Ashmodai, who was undoubtedly the great evil demon *Ashina-dava* of the Persian religion. The Jewish magician relied upon the power of divine Hebrew names, such as *shem hamphorash*, or the name of Jehovah in its true pronunciation, which Solomon and other wonder-workers used with marvelous effect. He drew powerful spells from the *Cabbala* (q.v.) of the later Jews, but in his intercourse with spirits he used Hebrew and Greek in admired confusion. One of the most curious relics of the days of sorcery is the pentagram, which was an essential feature in the magic circle, to which allusion is made in a scene in *Faust* by Goethe (q.v.). This symbol came from the Pythagoreans. It is a geometrical figure for the construction of the regular pentagon (Euclid IV. prop. 11), now familiar to every student, but which to the school of Pythagoras was so great a novelty that it was used as a sign of fellowship, and it afterwards became a magical symbol, still to be seen in use in every country from Ireland to China.

The magic of the Moslem world was in part adopted from Jewish angelology and demonology and in part from Babylonish and Greek astrology, wrought out by such men as Paul of Alexandria and Claudius Ptolemy; and the modern wizard in England would be able to fraternize with his brother sorcerer in Bagdad or Delhi, so similar are their

fumigations, incantations, horoscopes, etc. The ancient Hindu magic was mostly religious, turning on the actions of demons in causing diseases by possession (q.v.) and their exorcism (q.v.). A knowledge of the early Aryan (q.v.) rites sometimes throws great light on European practices derived from the same stock. Thus the magical practice of going round "with the sun" well known as *deasil* in Highland Scottish superstition, and remembered in England in the rule of passing the decanter "through the buttonhole," appears to be a rite of Aryan sun-worship handed down from remote antiquity, for (under the name of *pradoxina*) it seems to form part of the Hindu marriage ceremony, passed along from Vedic times. Among the Mongols, the sorcerer priests are very remarkable types of their ancient clan. They have a peculiar system of reckoning days, months, and years by a zodiac-calendar, whose signs *ape, horse, dog*, etc., are combined in series with the elements, male and female, so that a certain year may be called that of the "female fire dog," and it recalls the Egyptian zodiac. The magic of China is remarkable for its various elaborate modes of divination. The most in vogue at present may be obtained from mediums possessed by spirits who either speak or write with the "descending pencil," as has been done lately by spiritualists in America and Europe. Or they divine by sacred lots, "eight diagrams," or "wind and magic." It must not be supposed that sorcery was allowed to flourish without persecution; but the opposition did not infer any skeptical doubts as to its reality. Magic was none the less true to them for being hated and persecuted; it was only that the prophet was false, not that magic was unreal, that one particular sorcerer was pretending to supernatural power he did not possess. The Levitical law prohibited sorcery under penalty of death (Levit. XX. 27.). Among the early Christians sorcery was recognized as miracle, but against the law, and magic acts, such as turning men into beasts, calling up familiar spirits, raising storms, etc., were not alluded to in an unbelieving spirit, but with condemnation.

As Christianity gradually swept over Europe, the same antagonism continued, the church endeavoring with some success to subdue the old traditional religions, and the "survivals" of superstition. In this way gradually arose the legal persecution of witches, which was continued with so much zeal through the Middle Ages under both Catholic and Protestant churches. It is wonderful how the faith of even the educated classes in the reality of magic remained unbroken for centuries, and how its more respectable branches, such as astrology and alchemy were largely followed; but we find included in their scope much of the science of the period. When the question, whether the supposed effects of magic really took place or not, was raised, during the sixteenth and seventeenth centuries, the final fall of magic began. In our day the science of sorcery is dying out, although astrology still has its votaries, and the "spiritual communications" through mediums and "spirit writings" might still be classed under the head of necromancy. The kind of sorcery most popular to-day in Europe is known as folk-lore (q.v.), and it is full of precepts for bewitching and averting witchcraft and divining omens. Although modern thought would reject entirely the idea of magic and sorcery, it must not be forgotten that the connection between religion and sorcery has always been of the closest nature, and from the pursuit of magic arts has come some of the most valuable revelations of science. Many of the delusions of magic may be accounted for by the strong connection between the thought and the wish concerning an object, and, by constantly thinking evil about things, it is one of the chief practices of the sorcerer to try to make them happen. On the other hand, the subject of this influence knowing that he has been bewitched, suffers in reality from fear, sometimes even dying from it. Thus the strong belief in this mysterious power furnishes the basis of much of the so-called witchcraft among savages, and it is to the interest of the sorcerer to extend this influence and strengthen it in every way. In many parts of England and Scotland, country folk may yet be found who believe some neighbor has the power to "overlook" an animal or child for evil, and revenge may be taken upon that neighbor under the idea that he is a sorcerer. As late as 1618, two women were executed in Lincoln, England, for burying the glove of Lord Henry Rosse, so that, "as that glove did rot and waste, so did the liver of the said lord rot and waste." So many of these aphorisms are found in folk-lore, which is treated elsewhere, that it is not necessary to repeat them, as they only serve to carry out the idea of the analogy between thought and object. In astrology this connection is still stronger, as good or bad luck often depends upon whether a star is above or below the horizon at the time of a man's birth, and the signs of the zodiac determine whether a person is just or unjust. Analogy always precedes scientific results. Amidst all its delusions and mischiefs, magic has been a source of real knowledge, for as experience corrected its errors and formulated its theories by the more exact ones of science, much of what was regarded as magic passed into the domain of science. The delusions were left behind in the mystery of occultation, still subject to further operations in that direction. Astronomy grew up in Babylon, not through the quest of mechanical laws of the universe, but through observation of the heavens to gain a fore-knowledge of war and harvest; and Kepler himself was led to his discoveries in physical astronomy through mystic magical speculations. In alchemy we may trace the early history of chemistry, which only appeared in modern times free from its magical environments. The connection of the metals with astrology, which was one of its fundamental ideas, each

metal having its planet, may still be observed in the name of the metal "Mercury," and that of "lunar caustic" for nitrate of silver. See SUPERSTITIONS.

SORECIDÆ, a family of mammalia, of the order *carnaria*, and section *insectivora* of Cuvier. They are generally small animals, covered with soft hair; under which, on each flank, is a band of stiff closely-set bristles, and among them glands which exude a peculiar odorous fluid. The legs are short, and the feet are five-toed, and generally formed for burrowing. Some species are aquatic, and their feet webbed. The sorecidæ are all plantigrade. Most of them are nocturnal animals. They generally feed on insects and worms. A remarkable characteristic of the family is the elongated muzzle.

SOREL, city and co. seat of Richelieu co., Quebec, Canada; on Richelieu river at its mouth in lake St. Peter, and on the Montreal and Sorel railroad; 45 m. n.e. of Montreal. It is on the site of a fort built in 1665; was for many years the summer residence of the governors of Canada; and has large ship-building and manufacturing interests. Pop. '91, 6669.

SORGHUM (see DURRA). It has the same climatic limits as Indian corn, though within these limits not always producing sugar. Early spring, warm summer, and late fall, are the essential climatic conditions. Its shortest period of growth and ripening is 100 days. It undergoes change soon after being cut, and if there be much variation in temperature, fermentation begins. The cane contains from 9 to 12 per cent. of sucrose, and about one-third as much other sugars, which not only do not crystallize, but prevent about an equal weight of the sucrose from crystallizing, so that, allowing for this loss, not more than 2.37 per cent. of dry sugar is obtained, or about 46.4 lbs. per ton. The milling does not extract all the sugar, some 25 or 30 per cent. being left in the vassage. The diffusion method has been used, and by it nearly all of this residue is saved; but, on a small scale, the process is much more expensive than milling. The juice is about 89 per cent. of the weight of the cane, and 85 per cent. of it can be gotten by diffusion. S. contains two-thirds as much sucrose as the tropical sugar-cane, and attempts have been made to remove the sugars preventing the sucrose from crystallizing; lime and sulphurous acids are the agents employed, but they do not remedy the difficulty. See SUGAR.

SORMA, AGNES, (AGNES MITO VON MINOTTO), German actress, born in Breslau, May 17, 1865. She appeared first in children's roles, at the age of fourteen, at the *Stadt-theater* in Breslau. From 1880 to 1882 she played successively in Görlitz, Posen, and Weimar, when she was engaged by the management of the *Deutsche Theater* at Berlin, where she has remained ever since with the exception of the years 1890-92, during which she was connected with the *Berliner Theater*. During the season of 1896-7 Sorma visited the United States, where she made a great success in Hauptman's *Versunkene Glocke*, and as *Nora* in Ibsen's *Doll's House*.

SOROCABA, a t. of Brazil, in the province of São Paulo, on the Sorocaba river; 60 m. w. of São Paulo. Important annual fairs are held, chiefly for sale of horses and mules. Pop. est. 12,000.

SOROSIS, a women's club in New York; organized March, 1868, occasioned by the refusal to women of equal privileges with men at the Dickens dinner—Mrs. Jennie C. Croly leading in the movement. It is divided into nine working committees: art, science, music, literature, higher education, philanthropy, the drama, house and home, and working women. Its meetings are held at Delmonico's on the first and third Mondays in each month; at the first, friends of members are entertained by social exercises, in charge of two of the committees; at the second, for members only, facts relating to the advancement of women and other topics are discussed.

SORREL, *Rumex*, a genus of plants of the natural order *polygoneæ*, very closely allied to *polygonum* (q.v.) and *fagopyrum* (see BUCKWHEAT), but having the perianth divided into six segments, the three inner of which enlarge and cover the *achenium*. The genus is very naturally divided into two sections, the first of which is already noticed in the article DOCK. The name sorrel belongs only to the second, characterized by diœcious flowers, and acidity of stems and leaves. COMMON SORREL (*R. acetosa*) is a perennial found in meadows and pastures throughout the whole of Europe, and is very plentiful in Britain. Its stem is from a foot to two feet high; its leaves arrow-shaped. It is an agreeable salad, and is used in soups and sauces, and as an addition to dishes of greens. It is therefore sometimes cultivated in gardens.—FRENCH SORREL, or ROMAN SORREL (*R. scutarius*), a native of France and Italy, has broader and blunter leaves, and is more frequently cultivated than common sorrel, being considered of finer flavor. SHEEP'S SORREL (*R. acetosella*) is a very similar plant, but of much smaller size, and its roots run very much under-ground, so that it is a very troublesome weed in gardens and fields of poor dry soil, in which it is very common in all parts of Britain.—For WOOD SORREL, see OXALIDÆ. For the RED SORREL of the West Indies, see HIBISCUS.

SORREL TREE, *Lyonia arborea*, formerly *Andromeda arborea*, a tree of the natural order *ericeæ*, remarkable in that portion of the order to which it belongs for its magnitude. its near allies being generally small shrubs. It grows chiefly on the Alleghany mountains, from Virginia to Georgia, and attains a height of 50 ft., with a trunk 12 to 15 in. in diameter. The wood is of little or no use. The leaves are acid, and are sometimes used for dyeing wool black.

SORRENTO (Lat. *Surrentum*, Gr. *Syrentum*), a maritime t. in the s. of Italy, province of Naples, is situated on the s.e. side of the beautiful bay of Naples, on the promontory which separates the latter from the gulf of Salerno, about 7 m. s.w. of Castellamare. Pop. (commune) '81, 7869. It is an archiepiscopal see, and possesses a cathedral. The manufacture of silk is extensively carried on. There are still considerable remains of the walls which were erected in the middle ages, and on the landward side it is surrounded by a broad and deep ravine, the side toward the sea being protected by precipitous rocks. On the n.w. of the town is a considerable plain or table-land, called *Piano di Sorrento*, about 1000 ft. above the sea level, surrounded and protected from the cold e. winds by a range of hills; it is intersected by numerous gorges and ravines, studded with villas and farm-houses, and covered with orange groves and vineyards; all which combined render the vicinity of the city in a high degree picturesque. It is celebrated for the mildness, dryness, and general salubrity of its climate, on which account it has been much resorted to both in ancient and modern times by invalids and convalescents. Among the Romans the wine of Sorrento was held in high reputation; it had to be kept about 25 years before it arrived at maturity. S. was probably originally a Grecian colony. Of the Roman city nothing remains except some subterranean cisterns, and a few fragments and substructures dignified with pretentious names. Tasso was a native of Sorrento.

SORTES BIBLICÆ, SORTES VIRGILIANÆ, etc.—Among the ancients, a favorite kind of divination was that known as *stichomancy*, or divination by lines of poetry. The method pursued was to select a number of verses from a poet, mix them together in an urn, draw one out at random, and from its contents to infer good or evil. As Virgil was the most popular and admired of all the Latin poets, his writings, and especially the *Æneid*, became the favorite book for this purpose, and it was undoubtedly this practice that laid the basis of the great reputation as a magician Virgil enjoyed during the middle ages. The Sibylline oracles were also much used for the same purpose. The practice did not cease with the introduction of Christianity; but instead of Virgil, or, to speak more correctly, alongside of Virgil, the Bible was employed to ascertain the future. In place, however, of throwing lines into a "heathen" urn, it was customary to open the book, as it were accidentally, or to stick a pin between the leaves at hazard, and then open the book—the passage first catching the eye being regarded as pregnant with prophecy as to your future welfare. Such lots drawn from Scripture were called, in the middle ages, *Sortes Biblicæ*, just as those drawn from Virgil were called *Sortes Virgilianæ*. The custom of using (or abusing) the Bible in this grossly superstitious way still lingers in England, Scotland, and other countries, but it is now more a frolic of children than aught else. The poet Hafiz is still so used in Persia.

SORTIE, an outrush of a beleaguered garrison, equivalent to **SALLY** (see **SALLY-PORT**).

SORTILEGE. This superstition of casting lots is one of the oldest known, as it is impossible to determine its age. In ancient literature we have the heroes of Homer praying to the gods and casting lots in Agamemnon's leather cap; and there are many more recent instances in which the fate of thousands has depended upon the number of spots upon a die, or the fall of a few knuckle bones. There were many varieties of sortilege. The Thriæ lots named from the Thriæ, who nursed Apollo, foretold by counters placed in an urn, and the first drawn gave the answer. In the Viales, the bearer went for a walk, bearing the lots, and asked the first boy he met to draw for him. The Prænestine recalls the parlor spelling of to-day, in which the letters of the alphabet were shaken out on to the floor, and the words made gave the omen. Among the Mohammedans a table with a hundred squares was used, on to which, after prayer, the inquirer, with his face averted, put his finger. The letter he touched began his sentence, and every fifth letter from it was taken up to make the words. Then, of course, there were the *Sortes Virgilianæ* (*supra*), in which the book was opened at a venture, and the verse touched taken as the answer in the times of difficulty. Sometimes, like the Bible, the book was pricked for a text, sometimes a knife was slipped in between the pages. Homer was used in a similar way, and so was and is the Koran. Using the Bible as a book of fate was recommended by Nicephorus Gregoras, who suggested that the Psalter was the best book for the trial. The New Testament was, however, usually employed for the purpose. St. Augustine tells us that though he disapproved of such use of the Scriptures for deciding temporal matters, he had always recourse to it in spiritual difficulties.

SORUS. See **FERNS**.

SOSTENU'TO (Ital.), a term used in musical notation to indicate a sustained mode of execution, continuous in respect of tone.

SOTERIOLOGY. See **ATONEMENT**.

SOTHERN, EDWARD ASKEW, 1826-81; b. Liverpool. He was educated for the church, but the stage was more congenial to his tastes. In 1852 he came to the United States, and appeared at the National theatre of Boston in the character of "Dr. Pangloss." He was a stock actor in Barnum's museum, New York, till 1854, when he joined Wallack's

company. In 1858 the character of "Lord Dundreary," in Tom Taylor's comedy, *Our American Cousin*, was assigned to him. He accepted the part with great reluctance, but his drawl, lisp, and peculiar skip made the play a great success, and it ran for 140 consecutive nights. In 1861 he appeared as "Lord Dundreary" in London, and the play was performed 496 nights. In 1864 he appeared as "David Garrick;" in 1874 in the part of "Brother Sam," written for him by John Oxenford. He returned to New York in 1874, played "Dundreary" and "Garrick" at Wallack's theatre, and appeared later in the same parts in all the large cities. In 1878 he was again very popular in the character of "The Crushed Tragedian." His son, Edward Sothorn, has successfully sustained some of his father's rôles, besides appearing in other parts.

SOTTEVILLE-LES-ROUEN, a small t. of France, in the dep. of Seine-Inférieure, 1 m. s. of Rouen; manufactures cotton goods, cordage, and chemical products. Pop. '91, 15,268.

SOU, or **SOL**. See **SOLIDUS**.

SOUARI NUT. See **CARYOCAR**.

SOUBISE, BENJAMIN DE ROHAN, Seigneur de, 1583-1642; the brother of the duc de Rohan; served when young with Maurice of Nassau in Holland. In 1621 he took command of the Protestant forces in Brittany, Anjou, and Poitou. After the capture of St. Jean d'Angely he received the pardon of Louis XIII., but in 1622 was again in the field for the cause of the reformation. Again defeated, he fled to Germany and England; was again pardoned, but, after three years of inaction, seized the isle of Rhé, and after a sea fight fled a second time to England. He sailed with Buckingham and Denbigh to Rochelle, both expeditions proving failures. A third attempt was prevented by the murder of the duke of Buckingham by Felton. The rest of Soubise's life was spent in. England in intrigue against the French monarchy.

SOUBISE, CHARLES DE ROHAN, Prince de, 1715-87; b. France. He served Louis XV. as *aide-de-camp* during all the campaigns from 1744 to 1748, and in the last year was made field marshal. In 1751 he was placed at the head of the Flanders and Hainault government, but was disgracefully defeated by the Prussians at Rosbach in 1757. But he was the favorite of Mme. Pompadour, and was made state minister by Louis. In 1758 he was again placed at the head of the army and defeated the Hessians, Hanoverians, and English at Sondershausen and Sutzenberg. Soubise paid court to Dubarry, the king's new favorite, and even allowed his cousin to marry her nephew. Of all the courtiers, he alone followed the body of Louis XV. to its grave. Under Louis XVI. he retained his position as minister.

SOUDAN. See **SOODAN**.

SOUFFLÉ, a light and agreeable dish, consisting chiefly of the whites of eggs, to which other ingredients (chocolate, cheese, vanilla, orange-flower water, rose-water, various essences, etc.) are added, to give consistency, flavor, and variety. The materials have to be agitated with a whisk until the whole is in a creamy froth; which is then baked in a soufflé-pan, made of such a form as to fit into a dish or proper holder, that can be sent to table, and quickly handed round.

SOUKCHOUM KALE', a sea-port town of Asiatic Russia, in the government of Transcaucasia, on the e. coast of the Black sea. In 1831 a commercial port was established here, which, however, has surrendered its pre-eminence to Poti, a town about 70 m. to the s.e.

SOUL, in the language of spiritualistic philosophers, covers the whole region of mind, and is generally conceived of as a naturally imperishable entity, in relation with the body, but definable, for the most part, only in terms of the complete negation of material attributes. With this the popular conception in the main coincides, though it is less labored and considerably less negative. In its original signification the word appears to have stood for the principle of life both in men and in animals. The modes of conceiving it were various: it was sometimes regarded as the mere harmony of the bodily functions, and sometimes as a distinct entity of highly ethereal nature, and generally supposed to be seated in, or connected with, the blood; but no essential distinction was made between the soul of man and the soul of brutes. Very soon, however, the manifest superiority of man to the lower creation suggested difficulties, which were increased as the thought of an after-life, in a different sense from transmigration, was gradually developed. And in man, the constant war among his members, the opposition of passion and reason, as it began to be observed with the growing habit of introspection, called for some explanation which should apply to humanity only. To meet all such difficulties, a "trichotomy," or three-fold division of the human constitution was assumed, according to which a naturally immortal and rational element was supposed to make part of man, besides the animal soul (always variously conceived) which he shared with the brutes. Between the two distinct elements—the animal and the rational soul—the various mental energies were differently apportioned by different thinkers, according as those energies were thought more or less noble and divine. Without going back upon obscure traditions regarding the beliefs of the early peoples, Plato's views may be cited as amounting to a trichotomy, and in Aristotle there is the

distinct mention of a noetic principle in man by the side of the animal soul. Later Greek schools put forward a similar view; and Philo, the forerunner of the Neoplatonists, even spoke of *the soul of the soul*. Lucretius has the same curious expression, to which corresponds the distinction of Roman writers in general between *animus* and the animal soul, *anima*. The earliest Christian writings occasionally distinguish body, soul, and spirit (*pneuma*). Such a threefold division was unfamiliar to the Jewish mind, which appears to have rested in a kind of dualism, and was removed even from the common Greek philosophical expression, *pneuma* being the word employed by Stoic dualists to describe the fine ethereal nature of the material soul. It is hard to say whether a thoroughgoing trichotomy was meant by the Christian writers, or whether the soul was not merged in either of the extreme elements—the coarse material body, or (as commonly conceived) the finely attenuated but still material spirit. Till about the 4th c., the language of trichotomy prevailed in the Christian writings, but thenceforth the doctrine became suspect, having been specially appropriated by certain heretical sects, and soul and spirit came to be identified in substance, and distinguished only in function. Aquinas, and, later, Calvin, pronounced in favor of the dualistic rendering, after which modern popular expression has been molded, chiefly through the predominant influence of spiritualism since the time of Descartes. This gives prominence to the word soul over spirit, except in religious and purely metaphysical aspects. The successors of Descartes have followed him in calling the single soul at once both rational and sensitive; but in rejecting, almost without exception, his description of the lower animals as mere mechanical automata, they have ignored, without an attempt to explain, the real difficulty that he sought to get rid of, and that the trichotomy sought to meet. The ancient doctrine has been revived in various shapes by Paracelsus, Van Helmont, the anatomist Willis, De Maistre, and others.

The Egyptian doctrine of the soul is one of the most important, as it is the most ancient, for this nation appears to have been the first to declare that the soul was immortal. The genesis of the soul itself, however, is not defined by the monuments, although the existence of a cosmic soul, from which the others proceeded, is mentioned by ancient authors. The following may be gathered from a comparison of the papyri and monuments with the traditions handed down by the classical writers:—The soul itself, once separated from the cosmic or mundane soul, was supposed to undergo numerous transmigrations, passing from one animated body to another till its cycle of existence was fulfilled. The soul was considered to be essentially distinct from the body, and only connected with it through the link of life. It was represented in the hieroglyphs by several signs, as a basket of fire, a heron, a hawk with a human face, and a ram. Its nature was divine, but after death it passed to the great judgment in the hall of the two truths, where it was tried before Osiris and the forty-two assessors or demons of the dead, whose verdict determined its future destiny. This depended upon the sins it had perpetrated during life, and which more or less interfered with its transmigration through the necessary cycle of existence till its ultimate union with the deity, and reception into the Egyptian heaven. In the judgment it was accused by the enemy or accuser; and after the judgment it was either devoured or annihilated, passed to the region of the Egyptian hell, or to the place of the metempsychosis, from which it entered some body of man or animal on the point of entering into existence. The great desire of the dying, indeed was, that his soul should pass off the earth, its detention here preventing its ascent to the moon or heaven. The souls of the wicked passed into the Egyptian hades, which the sun was supposed to traverse during the hours of the night. There they were subjected to punishments of a corporeal rather than spiritual nature—burned in brasiers, plunged into streams, kept in utter darkness, and deprived of the presence of the sun-god, uttering fearful howls and wails in the prisons within which they were confined. After the passing of the great judgment the soul underwent a series of transformations and adventures in the future state. It was justified, as Osiris had been, against the accusations laid to its charge by evil spirits. It assumed the form of a hawk, heron, swallow, and of a snake with a human head—that of the cosmic soul. In the fields of the Aah-en-ru, or Ahlu, the Egyptian Elysium, it sowed and reaped the harvest of gigantic grain which grew in that happy plain. It ascended the *makken*, or mystical bark, and rowed through the winding of the celestial Nile, passed the fiery caldron of the hades, revisited the body, entered the boat of the sun, and passed through different regions of the Egyptian hell, in which the damned were detained, arriving at last at the manifestation to light. To preserve the body, in order that the soul might revisit and probably reanimate it at a future period, not only was it embalmed with the greatest care, but amulets were attached to it which were supposed to have the power of retaining the vital warmth, and of protecting it from destruction or decay. The period after which the soul was supposed to enter again into a human body was 3,000 years, during which it transmigrated through other orders of animated nature. The principal dogmas, indeed, of the soul among these people were its creation or emanation from the cosmic soul, its transmigrations, and its final reception into heaven, where it lived in the boat of the sun, and traversed the liquid ether in company with that luminary. The Pythagorean and Platonic schools seem to have drawn extensively from Egyptian sources in regard to the nature and des-

tiny of the soul. The Brahmanical and Buddhistic notions of the soul have also much in common with the Egyptian. See **BUDDHISM, TRANSMIGRATION**.—Herodot. ii. 23; Plutarch, *De Isid.* c. 29; Hermes, *Clavis*; Prichard, *Egypt. Mythol.*; Rheinisch, *Denkm. in Miramar* (Wien, 1865); Tylor's *Primitive Culture* (1871).

SOULANGES, a co. in w. Quebec, Canada; adjoining Glengarry co., Ottawa, on the w. and bounded s. by the St. Lawrence river; 138 sq. m.; pop. 91, 9608. The surface is undulating and fairly fertile; wheat, oats, rye, potatoes, and dairy products are the staples. Co. seat, Coteau Landing.

SOULE, GIDEON L., 1796–1879, b. Maine, educated at Bowdoin college. He was connected with Phillips Exeter academy for more than 50 years; was for 17 years the associate at that institution of Dr. Benjamin Abbot, its first principal, and was himself principal, 1838–73. The school under his management took a high rank among American fitting schools.

SOULE, JOSHUA, D.D., 1781–1867; b. Maine; licensed to preach in 1798; joined the Methodist conference in 1799; ordained elder in 1802; appointed presiding elder of the Maine district in 1804; chosen book agent and editor of the *Methodist Magazine* in 1816; elected bishop in 1820, but declined; stationed at New York in 1821 and at Baltimore in 1822–23; re-elected and consecrated bishop in 1824; was delegate from the general conference to the British Wesleyan conference in 1842, and afterward traveled in the British islands and France. On the division of the church he adhered to the south, resided in Nashville, Tenn., and made an episcopal tour in California, 1853–54. He was the senior bishop of the Methodist Episcopal church.

SOULÉ, PIERRE, 1802–70; b. Spain; educated at Bordeaux and Toulouse. He took part in a conspiracy against the Bourbons; edited a radical paper; was sentenced to imprisonment for articles reflecting on the ministry; escaped and settled in New Orleans in 1825. There he was admitted to the bar, and soon acquired a large practice. In 1847 he was elected to the U. S. senate to fill a vacancy; re-elected in 1849. He represented extreme southern views, and was prominent in the debates on the compromise measures of 1850. He was appointed minister to Spain in 1853. He wounded Turgot, the French ambassador, in a duel; favored the insurrection in Madrid in 1854; took part in the Ostend conference in the same year, and returned to the United States in 1855. He opposed the secession of Louisiana, was arrested in 1862 for disloyalty and imprisoned. He was released on condition of leaving the country, to which he returned shortly before his death.

SOULIÉ, MELCHIOR FRÉDÉRIC, 1800–47; b. France. He was expelled from the law school in Paris on account of his radicalism. In 1824 he published a volume of poems, *Amours Français*, and in 1828 his drama *Roméo et Juliette* was produced at the Odéon. In 1832 his play *Clotilde* was performed, and in 1836 he wrote a novel, *Diane et Louise*, which proved very successful. Among many other novels, he published *Le Maître d'Ecole*; *Si Jeunesse Savait, si Vieillesse Pouvait*; and *Mémoires du Diable*.

SOULOUQUE. See **FAUSTINUS I.**

SOULS, CURE OF (Lat. *cura animarum*, care of souls), the technical phrase by which the canon law describes the charge which is given to a pastor, no matter of what degree of dignity, over the spiritual concerns of a flock; and the words especially imply the right of administering the sacraments. In this sense the phrase is used to mark an important distinction between two classes of benefices or church livings—"benefices with," and "benefices without," the cure of souls. Of the latter class are canonries, prebends, and the whole class known in the canon law as "simple benefices." Of the former are parochial cures, vicarial cures, and still more the higher charges of archbishop, bishop, etc.

SouLT, NICOLAS-JEAN DE DIEU, Duke of Dalmatia and Marshal of France, the son of a notary, was b. at Saint-Amens-la-Bastide, in the dep. of Tarn, March 29, 1769. In 1785 he enrolled himself as a private in the royal infantry regiment, and so distinguished himself by his steady obedience to discipline, indomitable *sang-froid*, and general intelligence that, in 1792, he became adjutant-major. His behavior at Fleurus gained for him (Oct. 11, 1794) the brevet of general of brigade. From 1794 to 1799 he was employed on the eastern frontier, and in the retreat after the defeat of Stockach (March 25, 1799), his able handling of the rear-guard alone prevented the annihilation of the French army. Appointed general of division (April 21, 1799), and put under Massena, whom he ably seconded in Switzerland and Italy, he was afterward, on the warm recommendation of Massena, appointed by Napoleon to one of the four colonelships of the consular guards, and now became an ardent Napoleonist. This devotion, doubtless, was a great means of his obtaining the bâton of marshal of France; but he most certainly justified his appointment by his brilliant achievements in the subsequent campaign against the Austrians, closed by the battle of Austerlitz, which he decided by piercing the Russian center. He also did good service in the Prussian campaign, and took an important, though not a prominent, part in the Russian campaign of 1806–7,

after which he was appointed governor of Berlin and created duke of Dalmatia. Soult was next placed at the head of the second corps in Spain, pursued the retreating British, attacked them at Coruña, and though repulsed, forced them to leave all their matériel behind. He then conquered Portugal and exercised vice-regal authority over it, but the sudden arrival of Wellesley at Coimbra, and of Beresford at Chaves, made him retreat rapidly to Galicia. In Sept., 1809, he became commander-in-chief in Spain, gained a brilliant victory at Ocana (Nov. 18); and at the commencement of the following year overran and subdued Andalusia, continuing to command in person the southern army. In attempting to succor Badajoz, which he had captured and garrisoned (March 11), he was defeated by Beresford at Albuera (May 16, 1811). After the battle of Salamanca and the advance of the British on Madrid, Soult became thoroughly disgusted at the rejection of his admirable plans for transferring the theater of war to Andalusia, and demanded and obtained his recall; but on the news of Vitoria (q.v.) reaching Napoleon, Soult, whom alone he considered capable of turning the tide of ill-fortune, was, in all haste, restored to the command-in-chief of the army of Spain. Now, however, it was not in Spain, but in France, that the contest had to be waged, and the advantage of numbers, discipline, and prestige were all on the enemy's side; nevertheless, by a system of military tactics which has been universally admired, he completely neutralized the consummate strategy of Wellington, and reduced the campaign, during the seven months it lasted, to a mere trial of strength, the defeats which he sustained at Orthez and Toulouse being due to the superiority of the British soldiers, not of their general. With his usual suppleness of character he became an ardent royalist after the abdication of Napoleon; but on the return of the latter from Elba, he abandoned Louis XVIII. and became maj.gen. of the imperial army. After Waterloo he rallied the army at Laon; and on July 3, at the council of war, coincided with Carnot as to the uselessness of further resistance. To avoid the punishment due to his treachery he published a memoir traducing Napoleon in the basest manner, and lauding the "lawful princes" (i.e., the Bourbons); but in spite of this he was banished and not recalled till May, 1819; although, in the course of a few years more, he was restored to all his former honors, and took an active part in politics and in the development of French industry. In 1838 he was sent as ambassador to England, and, as the great antagonist of Wellington, was received with the utmost enthusiasm. In 1845 he retired from active duty, was honored with the appointment of "marshal general of France," and retired to his residence of Soultberg, where he died, Nov. 26, 1851. In the following year a statue of him, in white marble, was placed in the galleries of Versailles. See Soult's *Mémoires*; also, Napier's *History of the Peninsular War*; Thiers's *Histoire de la Révolution et de l'Empire*; and Salle's *Vie Politique du Maréchal Soult* (1834).

SOUND (Lat. *sonitus*) is the impression produced on the ear (q.v.) by the vibrations of the elastic medium, such as air or water, in which it is plunged. That this is the case is proved, *first*, by the fact that a bell or tuning fork *in vacuo* gives no sound when struck; *second*, by the fact that mere currents, as such (winds, running water, etc.), do not produce the sensation of sound until they are frittered down into vibratory motions by obstacles.

The most untutored ear distinguishes at once between a mere *noise* and a *musical note*. It of course distinguishes a *loud* sound from a faint one. Moreover, it distinguishes musical notes from one another by their shrillness or gravity, or, as it is technically called, their *pitch*. Again, as in the case of vowel-sounds sung to the *same* musical note, or as in the case of different instruments (flute and violin, for instance) playing the same note, it distinguishes something further—which is called the *quality* of the note. It is on the pitch of notes that the theory of music (q.v.) is based, for the quality is only of importance in giving variety, as in orchestral music—or in giving richness of tone in a solo. The most perfect *music*, so far as theory goes, may be executed on the poorest instrument, but it gives little pleasure from the want of richness or quality. In the same way a singer may possess faultless intonation, yet the performance, though *musically* perfect, may, from the harsh quality of the voice, be unpleasant. We intend in the present article to avoid everything connected with music, and have made these remarks to show that there is something in the theory of sound more profound than is contemplated in the theory of music.

The questions we have now to discuss are:

1. What constitutes the difference between a mere noise and a musical note?
2. On what does the pitch of a note depend?
3. On what does its quality depend?

The answers to these queries are all contained in the following statement:

Every musical note consists in the repetition at equal small intervals of time, of some definite noise; the pitch depends on the rate of repetition; and the quality upon the nature of the fundamental noise.

Rough experimental illustrations of the parts of this statement are easily given, more refined ones will be afterward alluded to. If, for instance, the edge of a card be held to a revolving toothed-wheel, a definite noise is produced as each tooth bends the card and allows it to spring back. While the wheel revolves slowly, we can distinguish these suc-

cessive noises; but when it is revolving so fast that they are no longer separately distinguishable, the character of the sound changes completely. It now becomes continuous, and, so far as the ear can detect, uniform, and thus becomes a musical note (with such an apparatus, not a pleasing one). As the wheel is made to revolve faster and faster, the pitch of the note rises till it becomes a sort of shriek, and finally becomes inaudible. The *sirène* (q.v.) gives another excellent illustration. In this case the fundamental noise is produced by a puff of air escaping from an orifice; and we observe, just as before, that the greater the number of such puffs per second, after they have become so frequent as to be separately undistinguishable, the higher is the pitch of the musical note produced.

Now, if by machinery we arrange matters so that the *sirène* and the toothed-wheel give the number of puffs and the number of impacts on the card the same per second, the musical note produced by each has the same pitch. But the notes differ greatly in quality, the one being exceedingly soft and pleasant, the other harsh and grating. The pitch, therefore, depends on the number of noises per second, and the quality upon the nature of the fundamental noise. We shall find a complete theoretical proof of this later.

The general nature of the mechanical process by which sound is propagated in the air will be illustrated, and compared with other cases of wave-motion, in our article on WAVE. Meanwhile, it is only necessary for us to observe that, as the velocity of sound is ten times greater than that of wind in the most violent hurricane, it is not *air* itself which is transferred from place to place, but a *state of disturbance* (condensation or rarefaction) of the air. Each successive layer of air in the path of the sound suffers this disturbance in turn, and by virtue of its elasticity (q.v.) passes it on to the next.

Newton was the first who attempted to deduce from mechanical principles the velocity of sound, but only for the particular case in which each particle of air in the path of the sound is supposed to move backward and forward according to the same law as the bob of a pendulum (q.v.). He showed that this species of motion is consistent with the elastic properties of air, as given by Boyle's or Mariotte's law (q.v.), viz., that the pressure of air is proportional to its density. The velocity of sound in this case is of course to be found from the time which elapses between the commencement of the motion of any one particle of air, and that of another at a given distance from it, in the direction in which the sound is moving. The numerical result deduced by Newton with the then received experimental data for the compressibility of air, was 979 ft. per second. This investigation was very defective, applying, in fact, solely to the special case of a pure musical note, continually propagated without lateral divergence; yet the solution obtained by Lagrange from a complete analysis of the question, gave precisely the same mathematical result.

But, by direct measurements, carefully made, by observing at night the interval which elapses between the flash and the report of a cannon at a known distance, the velocity of sound has been found to be considerably greater—in fact, about 1090 ft. per second, at the temperature of freezing water.

Newton seeks for the cause of the discrepancy between theory and observation in the idea that the size of the particles of air is finite compared with their mutual distance; and that sound is instantaneously propagated through the particles themselves. Thus, supposing the particles to have a diameter $\frac{1}{8}$ of the distance between them, we must add $\frac{1}{8}$ to the space traveled by sound in a second, i.e., to the velocity—which will thus be brought up to $(1 + \frac{1}{8})$ 979 ft. = 1088 ft. nearly, which is a very close approximation to the actual value given above.

This is not one of Newton's happiest conjectures—for, independent of the fact that such an assumption would limit definitely the amount of compression which air could undergo, and, besides, is quite inconsistent with the truth of Boyle's law for even moderate pressures, it would result from it that sound should travel slower in rarefied, and quicker in condensed air. Now, experiment shows that the velocity of sound is unaffected by the height of the barometer; and, indeed, it is easy to see that this ought to be the case. For in condensed air the pressures are increased proportionally to the increase of condensation, and the mass of a given bulk of air is increased in the same proportion. Hence, in a sound-wave in condensed air, the forces and the masses are increased proportionally, and thus the rate of motion is unaltered. But the temperature of the air *has* an effect on sound, since we know that the elastic force is increased by heat, even when the density is not diminished; and therefore the velocity of sound increases with the temperature at the rate of about $4\frac{1}{2}$ ft. per Fahr. degree, as is found by experiment.

Newton's explanation of the discrepancy between theory and experiment being thus set aside, various suggestions were made to account for it; some, among whom was Euler, imagining that the mathematical methods employed, being only approximate, involved a serious error.

The explanation was finally given by Laplace, and is simple and satisfactory. When air is *suddenly* compressed (as it is by the passage of a sound-wave), it is heated; when suddenly rarefied it is cooled, and this effect is large enough to introduce a serious modification into the mathematical investigations. The effect is in either case to *increase* the forces at work—for, when compressed, and consequently heated, the pressure is greater

than that due to the mere compression—and, when rarefied, and consequently cooled, the pressure is diminished by more than the amount due to the mere rarefaction. When this source of error is removed, the mathematical investigation gives a result as nearly agreeing with that of observation as is consistent with the unavoidable errors of all experimental data. It is to be observed that, in noticing this investigation, nothing has been said as to the pitch or quality of the sound, for these have nothing to do with the velocity. It must, however, be remarked here that, in the mathematical investigation, the compressions and rarefactions are assumed to be very small; i.e., the sound is supposed to be of moderate intensity. It does not follow, therefore, that very violent sounds have the same velocity as moderate ones, and many curious observations made during thunderstorms seem to show that such violent sounds are propagated with a greatly increased velocity. (See a paper by Earnshaw in the *Phil. Mag.* for 1861.) It is recorded that in one of Parry's arctic voyages, during gun-practice, the officer's command 'Fire' was heard at great distances across the ice after the report of the gun.

Since sound consists in a wave-propagation, we should expect to find it exhibit all the ordinary phenomena of waves (q.v.). Thus, for instance, it is *reflected* (see ECHO) according to the same law as light. It is *refracted* in passing from one medium to another of different density or elasticity. This has been proved by concentrating in a focus the feeble sound of the ticking of a watch, and rendering it audible at a considerable distance, by means of a lens of collodion films filled with carbonic acid gas.

Sounds *interfere* to re-enforce each other, or to produce silence; just as the crest of one wave in water may be superposed on the crest of another, or may apparently destroy all motion by filling up its trough. The simplest mode of showing this is to hold near the ear a vibrating tuning-fork and turn it slowly round its axis. In some positions, the sounds from the two branches re-enforce, in others they weaken, each other. But if, while the sound is almost inaudible, an obstacle be interposed between the ear and one of the branches, the sound is heard distinctly. Beats, which will shortly be alluded to, form another excellent instance.

To give an idea of the diminution of loudness or intensity of a sound at a distance from its source, let us consider a series of spherical waves diverging from a point. The *length* of a wave, as we know from the theory, does not alter as it proceeds. (Indeed, as we shall presently see, the pitch of a note depends on the length of the wave; and we know that the pitch is not altered by distance.) Hence, if we consider any one spherical wave, it will increase in radius with the velocity of sound, but its thickness will remain unaltered. The same disturbance is thus constantly transferred to masses of air greater and greater in proportion to the *surface* of the spherical wave, and therefore the amount in a given bulk (say a cubic inch) of air will be inversely proportional to this surface. But the surfaces of spheres (q.v.) are as the squares of their radii—hence the disturbance in a given mass of air, i.e., the loudness of the sound, is inversely as the square of the distance from the source. This follows at once from the law of conservation of energy (see FORCE), if we neglect the portion which is constantly being frittered down into heat by fluid friction. All sounds, even in the open air, much more rapidly in rooms, are extinguished ultimately by conversion into an equivalent of heat. Hence sounds really diminish in intensity at a greater rate than that of the inverse square of the distance; though there are cases on record in which sounds have been heard at distances of nearly 200 miles. But if, as in speaking-tubes and speaking-trumpets, sound be prevented from diverging in spherical waves, the intensity is diminished only by fluid friction, and thus the sound is audible at a much greater distance, but of course it is confined mainly to a particular direction.

As already remarked, the purest sounds are those given by a tuning-fork, which (by the laws of the vibration of elastic solids) vibrates according to the same law as a pendulum, and communicates exactly the same mode of vibration to the air. If two precisely similar tuning-forks be vibrating with equal energy beside each other, we may have either a sound of double the intensity, or anything less, to perfect silence, according to their relative *phases*. If the branches of both be at their greatest elongations simultaneously, we have a doubled intensity—if one be at its widest, and the other at its narrowest, simultaneously, we have silence, for the condensation produced by one is exactly annihilated by the rarefaction produced by the other, and *vice versa*. But if the branches of one be loaded with a little wax, so as to make its oscillations slightly slower, it will gradually fall behind the other in its motion, and we shall have in succession every grade of intensity from the double of either sound to silence. The effect will be a periodic swelling and dying away of the sound, and this period will be longer the more nearly the two forks vibrate in the same time. This phenomenon is called a *beat*, and we see at once from what precedes, that it affords an admirable criterion of a perfect *unison*, that is, of two notes whose pitch is the same. It is easy to see, by the same kind of reasoning, that if two forks have their times of vibration nearly as 1:2, 2:3, etc.—i.e., any simple numerical ratio—there will be greater intervals between the beats according as the exact ratio is more nearly arrived at.

We must now consider, so far as can be done by elementary reasoning, the various simple modes of vibration of a stretched string, such as the cord of a violin. Holding one end of a rope in the hand, the other being fixed to a wall, it is easy (after a little

practice) to throw it into any of the following forms, the whole preserving its shape but rotating round the horizontal line. If the tension of the rope be the same in all these cases, the times of rotation must be inversely as the number of equal segments into which the rope is divided; for the various parts will obviously have the same form; and the masses and distances from the axis of rotation being proportional to their lengths, the centrifugal forces (see CENTRAL FORCES) will be as the squares of the lengths, and inversely as the squares of the times of rotation. But these centrifugal forces are balanced by the components of the tensions at the extremities, in directions perpendicular to the horizontal line; which are, by hypothesis, the same for all the figures. Hence the time of rotation is directly as the length of each segment.

Fig. 1.

Fig. 2.

Fig. 3.

Fig. 4.

Fig. 5.

Now (see PENDULUM) any such rotation is equivalent to two mutually perpendicular and independent pendulum vibrations of the cord from side to side of the horizontal line. Thus, a violin string may vibrate, according to the pendulum law, in one plane, either as a *whole* (fig. 1), as *two halves* (fig. 2), as *three thirds* (fig. 3), etc.; and the times of vibration are respectively as $1, \frac{1}{2}, \frac{1}{3}, \dots$ Nay, more, any two or more of these may coexist in the same string, and thus, by different modes of bowing, we may obtain very different combinations of simple sounds: a *simple sound* being defined as that produced by a single pendulum motion, such as that of a tuning-fork, or one of the uncomplicated modes of vibration of a string.

The various simple sounds which can be obtained from a string are called *harmonics* of the fundamental note; the latter being the sound given by the string when vibrating as a whole (fig. 1). For each vibration of the fundamental note, the harmonics have two, three, four, &c. Of these, the first is the octave of the fundamental note; the second the twelfth, or the fifth of the octave; the third the double octave; and so on. Thus, if we have a string whose fundamental note is C, the series of simple sounds it is capable of yielding is:

C, C₁, G₁, C₂, E₂, G₂ (B₇), C₃, D₃, E₃, &c.

Of those written, all belong to the ordinary musical scale except the seventh, which is too flat to be used in music. This slight remark shows us at once how purely artificial is the theory of music, founded as it is, not upon a physical, but on a sensuous basis.

To produce any one of these harmonics with ease from a violin string, we have only to touch it lightly at $\frac{1}{2}, \frac{1}{3}, \frac{1}{4}$, &c. of its length from either end and bow as usual. This process is often employed by musicians, and gives a very curious and pleasing effect with the violoncello or the double-bass. The effect of the finger is to reduce to rest the point of the string touched; and thus to make it a point of no vibration, or, as it is technically called, a *node*.

In the case of a pianoforte wire, a blow is given near one end, producing a displacement which runs back and forward along the wire in the time in which the wire would vibrate as a whole. The successive impacts of this wave on the ends of the wire (which are screwed to the sounding-board), are the principal cause of the sound. But more of this case later.

The theory of other musical instruments is quite as simple. Thus, in a flute, or unstopped organ-pipe, the sound is produced by a current of air passing across an orifice at the closed end. This produces a wave which runs along the tube, is reflected at the open end, runs back, and partially intercepts the stream of air for an instant, and so on. Thus the stream of air is intercepted at regular intervals of time, and we have the same result as in the *sirène* (q. v.). In this case, there is *one* node only, viz., at the middle of the pipe. If we blow more sharply, we create two nodes, each distant from an end by $\frac{1}{4}$ of the length of the tube. The interruptions are now twice as frequent, and we have the first harmonic of the fundamental note. And so on, the series of harmonics being the same as for a string. We may easily pass from this to the case of an organ-pipe closed at the upper end. For if, while the open pipe is sounding its fundamental note, a diaphragm be placed at the node, it will not interfere with the motion, *since the air is at rest at a node*. That is, the fundamental note of a closed pipe is the same as that of an open pipe of double the length. By examining the other cases in the same way, we find that the numbers of vibrations in the various notes of a closed pipe are in the proportions 1:3:5:7:&c., the even harmonics being wholly absent.

There is another kind of organ pipe, called a reed pipe, in which a stream of air sets a little spring in vibration so as to open and close, alternately, an opening in the pipe. If the spring naturally vibrates in the time corresponding to any harmonic of the pipe,

that note comes out with singular distinctness from the combination—just as the sound of a tuning-fork is strongly re-enforced by holding it over the mouth-hole of a flute which is fingered for the note of the fork. If the spring and the tube have no vibration in common, the noise produced is intolerably discordant. The oboe, bassoon, and clarinet are mere modifications of the reed-pipe; and so are horns in general, but in them the reed is supplied by the lip of the performer. Thus, a cornet, a trumpet, or a French horn, gives precisely the same series of harmonics as an open pipe.

The statements just made as to the position of the nodes in a vibrating column of air are not strictly accurate, for the note is always found to be somewhat *lower* than that which is calculated from the length of the tube and the velocity of sound. Hopkins showed experimentally that the distance between two nodes is always *greater* than twice the distance from the open end to the nearest node. The mathematical difficulties involved in a complete investigation of the problem were first overcome by Helmholtz in 1859, in an admirable paper published in *Crelle's Journal*. The results are found to be in satisfactory accordance with those previously derived from experiment.

We have now to consider the subject of the quality of musical sounds; and one of its most important branches, what constitutes the distinction between the various vowel-sounds. It had long been recognized that the only possible cause of this distinction between sounds *musically identical* must lie in the nature of the fundamental noise, or, to express it differently, the nature of the periodic motion of each particle of air. But it appears that Helmholtz was the first to enter upon a complete examination of the point, both mathematically and experimentally, and the results he has arrived at form by no means the least remarkable of the contents of his excellent work, *Die Lehre von den Tonempfindungen*, recently published.

It was established by Fourier that any periodic expression whatever may be resolved into the sum of a number of simple harmonic terms, whose periods are, respectively, that of the original expression, its half, its third part, etc. Hence any periodic motion of air (i.e., any musical sound) may be resolved into a series of simple pendulum vibrations (i.e., pure musical sounds, such as those of tuning-forks), the first vibrating once in the given period, the second twice, and so on. These notes are, as we have seen, the several harmonics of the lowest. Hence the quality of a musical sound depends upon the number and loudness of the harmonics by which it is accompanied.

Two experimental methods were employed by Helmholtz, one analytical, the other synthetical. In the first he made use of resonance-cavities fitted to the ear, and giving scarcely any indication of external sounds until one is produced which exactly corresponds in pitch with the note which the cavity itself would yield. With a series of such cavities, tuned to the several harmonics of some definite note, the note was examined when played on various instruments, and when sung to different vowel-sounds. It was thus ascertained which harmonics were in each case present, and to what extent, producing the particular quality of the sound analyzed. The second method was founded on the fact, already noticed, that a tuning-fork gives an almost pure musical sound (i.e., free from harmonics). A series of tuning-forks, giving a note and its harmonics, were so arranged as to be kept constantly in vibration by an electro-magnetic apparatus. Opposite to each was fixed a resonance-cavity exactly tuned to it, and capable of being opened more or less at pleasure. When all the cavities were shut, the sound was scarcely audible; so that by opening them in various ways, any combination of harmonics might be made to accompany the fundamental note. These combinations were varied by trial, until the quality of the resultant sound was brought to represent as nearly as possible that of some vowel. The results of this second series of experiments coincided with those of the first. It appears from these investigations that the German U is the quality of a simple sound, though it is improved by adding faintly the two lowest harmonics; that O depends mainly on the presence of the third harmonic; and so on with the other sounds. It also appears, and it is well known by experience, that different vowel-sounds, to be sung with accuracy, require to be sung to different notes, the proper note being that for which the cavity of the mouth is adapted for the production of the accompanying harmonics which determine the quality of the particular vowel.

In strings and pipes, as we have seen, the higher notes are strictly harmonics of the fundamental note, and therefore the sounds of instruments which depend on these simple elements are peculiarly adapted for music. On the other hand, when, as in masses of metal, etc., the higher notes are not harmonics of the fundamental note, the mixed sound is always more or less jarring and discordant. Such is the case with bells, trumpets, cymbals, triangles, etc.; and, in fact, these sounds are commonly characterized as "metallic." To produce from such instruments a sound as pleasing as possible, they must be so struck that as few as possible of the higher notes are produced, and these as feebly as possible. Thus, for instance, to get the most pleasing sound from a piano-forte wire, it should not be struck at the middle, as in such a case the first, third, fifth, etc., harmonics of the fundamental note will be wanting. If, however, it be struck at about $\frac{1}{4}$ of its length from one end, the harmonics produced will be mainly the first five; and these all belong to the chord of the fundamental note. A valuable recent work is Lord Rayleigh's *Theory of Sound* (2 vols. 1878).

SOUND (A.S. and Ger. *swund*; according to Grimm, for *swund*, from the root of *swim*), a word signifying generally a strait or narrow sea-way, but applied specially to the

strait which leads from the Cattegat into the Baltic sea, between Sweden on the e. and the Danish island of Seeland on the west. It forms the usual passage from the n. to the Baltic Sea, is 40 m. long, and nearly 3 m. broad at its narrowest part, between the towns of Helsingborg and Elsinore. Its entrance is defended by the strong castle and fortress of Kronborg. See **EL SINORE**.

SOUND DUTIES, certain dues formerly payable to the Danish government by all vessels passing the sound or strait separating Sweden from Seeland. These duties originated in an agreement between the king of Denmark and the Hanse Towns in 1348, by which the former undertook to maintain the light-houses in the Cattegat, and the latter to pay duty for them. England became bound to pay duty by a treaty of date 1450, and other countries followed. The Sound duties were abolished on Mar. 14, 1857, by a treaty between Denmark and other powers. A pecuniary compensation of \$16,930,640 (the share contributed by Great Britain being \$5,625,030) was stipulated to be paid to Denmark, which was to be held bound to maintain the light-houses and superintend the pilotage of the sound.

SOUNDING is the act of ascertaining the depth of the water. This is done either for purposes of navigation in piloting a ship among shoals or rocks, for ascertaining her position where the depth and nature of the bottom is previously known, or constructing a chart, etc. It is generally effected by means of a marked line, to which is attached a tapered lead, the bottom or foot of the lead being hollowed to receive some grease or tallow to which a portion of the soil at the bottom of the sea will adhere. Other methods have been devised for ascertaining depth, such as by a rotating fan-wheel, etc., but the first method is that still most generally used for ordinary depths.

SOUNDING, DEEP SEA. Until within a few years past, the term *deep sounding* was understood to be that in which a ship sounded to ascertain her position, and where the depth exceeded that which could be obtained with the lead thrown by the hand, or hand-lead; but the necessities of telegraphic communication across the ocean, by means of cables containing insulated wires, have caused the ocean to be measured at depths which were never before considered necessary, or even practicable.

The act of obtaining a deep-sea sounding may be said to consist of two parts—1. To get the sinkers to the bottom as quickly as possible with the line straight up and down; and 2. To bring a portion of the soil of the bottom, as a proof, to the surface; this necessitates the use of a small but strong line, with heavy sinkers and a detaching apparatus for freeing the sinkers when they reach the bottom, as from the smallness of the line and the great friction of all passing through the water, the strain of bringing the sinkers up would be too great for its strength. It may be stated that there is no difficulty whatever in obtaining a sounding, and regaining the sinker with bottom specimen, up to a depth of 1000 to 1200 fathoms ($1\frac{1}{2}$ m.), by means of a heavy lead fitted with a valved tube (fig. 1); but when the depth exceeds 2000 fathoms the difficulties in obtaining a correct sounding increase in a compound ratio with the depth.

The question of ascertaining the depth of water at sea has been greatly simplified from the old-time methods of lead and line where all hands of the watch on deck were required to be present. The introduction of wire in place of the rope and of self-recording leads have enabled the navigator to find out the depth of water without stopping the speed of his vessel and with the aid of but two or three men. Sir William Thomson has done more than any other one man to bring about the improved state of affairs, and his improved sounding apparatus is the one here given. The wire is coiled on a V-shaped ring which can revolve either with the spindle or independently of it, as may be desired, and when not in use it is kept in a zinc-lined box filled with lime water. When ready for use the frame carrying the coil of wire is clamped in position on top of the zinc-lined box and a brake is applied to govern the speed of the wire as it runs out. When the brake has been put on and the egress of the wire stopped a catch is moved which admits of the free revolving of the drum as it is turned by the handle. To the outer end of the wire a sinker is attached, to the cover of which the *Depth Recorder* is secured by a chain two feet long. When a cast is to be taken the recorder is put inside the sinker and is supported by the pressure of the side springs against the inside of the sinker; the slack chain is put in on top of the recorder. The object of the side springs is to prevent the shock, which the sinker experiences when it strikes the bottom, from affecting the reading of the recorder. When the sinker strikes the bottom, the depth recorder slips down the inside of the sinker and is thus relieved of the sudden shock. As the sinker descends, the increased pressure forces the piston D up into the tube, while the spiral spring pulls the piston back. The amount that the piston is forced up against

the action of the spiral spring depends on the depth. To record the depth the marker *C* is used. As the recorder goes down the marker is pushed along the piston. When the recorder is brought up to the surface of the water the piston comes back to its original position, but the marker remains at its place on the scale to which it was pushed, and shows the depth to which the recorder has been. The depth is read off by the cross wire of the marker. Between each cast the nut *A* should be unscrewed to slacken the valve *B*, and the Recorder should be emptied and the nut screwed up firmly. It takes from a few seconds to a minute for the sinker to reach the bottom from the time it is let go, and from a quarter of a minute to 4 minutes for two men to reel it in if the depth is from 10 fathoms to 100 fathoms. However perfectly free from rust the wire be kept, it will break at a kink under a very moderate pull. Without a kink and preserved from rust with proper care, the wire can scarcely be broken in practice with the machine. The former patterns of this machine had chemical tubes made of glass to be used in ascertaining the depth instead of the depth recorder; a discoloration of the chemical substance measured on a gauge gave the depth.

Many very deep soundings are on record, but the two deepest well-authenticated soundings are among those obtained by *H.M.S. Challenger*. The first was about 80 m. to the northward of the Virgin islands, the depth being 3,875 fathoms, or nearly 4½ miles. Unfortunately, not thinking that so near the islands so great a depth would be found, only 3 cwts. of sinkers were used (the usual quantity for such extreme depths being 4 cwts.); this weight, with a one-inch line, took an hour and twelve minutes to reach the bottom. As the ascertainment of the sinkers reaching the bottom depends on the time intervals, it may be stated that the line let free to run with this weight would take about 43 seconds running out the first 100 fathoms, and the time increases as nearly as possible three seconds for each successive 100 fathoms; so that when the interval is prolonged beyond this rate, the sinker has reached the bottom. On this occasion the last 50 fathoms ran out at the rate of 2 minutes 36 seconds per 100 fathoms. The other was to the n. of New Guinea, where the depth was 4,475 fathoms, or more than 5 miles.

An idea of the average depth of the n. Atlantic ocean may be had from the fact that of 108 soundings obtained by the *Challenger*, 48 were between 1000 and 2,000 fathoms, 56 between 2000 and 3000, while only the other 4 exceeded 3000. See *CHALLENGER EXPEDITION*; *DREDGE*.

SOUND NECK. A village of Pasquotank co., North Carolina, some sixty miles from Norfolk, Va.

SOUND, RECORDING OF. The best-known instrument for producing graphic representations of sound vibrations, and one which has been of great value in the study and analysis of complex sounds, such as speech, is the phonautograph. Scott's phonautograph consists of a revolving cylinder, the surface of which is made capable of receiving tracings from a very weak and delicate stylus by being smoked with a candle.

A fine point or stylus, sometimes a hog's bristle, attached to a piece of bladder stretched across the neck of a funnel, is adjusted so as to rest lightly against the revolving cylinder and scratch a fine line in the layer of smoke as the cylinder revolves. The funnel and bladder are also so placed that every motion imparted to the bristle by sound waves entering the funnel and agitating the membrane is sideways with respect to the straight line traced on the cylinder when the bristle is motionless. In this way the tracing is made irregular with every sound, the line being undulatory and having waves corresponding to and correctly representing every wave composing the sound to be examined.

SOUND, REFRACTION OF. Sound moves in straight lines, in spherical-fronted waves; and any small beam thereof, if unequally retarded or accelerated on either side, bends toward the side of retardation so that the acoustic impulses, always directly radial from the face of the sound wave, vary in their point of available impact, as the "air mirror" of sound turns distorted by disturbance. 1. Sound passing from air into water, or water into air, provides the only example really available, of acoustic refraction by difference of elasticity. Sound, encountering a strong opposition in the density of fluids, and a still greater in solids, yet avails itself of the enormously disproportioned intensity of resilience or elasticity. The waves of sound arising from an explosion under water are conveyed by the water long distances; but when cast off into the air above the explosion, the few and retarded vibrations diverge so enormously at such a height, by reason of the flat reflector of the water at the surface, and the hollow arc of force beneath generated by the explosion, as to become nearly inaudible, with their low velocity. Guns at sea, fired on a horizontal with an energy far stronger than the inertia of the air, reverse this; and with sound waves compressed between the force of the cannon and reflection from the water, transmit their force to a great distance. 2. The refraction of sound through differences of *density* has been shown by a convex lens of carbonic acid inclosed in a collodion film, transferring the ticking of a watch to a focus, where it was heard only on the interposition of the lens. The wave front received a concave form on its entrance, accelerated on its exit at the rim, its lagging center became more concave, the normals converging to a focus, 3. Prof. Stokes in 1857 first suggested the refraction of

sound by varying velocities of *wind*. Of two winds at different levels, the upper, if the faster, will retard an opposing sound wave most, and so elevate the sound focus; if the sound advanced with the wind, the focus would lower, on account of the "drag" of the lower layers. Prof. Henry, in 1865, ignorant of the theory, confirmed the above points, observing the audibility of a sound signal against the wind, heard at a ship's mast-head, and that the cloud shadows exceeded the ground wind in speed. 4. Prof. Reynolds, 1874, showed first the refraction of sound from difference of *temperature*. Since the difference in velocity of sound per second is 1 ft. to 1° Fahr., so when the lower air is warm, the sound beams are tilted up by increased speed below, and when cold, the upper strata bend over and depress the focus; in either case favoring audibility at a distance. Thus is explained the ease of extended hearing in Arctic regions.

SOUP (A.-S. *sup-an*, to sip or sup) is a well-known form of food, obtained either from flesh and vegetables, or from vegetables alone. Before noticing the most important varieties of soup, it is expedient that we should have a clear idea of what soup really is, or, in other words, what relation soup bears to the solid ingredients which enter into its composition. The researches of Liebig have thrown much light upon this point. When finely chopped muscular flesh (or butcher-meat) is lixiviated with cold water, and exposed to pressure, there is left a white fibrous residue consisting of muscular fibers, of connective or areolar tissue, and of vessels and nerves. This lixiviated flesh is of precisely the same quality from whatever animal it is obtained, communicates no flavor to water in which it is boiled, cannot be masticated, and as Liebig observes, "even dogs reject it." When the cold water has taken up all that it is capable of extracting, it is found that it has dissolved from 16 to 24 per cent of the dry chopped flesh. This watery infusion contains all the savory and much of the nutrient matter of the flesh, and is usually of a reddish tint, from the presence of a little of the coloring matter of the blood. On gradually heating it to the boiling-point, it is observed that the albumen of the flesh (varying in amount from 2 to 14 per cent, according as the animal was old or young) separates in nearly colorless flakes when the temperature has risen to 133°, while the coloring-matter of the blood does not coagulate till the temperature rises to 158°. The liquid is now clear, and of a pale yellowish tint; and as it reddens litmus-paper, it must contain a free acid. The infusion of flesh thus prepared has the aromatic taste and all the properties of a soup made by boiling the flesh. When evaporated it becomes dark-colored, and finally brown; and on ceasing to lose weight, there is obtained a brown, somewhat soft mass of "extract of flesh," or "portable soup," amounting to about 12 per cent of the weight of the original flesh, supposed to be dried. "This extract," says Liebig, "is easily soluble in cold water, and when dissolved in about 32 parts of hot water, with the addition of some salt, gives to this water the taste and all the peculiar properties of an excellent soup. The intensity of the flavor of the dry extract of flesh is very great; none of the means employed in the kitchen is comparable to it in point of flavoring power." The soup thus made of the flesh of different animals (as, for example, the ox and the fowl) possesses, along with the general flavor common to all soups, a peculiar taste, which distinctly recalls the smell or taste of the roasted flesh of the animal employed. In order to obtain the strongest and best-flavored soup, chopped flesh should be slowly heated to boiling with an equal weight of water; the boiling should only be continued for a few minutes (for prolonged boiling only gives rise to the formation of gelatine, a substance of no nutrient value, from the connective tissue of the flesh), and the soup should be then strained off from the solid residue. As a matter of economy, it is often desirable that the meat should be left in an eatable state, which is not the case with soup made according to the preceding directions. To attain this end, the joint or mass of flesh should be set on the fire with cold water, which should be gently heated to boiling; the flesh thus undergoes a loss of soluble and savory matter, while the soup becomes richer in them. The thinner the piece of flesh is, the greater is the loss which it experiences. Hence the method of boiling which yields the best soup, gives the dryest, toughest, and most tasteless meat. "The juice of flesh," says Liebig, "contains the food of the muscles; the muscular system is the source of all the manifestations of force in the animal body; and in this sense we may regard the juice of flesh as the proximate condition of the production of force. Soup is the medicine of the convalescent, and as a means of restoring the exhausted strength, it cannot be replaced by any article of the pharmacopœia. Its vivifying and restoring action on the appetite, on the digestive organs, the color, and the general appearances of the sick, is most striking."

Most soups contain an admixture of meat and vegetables in their preparation; but many good soups can be made either entirely without the use of flesh, or with fish in place of flesh. In the former class may be placed pea-soup (which is, however, much improved if a piece of bacon enters into its composition), green-pea soup, carrot-soup, potato-soup, asparagus-soup: while for fish-soup, pike, tench, and eels are specially used. See **Bisque**.

SOUR-SOP, *Anona muricata*, a small tree of the West Indies, which bears a white, pulpy, succulent fruit, similar to the custard-apple, slightly acid in taste, weighing from 2 to 3 lbs., and much relished by the people of the West Indies.

SOUTANE (Ital. *sottana*, Fr. *soutane*, Lat. *talaris*, i.e., *vestis*, "a garment reaching to the ankles"), the name usually given in France and Italy to the outer garment worn in civil life (commonly with a flowing over-dress or robe) by Roman Catholic ecclesiastics, when the strict law of clerical costume is in force; and also ordered to be worn under the priestly robes used in the public ministerial offices of the clergyman. In England it was called cassoock. It is not peculiar to bishops, priests, or even to clerics in holy orders, but may be worn by all who have received even the tonsure (q.v.). Indeed, the council of Trent (*Dic. de Reform.*, sess. 23, c. vi.) declares that no cleric shall be held entitled to the "privilege of clerics" unless he shall wear the soutane. The ordinary material of the soutane is serge or woolen cloth; but it is often of more precious stuffs. The color for the secular clergy is commonly black; but dignitaries wear other colors. Thus, the pope wears a white—cardinals, a red—bishops, a violet—many canons, a blue soutane; and in religious orders and collegiate bodies the color is regulated by special laws, which need not be particularized. Its use, as obligatory, was very general in former times, but it has gradually fallen off since the French revolution. It is but little worn in Germany, even in the southern provinces; and in Italy, except in the former papal states, it is much less universal than it was 30 years since. In all places, however, it is strictly required to be worn under the sacred vestments by a priest administering the sacraments, or otherwise officiating publicly.

SOUTH, ROBERT, D.D., the son of a London merchant, was b. at Hackney in 1633. His earlier education he received at Westminster school, of which Dr. Busby was then master; and in 1651 he became a student at Christ Church, Oxford. In 1655 and 1657 successively he took his degrees of bachelor and master of arts; he was ordained in 1658; and in 1660 he was appointed university orator. In this function he was fortunate enough to please the lord chancellor Clarendon on his installation as chancellor of Oxford, and, in reward of his complimentary periods, South was made his domestic chaplain. In 1663 he took his degree as doctor of divinity; the same year saw him promoted to a prebendary stall at Westminster; and in 1670 he became a canon of Christ Church, Oxford. In 1677 Laurence Hyde, son of the chancellor, being sent to Poland as ambassador, he was accompanied thither by South, who had been his tutor, and was the object of his warm regard. Shortly after his return, the rectory of Islip, in Oxfordshire, was conferred upon him, and he was made chaplain-in-ordinary to Charles II. He might readily now have become a bishop, but through this and the succeeding reign he steadily continued to decline the offers of higher preferment pressed upon him. The designs of James II., tending to a Roman Catholic revival, he regarded with deep disapproval and alarm; but so strong was his sense of the duty of submission to the reigning monarch that he declined all share in the conspiracy to oust him in favor of the prince and princess of Orange. When, however, the revolution was accomplished, he gave in his adhesion to it. But, to his honor, he refused to profit in the way of preferment, by the deprivation of such of the higher dignitaries of the church as could not conscientiously go along with him in recognition of the new order of things. A staunch and even bigoted adherent of the church of England, he continued to wage unsparing war from the pulpit, and with his pen, against Puritanism and every other form of dissent, occasionally occupying himself with discussions more strictly theological, till in July, 1716, death came to conclude his controversies. He is now chiefly remembered by his sermons; they are masterpieces of vigorous sense and sound English, and abound in lively and witty turns, not always in severely decorous consonance with the seriousness of the subject-matter. As a man, South seems to have been of sound and estimable character; of pure life and unblemished integrity. His entire works were sent from the Clarendon press in 7 vols. (1823), 5 vols. (1843). An edition in 2 vols. appeared in London in 1850.

SOUTH AFRICAN REPUBLIC. See TRANSVAAL.

SOUTH AMERICA. See AMERICA.

SOUTHAMPTON, a co. in s.e. Virginia, bordering on North Carolina, and bounded on the e. by Blackwater river, and s.w. by the Meherrin river; crossed by the Seaboard Air line and the Norfolk and Western railroads; drained by Nottaway river; 567 sq. m.; pop. '90, 20,078. The surface is mostly level, and partly covered with forests of cypress and pine, the latter yielding large quantities of tar and turpentine; the soil is sandy. The principal products are wool, corn, oats, and sweet-potatoes; cattle, sheep, and swine are raised. Co. seat, Courtland.

SOUTHAMPTON, a municipal and parliamentary borough, important sea-port, and county of itself, in the s. of Hampshire, 79 m. s.w. of London by the London and South-western railway. It occupies a peninsula at the head of Southampton Water, and between the estuary of the Test or Anton on the w. and s., and the mouth of the Itchen on the east. The High street, which is the principal thoroughfare, extends from the water-side to the Bargate, and thence to the outskirts of the town. Crossing the High street at right angles are many important streets, and handsome lines of new houses are found in the northern and western suburbs. Southampton is furnished with the usual municipal and other institutions common to all thriving towns. St. Michael's church, the oldest in the borough, contains Norman tower arches, and several of the private houses are of Norman architecture. The *Domus Dei*, or God's house, dates from the end of the 12th c., and is one of the earliest hospitals in England. The docks can float the largest steamers and Southampton owes its importance to its sheltered harbor and to the

phenomenon of double tides, which prolong high water for two hours. It is the place of departure and arrival of the West India and Brazil, the Mediterranean, East Indian, China, and Australian, and the South African mail steam-packets. There is considerable traffic between Southampton and the Channel islands and French coast, and also a large cattle-trade with Spain and Portugal. Its harbor is perhaps the most motley and picturesque in England, being frequently crowded with Lascars, Creoles, Arabs, etc., and, on the arrival of mail-steamers, with Indian and American planters, East Indian nabobs, foreign dignitaries, naval officers, and other British and foreign officials in every variety of costume. Its docks, which have recently been greatly extended and improved, include five large dry docks, two tidal basins (16 and 18 acres in area), and a closed dock, and can float the largest steamers. Yacht and ship building and engine-making are actively carried on, and there is an extensive general trade. Southampton is also a fashionable resort in summer. It returns two members to the house of commons. Pop. '81, 60,235; '91, 65,325.

Southampton supplanted the ancient *Clausentum*, which stood one m. to the n.e., and its foundation is ascribed to the Anglo-Saxons. It is called Hamtune and Suth-Hamtun in the Saxon Chronicle. After the conquest Southampton, from which there was ready transit to Normandy, began to prosper rapidly, and in early times it traded with Venice and Bayonne, Bordeaux and Rochelle, Cordova and Tunis. A great part of it was burned by the combined French, Spanish, and Genoese fleets in 1338, and in the following year its defenses were strengthened. Southampton is the birthplace of Isaac Watts (to whom a monument has been erected in the West park), of Thomas Dibdin and of Sir John E. Millais.

SOUTHAMPTON, HENRY WRIOTHESLEY, 3d earl of, 1573-1624; b. England; a friend of the earl of Essex, with whom he went in the expedition to Cadiz and afterward to Ireland. He was convicted, though he strenuously asserted his innocence, of complicity in the treasons of Essex, attainted, and condemned to death; but Elizabeth stayed the latter penalty, and the former was reversed by parliament early in the reign of James I. He was active in the colonization of America, and was governor of the Virginia company. He was imprisoned in the tower in 1621 for his opposition to the arbitrary measures of Charles I.; after his release he commanded a regiment in aid of the Dutch against the Spanish, and both he and his son died of a fever contracted in the Netherlands. He is best remembered as the patron to whom Shakespeare dedicated *Venus and Adonis* and *The Rape of Lucrece*.

SOUTHAMPTON WATER, a fine inlet, stretching n.w. from the point at which the Solent and Spithead unite. It is 11 m. long and about 2 m. wide. The isle of Wight, which intervenes between the Southampton Water and the channel, forms a magnificent natural breakwater, and occasions a second high-water two hours after the first. Southampton Water receives the Test or Anton, Itchen, and Hamble.

SOUTHARD, SAMUEL LEWIS, LL.D., 1787-1842; b. N. J.; educated at the college of New Jersey, and called to the bar. He was appointed associate justice of the New Jersey supreme court in 1815; elected U. S. senator, 1821; appointed secretary of the navy, 1823; was for short periods acting secretary of the treasury and of war; attorney-general of New Jersey in 1829; and governor, 1832. He was again a member of the U. S. senate from 1832 to his death, and president of that body in 1841.

SOUTH AUSTRALIA. Recent legislation has rendered this name a misnomer by extending the boundaries of the colony so as to include the entire center of the Australian continent comprised between the Southern and the Indian oceans, and between the 129th and the 141st degrees of e. long.—an area of 903,690 sq. miles.

Character of the Soil, etc.—The northern portion of this vast territory enjoys an abundant rainfall, and is watered by numerous streams and rivers, some of them, as the Victoria and the Adelaide, navigable for a considerable distance by ships of burden. The soil is fertile, and suitable for the cultivation of tropical productions of every description. In connection with the construction of the overland telegraph across the center of the Australian continent, this region has become better known as being suitable for settlement, already commenced.

The great central region opened up by the explorations of Stuart and McKinlay, and the country to the n. of lat. 33°, may be described as suited only for pastoral purposes on account of the irregularity of the rainfall and the scarcity of permanent water; and with the exception of a few patches along the coast the same description will apply to the country to the westward of gulf St. Vincent, in 138° e. long. The south-eastern division of the colony, comprised between lat. 33° and the Southern ocean, and between gulf St. Vincent and the eastern boundary of the colony, includes every variety of soil, ranging from absolute sterility to the highest degree of fertility, great portion of it being probably unsurpassed by any region in its adaptability both in soil and climate for the growth of wheat, the vine, and the olive. This region is moderately timbered, the principal varieties being the gum, the stringy bark, and the pine, all extremely useful for fencing and building purposes.

Climate.—A country extending over 27° of latitude must necessarily embrace great varieties of temperature; but the climate, owing to prevailing aridity, appears to be, upon the whole, healthy and remarkably free from epidemic diseases. The average annual mortality during 10 years has been found, in the settled districts, to be 15 per 1000 as compared with 22 per 1000 in England. Nearly half of the deaths are those of

children. The hottest months are December, January, February, and March. During these months hot winds occasionally blow. But the same dryness of the air which accounts for the great exaltation of the temperature, renders it more endurable than might at first be supposed, and Europeans are able in the hottest weather to carry on harvest-labor without danger.

Physical Aspect.—The surface of the country alternates between open plains and wooded ranges of moderate elevation, which inclose many beautiful and fertile valleys. The principal ranges are the Flinders range, which trends northward from the e. coast of Spencer gulf to the neighborhood of lake Torrens, in lat. 30°, where it branches out into numerous spurs; and the Mount Lofty range, running nearly parallel with gulf St. Vincent from its head-water in lat. 34° to its termination at cape Jarvis. The Mount Lofty ranges rise to a height of about 2,600 ft., running about n.e. and s.w., having a breadth of over 15 miles. This district abounds in picturesque scenery, the summits being well wooded and the slopes of great beauty and fertility, affording eligible building-sites, and producing in the highest perfection many English fruits and vegetables.

Throughout South Australia the deficiency of running water is remarkable; in fact, for nearly 1200 m., following the indentations of the coast from the western boundary of the colony to the estuary of the Torrens, in gulf St. Vincent, not even a brook of permanent fresh water finds its way into the sea. See AUSTRALIA, VICTORIA.

Divisions, Towns, etc.—The colony naturally falls into three sections—South Australia proper, Central Australia, and the Northern Territory. The 38 counties serve for electoral purposes; the most important division is into districts, of which there were over 100 in 1885. Besides Adelaide, the capital, with its 125,000 inhabitants, there are several townships with over 2000 and many others with more than 1000. Port Adelaide, 7½ m. from the capital, is the chief harbor; but there are several excellent minor ports.

Mineral Wealth, etc.—The mineral wealth of South Australia is great, the principal metals being copper, lead, and iron; the last is of the finest quality, but, in the absence of coal, cannot be profitably worked. The principal copper-mines are the Burra-Burra and the Kapunda, to the n.e. of St. Vincent gulf; the Wallaroo and Moonta, on York's peninsula. Four gold fields were being worked in 1880. Mineral oil and marble have been found.

Government, etc.—There are two houses of parliament, both elective. The whole colony is thrown into one electoral district for electing members to the council on a low property franchise, and for a period of 12 years. Members of the assembly are elected by universal suffrage for 3 years. Voting for both houses is by ballot. The executive government is dependent on parliamentary majorities, as in England. No pecuniary aid is given by government to any religion, and all churches are placed on a footing of perfect equality. The system of public education is modeled on the Irish national system. Attendance is compulsory. Six members of the council retire every four years.

In 1890 the pop. of South Australia amounted to 324,484. In 1881 it was 279,865, besides aborigines numbering about 4000. The imports for 1889 were of the value of £6,804,451; and the exports, £7,259,365. The exports consisted chiefly of corn, wool, and copper. The revenue, derived principally from the sale of crown lands and customs dues, amounted in 1890 to £2,478,981; the expenditure, to £2,404,179; and the public debt, spent in reproductive works, to £20,435,500. The colony has an extensive system of electric telegraphs. An overland line, constructed at the expense of the South Australian government, and opened in 1872, runs from Adelaide to Port Darwin, across Central Australia, a distance of 2000 m., and through junction with the Anglo-Indian line, connects Australia with all the great centres of civilization.

SOUTH BEND, city and co. seat of St. Joseph co., Ind.; on the St. Joseph river and the Chicago and Grand Trunk, the Indiana, Illinois, and Iowa, the Lake Shore and Michigan Southern, the Michigan Central, and the Vandalia line railroads, 88 miles e. of Chicago. It is the seat of the university of Notre Dame and of St. Joseph's and St. Mary's academies (all R. C.), and has a high school, public library, the Catholic reference library of America, several school libraries, Protestant and Roman Catholic hospitals, national and savings banks, building and loan associations, electric lights, electric street railroads, waterworks supplied from artesian wells, over 20 churches, and daily, weekly, and monthly periodicals. The U. S. census in 1890 reported for South Bend, 208 manufacturing establishments, employing a capital of \$11,252,887, and having a combined output valued at \$9,812,513. The city is especially noted for its manufactures of carriages, wagons, agricultural implements, and sewing machines. Pop. '90, 21,819.

SOUTH BETHLEHEM, a borough in Northampton co., Pa., on the Central of New Jersey, the Lehigh Valley, and the Philadelphia and Reading railroads; 57 m. n.w. of Philadelphia. It is the seat of Lehigh university (q. v.), and has St. Luke's hospital, electric lights, electric street railroads, waterworks supplied from the river, national and private banks, and about a dozen churches. The principal industrial plants are the Bethlehem iron works, the Lehigh zinc and iron company, the Bethlehem foundry and machine company, and the Lehigh Valley silk mills. Pop. '90, 10,386.

SOUTHBIDGE, a town in Worcester co., Mass.; on the Quinebaug river and the New York and New England railroad; 20 miles s.w. of Worcester. It contains the villages of Globe, Sandersdale, and Southbridge; was incorporated in 1816; and has manufactories of cotton and woolen goods, spectacles, cutlery, and boots and shoes. Pop. '90, 7655.

SOUTH CAROLINA, a southern Atlantic state, and one of the original 13; between lat. 32° and 35° 13' n.; long. 78° 28' and 83° 18' w.; bounded on the n. and n.e. by N. Carolina; on the s.e. by the ocean; on the s. and s.w. by Georgia, Savannah River separating; extreme length, e. to w., 240 m.; greatest breadth about 210 m.; land area, 30,170 sq. m.; gross area, 30,570 sq. m., or 19,564,800 acres.

HISTORY.—In May, 1562, Ribault, the Huguenot, discovered the harbor of Port Royal, named it, and built Fort Carolina on an island there, but the colonists shortly rebelled and returned to Europe. In 1670, a party of English under William Sayle founded Port Royal, but ten years later removed to the present site of Charleston, the territory at that time being only a part of the Carolina province. Many French Huguenots found their way thither in 1685, and Scotch, Irish, Swiss, and German emigrants followed. Representative government was established as early as 1670. In 1729 the province was divided into North and South Carolina by Charles II., and from that time on it increased in population and prospered, notwithstanding much molestation by the Indians and also by the Spaniards in Florida. During the revolution important battles occurred at Charleston, Fort Moultrie, Camden, King's Mountain, Cowpens, and Eutaw Springs. A state constitution was adopted Mar. 26, 1776, and the constitution of the U. S. was ratified in 1788. From the first the state was prominent in the South. Its wealth increased rapidly, and its political leaders gave it distinction and influence. The most important event in its history for seventy years was brought about by John C. Calhoun, who in 1832, with other leading men of the state, attempted to nullify certain acts of Congress imposing a tariff, believing that it bore unjustly on the interests of the state. During some months this defiance of the national authority threatened future trouble; but prompt measures adopted by President Jackson restored order. The desire to maintain extreme state-rights, however, continued to be prominent in South Carolina politics; and in 1860, when indications of civil war were apparent, it was the first state that seceded from the Union. The legislature met in Charleston, and on Dec. 20 passed an ordinance of secession by a unanimous vote. In April, 1861, the bombardment of Fort Sumter, in Charleston harbor, precipitated the war, and during the next four years the state suffered severely, its harbors either being blockaded or captured one by one, and much of its property being destroyed by federal troops on the great march through the state, under Gen. Sherman. After peace was declared and reconstruction began, a great deal of trouble ensued for several years through the constant disagreement between the whites and the colored people and their leaders. A convention held in Columbia, in Sept., 1865, repealed the ordinance of secession and declared slavery abolished. The state was put under military surveillance; a registration of voters held, which resulted in qualifying 78,982 colored and 46,346 white voters; and a general election followed. The new legislature was largely composed of colored men, and many of the state officers and some of the members of congress were also colored. The constitution, which, after some delay, was framed and accepted, was similar to those required of other Southern States for their re-admittance to the Union. Altogether, South Carolina has had more difficulty in regaining its former prosperity than any of the other former Confederate States except Louisiana.

TOPOGRAPHY.—The Blue Ridge, passing through the northwest part of the state, rises to an elevation (Table Mountain) of 4000 ft. From this a series of terraces descends to what is called the middle country, consisting of low sand-hills. From this region to the coast, from 80 to 100 m., the surface is low and often marshy. The seaboard is about 210 miles in length. Among the many islands are Edisto and Hilton Head. The principal river, the Santee, 150 miles long, is formed by the junction of the Wateree and Congaree, and the latter by the union of the Saluda and Broad. The Great and Little Pedee, Waccamaw, and Black empty into Waccamaw bay; the Cooper and Ashley, into Charleston harbor; the Edisto and Combabee, into St. Helena sound; the Oosawahatchie into Port Royal harbor.

GEOLOGY AND MINERALOGY.—The hilly or upper part of the state is chiefly eozoic, bordered on the southeast by Silurian strata. The level pine lands and coast region are referred to the tertiary and quaternary age, and along some of the rivers are exposed cretaceous areas. Iron ore is abundant in the northwest countries, and at Abbeville and Edgefield, gold is mined. Other minerals are bismuth, silver, zinc, lead, manganese, graphite, kaolin, granite, and building-limestone. The phosphate marl beds of the coast are of great extent and value.

ZOOLOGY AND BOTANY.—Among wild animals, birds, and fowl are the deer, bear, opossum, raccoon, ground-hog, rabbit, squirrel, eagle, buzzard, hawk, turkey, snipe, and grouse. The reptiles include the alligator, tortoise, and about 17 species of serpent; the fish, the sturgeon, shad, herring, and rockfish. The long and the short leaved pine abound, also the black jack, live, scrub, red and post oak, hickory, black walnut, sugar maple, ash, beech, elm, hemlock, cypress, willow, bay, tulip-tree, sycamore, laurel, and especially the palmetto, which figures on the state seal, giving the name of "the Palmetto State" to South Carolina.

CLIMATE, SOIL, AND AGRICULTURE.—The climate in general is mild and even. The mean annual temperature of the mountain region resembles that of New Jersey or Kansas; in the sand-hill region it is from 62° to 50°. The mean annual temperature at Charleston is 65.06°, at Columbia, 62.03°. The yearly rainfall is about 48 inches.

The tide swamp-lands are adapted to rice; the inland swamp-lands to rice, cotton, corn, and peas; the salt marsh-lands to long cotton; the oak and pine-uplands to long cotton, corn, and sweet potatoes; the pine barren, or "middle country," to fruits and vegetables, and the mountain slopes to corn and grains, and the valleys to cotton. The sea islands contain both swamp-lands and up-lands. Cotton and rice are the leading products, but corn, hay, sorghum, potatoes, fruits, and vegetables are more profitable, and the acreage devoted to them is increasing rapidly. Figs, grapes, peaches, plums, pears, pecans, almonds, etc., thrive, and on the coast, oranges and olives. The pitch-pine forests yield rosin and turpentine. The principal cereal productions in the order of value of crops are corn, oats, and wheat. The cotton crop averages about 800,000 bales per annum, and the hay crop exceeds \$2,000,000 in value. Of live-stock, hogs, oxen, cows, mules, sheep, and horses are the most numerous, in their order, the total value averaging about \$17,000,000, agricultural interests have been reduced largely by the development of manufacturing, and many rice-fields have been converted into cattle ranges.

INDUSTRIES.—The water power of the upper and middle cos. is ample, but in the coast region, where the streams flow sluggishly, steam is generally employed. The U. S. census of 1890 reported for South Carolina, 2382 manufacturing establishments, employing \$29,276,261 capital and 24,662 persons, paying \$6,590,983 for wages and \$18,873,666 for materials, and having a combined output valued at \$31,926,681. The principal manufactures are cotton and woolen goods, fertilizers, flour and grist mill products, lumber products, tar and turpentine, and cotton-seed oil and cake. In 1895 there were 62 cotton and woolen mills, with 838,036 spindles and 21,573 looms, and during 1896 charters were granted for 12 new cotton mills and 6 cotton oil mills. The phosphate mining industry, on which the state receives a royalty of \$1 per ton, has been decreasing steadily for several years, owing to valuable finds elsewhere.

COMMERCE.—Charleston, Beaufort, and Georgetown are the ports of entry. Foreign commerce centers mainly at Charleston. The chief articles of export are rice, cotton, phosphates, lumber, naval stores, cotton-seed oil, fish, fruits, and spring vegetables. In the year ending June 30, 1897, the imports of merchandise at the ports of Beaufort and Charleston aggregated in value \$1,101,723; and the exports of merchandise at the three ports, \$14,151,640.

TRANSPORTATION.—The railroads of the state are mostly owned or controlled by three large systems, the Southern, the Seaboard Air line, and the Atlantic Coast line. The total mileage in operation is about 2800; cost of roads and equipment, over \$55,000,000; total investment, over \$57,000,000. The mileage in the state of roads belonging to other states is considerable. The net income of all roads in 1896 was over \$2,300,000; aggregate of railroad taxes paid to the state, over \$300,000 per annum.

BANKS.—In Oct., 1896, there were 15 national banks in operation, with capital \$1,848,000, deposits \$4,294,408, and reserve \$1,047,462; 22 state banks, with capital \$1,392,250, deposits \$1,970,371, and resources \$4,391,447; and 7 stock savings banks, with capital \$439,155, deposits \$4,322,477, and resources \$5,393,707.

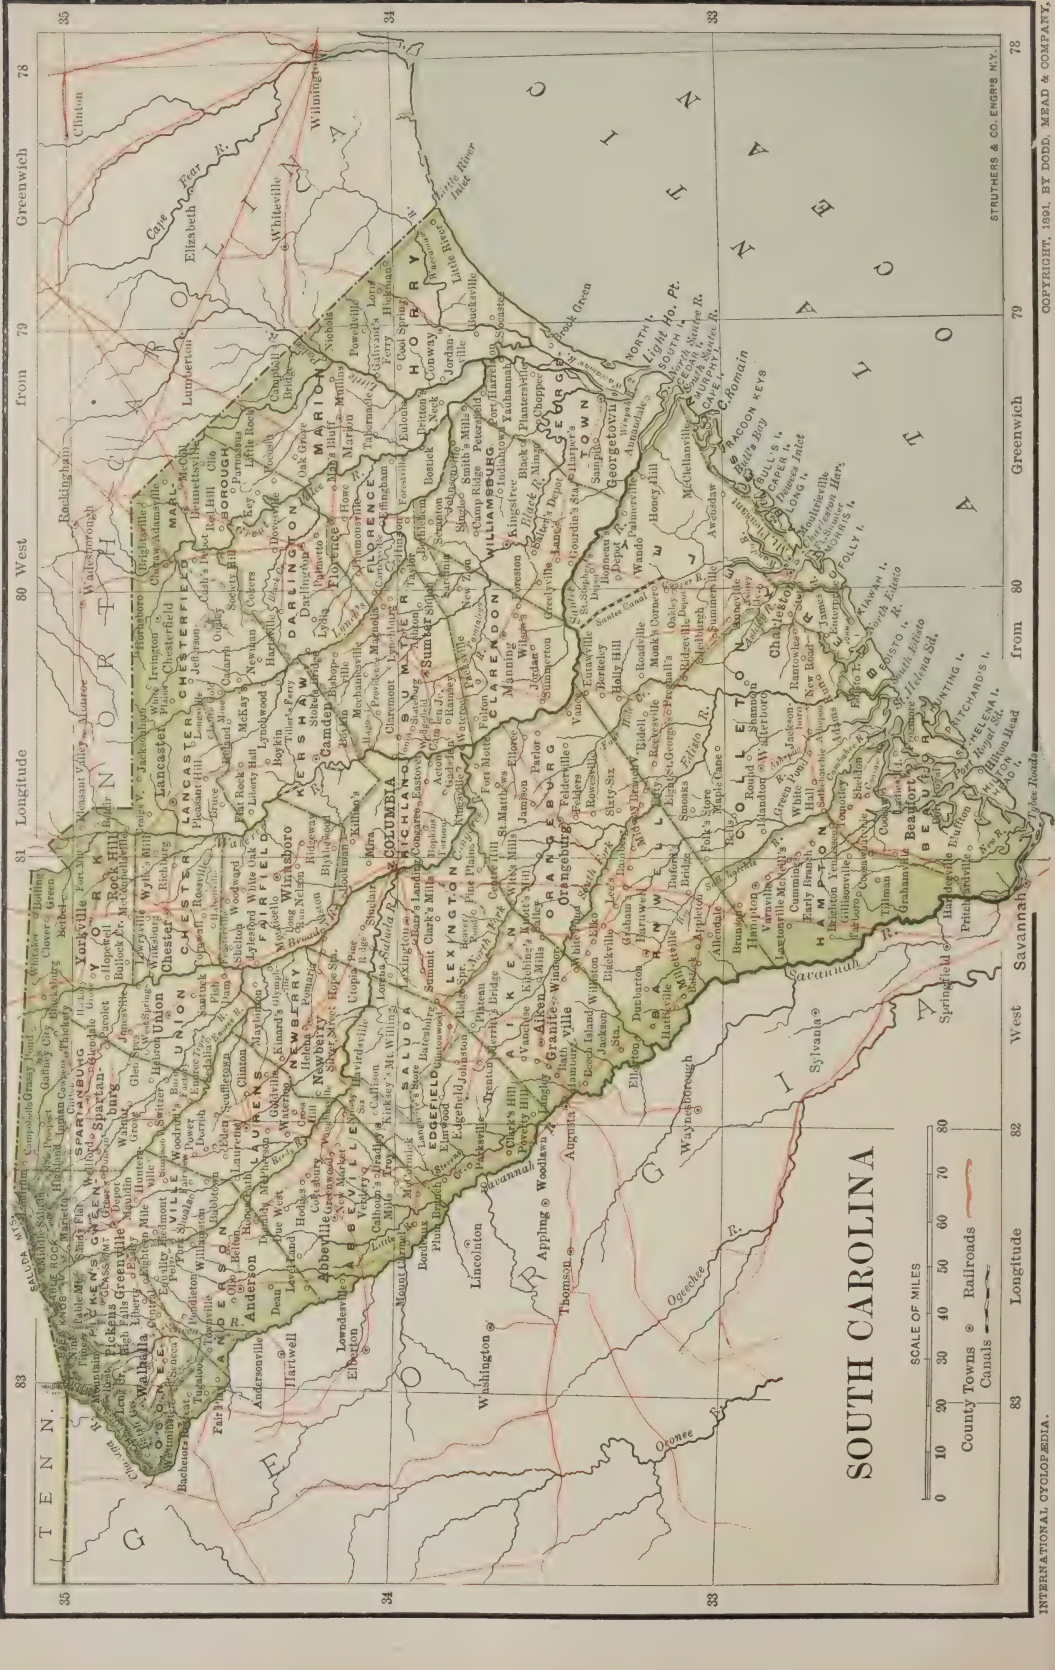

CHURCHES, EDUCATION, ETC.—The leading denominations are the Baptist, Methodist Episcopal South, Methodist Episcopal, Presbyterian, Protestant Episcopal, and Roman Catholic. Free schools were established by the constitution of 1868. In 1895 there were 459,700 persons of school age; the number enrolled was 223,021, and the average attendance, 159,254. The state university comprises South Carolina college, Columbia; South Carolina military academy, Charleston; Clemson agricultural and mechanical college, Clemson college station; and Winthrop normal and industrial college, Columbia. Other advanced institutions include the college of Charleston, Erskine college, Furman university, Newberry college, Claflin university, Allen university, Presbyterian College of South Carolina, Wofford college, several colleges exclusively for women, and numerous normal and industrial schools for white and colored pupils. There is a state medical college at Charleston, and an institution for the deaf and the blind at Cedar Springs. In 1896 there were 32 libraries of 1000 volumes and upward each, with an aggregate of over 230,000 volumes; and about 125 periodicals of all kinds.

GOVERNMENT, ETC.—The capital is Columbia. The constitution of 1868 required as qualifications for suffrage a residence in the state for two years, in the county one year, and in the polling precinct four months; registration; the ability to read or understand the constitution; and the payment six months before an election of any poll tax then due. Under the constitution adopted in 1895, the requirements after Jan. 1, 1898, are that a person applying for registration, if otherwise qualified, must be able both to read and to write any section of the constitution, or show that he owns and has paid all taxes collectable during the previous year on property in the state assessed at \$300 or more. The sessions of the legislature were changed to the second Tuesday in January of each year, with a time limit of 40 days. Common schools are required to be separate and distinct for white and colored children, and pupils of either race are prohibited from attending the schools so set apart for the other race. The supreme court consists of a chief justice and three associate justices, elected by the legislature for eight years each. A bill to introduce the Australian ballot system was defeated in the legislature, but the old ballot law was materially amended. The state dispensary was transferred to a state board of control, but the U. S. supreme court in 1897 declared the entire liquor dispensary legislation void on account of violating the federal constitution. The state pays an annual pension to every indigent or disabled soldier or sailor of the confederacy who is a citizen of the state, and to the indigent widows of confederate soldiers and sailors of the state. The electoral votes have been cast as follows:

SOUTH CAROLINA

1788, Washington, 7, vice-president divided; 1792, Washington, 8, vice-president divided; 1796, Jefferson and Pinckney, 8; 1800, Jefferson and Burr, 8; 1804, Jefferson and Clinton, 10; 1808, Madison and Clinton, 10; 1812, Madison and Gerry, 11; 1816, Monroe and Tompkins, 11; 1820, Monroe and Tompkins, 11; 1824, Jackson and Calhoun, 11; 1828, Jackson and Calhoun, 11; 1832, Floyd and Lee, 11; 1836, Mangum and Tyler, 11; 1840, Van Buren and Tazewell, 11; 1844, Polk and Dallas, 9; 1848, Cass and Butler, 9; 1852, Pierce and King, 8; 1856, Buchanan and Breckinridge, 8; 1860, Breckinridge and Lane, 8; 1868, Grant and Colfax, 6; 1872, Grant and Wilson, 7; 1876, Hayes and Wheeler, 7; 1880, Hancock and English, 7; 1884, Cleveland and Hendricks, 9; 1888, Cleveland and Thurman, 9; 1892, Cleveland and Stevenson, 9; 1896, Bryan and Sewall, 9.

The state penitentiary, state hospital for the insane, state orphan asylum, and state institution for the deaf and the blind are at Columbia. The state maintains farms for convict labor, and the counties, almshouses, and jails.

FINANCES.—The funded debt, 1890, was \$6,603,490; receipts, \$1,190,036; expenditures, \$1,112,092; amount raised by taxation, \$723,151; 1896, value of real estate, \$100,976,705; personal property, \$45,838,607; railroad property, \$23,940,162; total taxable property, \$170,755,474; total taxes, \$2,317,889.

POPULATION.—In 1790, 249,073—107,094 slave, 1801 free col'd; 1820, 502,741—258,475 slave, 6826 free col'd; 1840, 594,398—327,038 slave, 8276 free col'd; 1860, 703,708—402,406 slave, 9914 free col'd; 1880, 995,577—604,332 col'd, 131 Indians; foreign born, 7686; male, 490,408; female, 505,169; dwellings, 191,914; families, 202,062; persons to sq. m., 33; engaged in agriculture, 294,602; pop. 1890, 1,151,149. There are 36 cos.; for pop. 1890, see **APPENDIX**, vol. XV. The only cities of large size are Charleston; pop. 1890, 54,955; and Columbia, pop. 15,353.

SOUTHCOTT, JOANNA, a curious specimen of the religious visionary, was b. in Devonshire, England, of humble parentage, about 1750. In her youth she was a domestic servant, chiefly in Exeter; joined the Methodists, and becoming acquainted with a man named Sanderson, who laid claim to the spirit of prophecy, made similar pretensions herself. She received encouragement from some weak-minded clergymen of the church of England. In 1792, she declared herself to be the woman driven into the wilderness, the subject of the prophecy in Rev. xii. She gave forth predictions in prose and verse, and although very illiterate, wrote numerous letters and pamphlets, which as well as her prophecies in verse, or rather in doggerel, were published, and found many purchasers, and many received her pretensions as genuine. One of her productions was the *Book of Wonders*. Thousands of both sexes received them with implicit confidence, among whom were men of good education and respectable position in society. At length she imagined herself to have symptoms of pregnancy, and announced that she was to give birth, at midnight on Oct. 9, 1814, to a second Shiloh, or prince of peace, miraculously conceived, she being then more than 60 years of age. The expected birth did not take place, but on Dec. 27, 1814, the woman died. On a post-mortem examination, it was found that the appearance of pregnancy which had deceived others, and perhaps herself, was due to dropsy.

SOUTH DAKOTA, a north-western state of the American Union, lies between lat. 42° 28' and 46° n.; long. 96° 25' and 104° 5' w., and is bounded on the n. by North Dakota; on the e. by Minnesota and Iowa; on the s. by Nebraska; on the w. by Wyoming and Montana; average length from e. to w., 386 m.; av. breadth, 240 m.; gross area, 77,650 sq. m., or 49,696,000 acres; land surface, 76,850 sq. miles.

HISTORY.—The region now comprising the states of North and South Dakota was included as a whole in Louisiana and Missouri territories successively, and afterwards was divided among the territories of Michigan, Wisconsin, and Iowa. As early as 1827, trading houses were erected on the Dakota river, and in 1829, Pierre Choteau, of St. Louis, built Ft. Pierre not far from the present site of the city of Pierre. In 1849, eastern Dakota was made part of Minnesota territory, and Dakota, west of the Missouri and White Earth rivers, was known as Mandan territory until May 30, 1854, when Nebraska territory was formed, of which it became a part. After the formation of the state of Minnesota, Dakota had neither legal name nor existence, but in 1861, Mar. 2, a temporary government was provided, and Yankton was made the capital. The first legislature met on Mar. 17, 1862. Settlements were made in 1856 at Sioux Falls, and in 1859 at Yankton, but immigration was delayed by Indian outbreaks in 1858 and 1862. In 1863, Idaho (with Montana), and in 1868, Wyoming, were set off. In 1883, Sept. 4, a convention at Sioux Falls framed a constitution for the people south of the 46th parallel, which was adopted in Nov., and under it state officers and members of Congress were chosen, but the constitution never went into effect. In 1885, Sept. 8, a constitutional convention for South Dakota met at Sioux Falls, and on Nov. 3 the constitution framed was adopted. A governor was elected under it, and Huron was selected as the temporary capital. In 1887, Nov. 8, at a special election, and in 1888, July 10, 11, at a general convention, the people voted in favor of a division of Dakota territory. In 1889, Feb. 22, an "omnibus bill," admitting the Dakotas, together with Washington and Montana, was approved by the president. On May 14, the Sioux Falls constitution was adopted, and on Oct. 1 was ratified, state officers, members of the legislature, and congressional representatives being chosen. On Nov. 3, the state of South Dakota was admitted to the Union.

TOPOGRAPHY.—The Missouri river, flowing south and southeast, divides the state into nearly equal portions. East of that river the surface is chiefly a vast plain, including the "great plateau" of the Missouri, and a somewhat similar plateau east of the James river. The Wessington and Ree hills in Hand co., and the Bijou hills in Brule Co. are prominent elevations. West of the Missouri the surface is more broken, and the Black hills have an average elevation of nearly 6000 ft. The total area of the Black hills is about 3200 sq.m., and the highest elevation, Harney's peak, is 7368 ft. above the sea. The principal rivers east of the Missouri are the Dakota or James, which has its source in North Dakota, and joins the Missouri below Yankton, and the Big Sioux, which rises in the state, forms a part of the eastern boundary, and empties into the Missouri at the extreme south-eastern point of the state. The chief streams west of the Missouri, and all tributary to it, are the Grand, Moreau, Cheyenne, and White. Lakes are numerous. Big Stone and Traverse lakes, each about 25 m. long, form part of the northeast boundary. The hot springs of Fall River co., in the Black hills, are widely famed, and there are sulphur springs in Jerauld co. Artesian wells of great depth and pressure are common in the eastern cos. The bad lands (q.v.) are of extraordinary interest to the tourist and artist.

GEOLOGY AND MINERALOGY.—The Black hills consist of a central mass of granite, around which are arranged, concentrically, rocks of the archæan, cambrian (Potsdam), carboniferous, triassic, jurassic, cretaceous, and tertiary periods. It is believed that the Dakotas "lay in the path of a great continental glacier," and that the deep deposits of gravel, sand, and clay, of the eastern plains, were brought down from the eroded mts. lying to the north. During the post-glacial period, Dakota is believed to have been covered by a vast inland sea, into which the Missouri and other streams poured sediments from the cretaceous and tertiary rocks pulverized by the glaciers of the north. The river valleys were cut out by erosion, and the effects of this mighty force are seen at altitudes of several thousand ft. in the Black hills. The Black hills constitute one of the richest mineral regions of the United States. Quartz gold is found throughout the archæan rocks, but mainly in the north, where Deadwood and Lead City are important mining centres. Placer gold is found in the beds of all the streams in the archæan area, and both gold and silver are obtained from the Potsdam rocks of the northern hills. Tin, which is found in three counties, was discovered in 1893. The mines are numerous, and among important centres are Spearfish and Custer. Mica is mined with the tin. The archæan and Potsdam rocks yield copper. Among other products of this remarkable region are antimony, arsenic, asbestos, cobalt, fire and pottery clays, gypsum, graphite, iron, lead, nickel, building limestone, porphyry, salt, saltpeter, sandstone and zinc. The greater part of the state, west of the Missouri, is underlaid with a deposit of lignite coal of excellent quality. Clay, suitable for brick and terra-cotta, abounds everywhere. At Sioux Falls, Dell Rapids, and elsewhere in the southeast, there are extensive quarries of beautiful quartzite or jasper. Oil has been found in the Black hills, and natural gas in the same section, as well as in the Missouri and Dakota river valleys.

ZOOLOGY AND BOTANY.—The wild animals, birds, etc., are those found in Minnesota and other adjoining states. The Black hills derive their name from the dense and dark forests of yellow pine which formerly covered them, and here, too, are found on the slopes and in the valleys, the black and white spruce, burr oak and white elm, with, more sparingly, the aspen, white birch, ash, mulberry, ironwood, juniper, sumach, hazel, and box elder. Along the Missouri and its tributary streams grow the cottonwood, ash, willow, etc. Wild fruits grow in great profusion, the plum, grape, raspberry, strawberry, choke cherry, buffalo berry, etc. Rich grasses cover the prairies of the east, and the Black hills and Bad Lands offer equal inducements to the stock-raiser and dairy farmer.

CLIMATE, SOIL, AND AGRICULTURE.—The atmosphere is dry and free from humidity. The winters are cold but invigorating, and less snow falls than in states south and east. The winters break suddenly, usually in Mar., and seeding and farm planting generally begin in the latter part of the month. Summer time is marked by warm days and cool nights. The mean annual temperature at Deadwood is 42.1°; at Fort Sully, 45°. The soil is a light but rich loam, overlying a fertile clay subsoil. Corn, oats, barley, buckwheat, rye, flax, hops, potatoes, alfalfa, and millet are among the farm products. The grains are cultivated with great success, and attain a size and solidity of berry elsewhere unknown. The adaption of the soil and climate to the growing of all cereals is manifested in the perfection of the grain and the large yield of the crops. Apples, plums, grapes, strawberries, currants, gooseberries, are raised successfully. The quality and quantity of the yield of vegetables of all kinds are remarkable.

MANUFACTURES.—The U. S. census of 1890 reported for South Dakota, 499 manufacturing establishments, employing \$3,207,796 capital and 2,422 persons, paying \$1,098,418 for wages and \$3,523,840 for materials, and having a combined output valued at \$5,682,748. The principal manufactures are flour and grist mill products, lumber products, brick and tile, and dairy products. There are valuable granite, sandstone, and limestone quarries. The estimated output of the Black hills region in 1896 was gold, \$8,240,000, silver and copper, \$1,260,000.

BANKS.—In Oct., 1896, there were 30 national banks in operation, with capital, \$1,960,000, and deposits, \$4,000,345; 80 state banks with capital, \$1,042,110, and deposits, \$1,884,501; and 70 private banks with capital, \$1,144,592, and deposits, \$1,469,408.

RAILROADS.—The state is well equipped with railroads, being crossed by several great trunk systems, and having a large number of local roads. The length of trunk and local lines exceeds 2800 miles.

RELIGIOUS DENOMINATIONS, EDUCATION, ETC.—The leading denominations numerically are the Methodist Episcopal, Congregational, Presbyterian, Baptist, Roman Catholic, and Protestant Episcopal. There are about 105,000 children of school age in the state, over 3600 public school-houses, public school property valued at \$3,500,000, and a permanent school fund of over \$2,000,000. The higher institutions are the State university, Vermilion; agricultural and mechanical college and experiment station, both at Brookings; school of mines, Rapid City; normal schools at Madison, Springfield, and Spearfish; Sioux Falls univ. (Bap.); Yankton college (Cong.); Redfield college (Cong.); Dakota university (M. E.), Mitchell; Pierre univ. (Presb.), East Pierre; Black Hills college (M. E.), Hot Springs; All Saints' school (P. E.), Sioux City; convent and school of the Sacred Heart (R. C.), Yankton; and Augustana (Luth.) college, Canton.

GOVERNMENT, ETC.—The capital is Pierre. The Sioux Falls constitution provides that the total aggregate debt of the state, with all previous debts, shall never exceed \$500,000; that the house of representatives shall consist of not less than 75 nor more than 135 members, and that the number of members of the senate shall not be less than 25 nor more than 45. The sessions shall be biennial, and the legislature first chosen shall consist of 33 senators and 99 representatives. No person convicted of an infamous crime, no defaulter for public moneys, and, with minor exceptions, no person holding a lucrative office under the state, the United States, or any foreign government, can be elected to the legislature. The terms of office of members shall be two years; they shall receive \$5 for each day's attendance and 10 cts. for every mile of necessary travel. Except in cases of impeachment, sessions shall not exceed 60 days. The executive power is vested in a governor and lieutenant-governor, elected for two years, the latter being, *ex-officio*, pres. of the senate. The governor has a veto power on legislation, which may be overridden by a two-thirds vote of both houses. He may veto items of an appropriation bill and approve the rest. The other officers are a sec. of state, auditor, treasurer, supt. of instruction, commissioner of school and public lands, and attorney-gen., severally holding office for two years. The supreme court consists of three judges, elected from districts, with appellate and supervisory jurisdiction only, and elected for four years; subsequently the number may be increased, and the term is to be six years. The circuit courts, six in number, are the courts of general original jurisdiction. There are also co. courts, justices of the peace, and special courts for cities and incorporated towns. A residence of one year in the United States, six months in the state, thirty days in the county, and ten days in the election precinct is required of voters. The legislature may not pass special legislation laws. Corporate powers are restricted, and the right of the state over them is maintained. All property acquired by a woman before marriage is inalienably hers, as well as all to which she is rightfully entitled after marriage. A state prohibition law was adopted in 1891, contested, and affirmed. The electoral votes of the state have been cast as follows: 1892, Harrison and Reed, 4; 1896, Bryan and Sewall, 4.

The bonded indebtedness of the state in 1896 was \$1,085,960; its assessed valuation, over \$119,000,000. The state institutions include a penitentiary and a school for deaf-mutes at Sioux Falls, a hospital for the insane at Yankton, a state industrial school at Plankinton, and a soldiers' home at Hot Springs.

POPULATION.—In 1885 this was est. at 260,721; in 1890 it was 328,808. The foreign pop. is largely Scandinavian and German. The Indians numbered 19,068 in 1890. There are 52 organized cos. In 1890 the only city having a population exceeding 10,000 was Sioux Falls, 10,177. Other important places are Aberdeen, Pierre, Rapid City, Huron, Watertown, Yankton, Deadwood, and Mitchell.

SOUTHERN, THOMAS, 1660–1746; b. Ireland; educated at Trinity College, Dublin; entered at the Middle Temple, but abandoned law for dramatic literature, and became a popular writer of plays. His principal tragedies were the *Persian Princess*; *Isabella, or the Fatal Marriage*; *Oroonoko*; and comedies, *The Disappointment*; *The Rambling Lady*; *The Wives' Excuse*. He is said to have been the first English writer who denounced the slave-trade in *Oroonoko*. A collection of his plays with a memoir was published in 1774 in 3 vols.

SOUTHERN CROSS, THE, a constellation near the South Pole in the zone of the milky way. See **GALAXY**. Of its four principal stars, one, the southernmost, is of the first magnitude; two, the eastern and northern, of the second; and one, the western, of the third. All of these, except the northern, are white; this is a pale orange. A fifth star of the fourth magnitude is described by Sir John Herschel as a "most intense red."

SOUTHEY, CAROLINE ANN BOWLES, English author, was born at Lymington, Hants, in 1786, and was the only child of Capt. Charles Bowles, a retired officer. Reverses obliging her to earn her living, she decided to try literature, and about 1820 sent to Southey, the poet, a narrative poem, *Ellen Fitzarthur*, subsequently published. The correspondence that ensued led to a friendship, and to their marriage in 1839. Her health, already frail, was much impaired by her devotion to her unfortunate husband, but she survived him, dying in 1854. Her works include, *The Widow's Tale and other Poems* (1822); *Solitary*

Hours (prose and verse), 1826; *Tales of the Moors* (1828); *Chapters on Churchyards*, considered her best work (1829); *Tales of the Factories* (1833); *Selwyn in Search of a Daughter* (1835); *The Birthday* (1836); and *Robin Hood*, written in conjunction with her husband, but never published. See *Southey's Correspondence with Caroline Bowles*, edited by Prof. Dowden.

SOUTHEY, ROBERT, was b. Aug. 13, 1774, at Bristol, in which city his father was a linen-draper. In 1788 he was sent to Westminster school by his maternal uncle, the Rev. Herbert Hill, chaplain to the English factory at Lisbon, who undertook the charge of his education, his father's pecuniary affairs having become much embarrassed. At Westminster he much distinguished himself; but in 1792 a trivial insubordination led to his expulsion; and next year he was entered at Balliol College, Oxford, with a view to his taking orders. This, however, he ultimately declined to do, having been led by his sympathy with the French revolution, into a considerable departure from the orthodox civil and religious standards. In 1794, he left Oxford, having published the year before, in conjunction with his friend Robert Lovell, a small volume of poems, the first literary venture of a life thenceforward to be almost wholly devoted to literature. Shortly after, he received from Cottle, for his first poem of any length, *Joan of Arc*, the sum of £50; and in Nov., 1795, he was married to a Miss Fricker of Bristol; Coleridge, with whom he had become intimate, on the same day marrying a sister. After passing some little time with this uncle in Portugal, engaged in a diligent study of the language and literature of that country and of Spain, he became a student of law at Gray's Inn. Here he worked at his new poem of *Madoc*, and learned nothing whatever of law, a pursuit which he speedily relinquished as hopeless. In 1801 he accepted a situation as secretary to Mr. Corry, chancellor of the exchequer for Ireland; but finding its duties distasteful to him, he very soon threw it up, and finally betook himself to literature as his sole source of livelihood.

In 1804 he settled himself at Greta Hall, near Keswick in Cumberland, where he spent the remainder of his life, working with the regularity of a machine, happy in his family relations and his unremitting daily round of congenial, though continuous toil. His biography thence onward for 40 years, till the pen dropped from his fingers, might be summarized in the list of his works, which of itself would fill a page or two. In addition to these formal publications, he wrote largely for various periodicals, notably for the *Quarterly Review*, to which, from its establishment in 1809—having now become as violently conservative in his views as in youth he had been revolutionary—he was a most constant and valued contributor.

In 1807, in consideration of his services to literature, a pension of £160 per annum was awarded him; and in 1813, on the death of Mr. Pye, he succeeded him as poet laureate. Through Sir Robert Peel, in 1835, he received a further pension of £300, and along with it the offer of a baronetcy, which, however, he decided to decline. His first wife dying in 1837, he, two years after, was married to Miss Caroline Bowles. On March 21, 1843, he died, his few last years having for the most part been passed in a state of painful mental stupor, which incapacitated him for literary exertion.

Southey's poetry—except in a few of his shorter ballad pieces—can at no time be said to have been popular, and is now nearly forgotten. His chief works are *Madoc*, *Thalaba*, *The Curse of Kehama*, and *Don Roderick*, of which the last two are reckoned the best. In all of them are to be found noble passages, in which an ample and stately rhetoric counterfeits with surprising success the pure instinct of music; but they rather skillfully illustrate the art and technic of poetry than breathe its essential life. As a prose writer he ranks high; his style is easy, lucid, agreeable, nicely modulated throughout, and readily rising into eloquence on suggestions of sentiment and subject. His life and correspondence, edited by his son, was published in 6 vols. (1849); and a selection from his letters (1856); his *Correspondence with Caroline Bowles* (1881).

SOUTHGATE, HORATIO, D. D., B. M., in 1812, graduated at Bowdoin college in 1832, and Andover theological seminary in 1835; ordained in the Protestant Episcopal church in 1836; bishop of Constantinople, 1844-50; resigned, and was elected bishop of California in 1850, but declined; rector of St. Mark's church, Portland, Me., 1851-52, and of the church of the Advent in Boston, 1852-58. He published *Tour in Armenia, Kurdistan, etc.* (2 vols.); *Practical Directions for Lent*; *Visit to the Syrian Church of Mesopotamia*; *The War in the East*; *Parochial Sermons*. He died, 1894.

SOUTHINGTON, a town in Hartford co., Conn.; on Quipiac river; and on the New York, New Haven and Hartford railroad; 22 miles north of New Haven. Originally a part of Farmington, and called Panthorn, it was settled about 1697, and was incorporated in 1779. It has the Lewis high school, electric street railroads, national and savings banks, about a dozen churches, a weekly newspaper, and manufactories of general hardware, tinnery machines and tools, wood screws, pocket cutlery, carriage hardware, bicycle supplies, bolts, etc. There are several villages and a borough of the same name. Pop. '90, 5501.

SOUTH KINGSTOWN, a town in Washington co., R. I.; on Block Island sound, and the New York, New Haven, and Hartford, and the Narragansett Pier railroads; 23 miles s. of Providence. It contains several villages, including Kingston, the co. seat, Perryville, Peace Dale, and Wakefield; was incorporated in 1722-3; and has the Rhode Island college of agriculture and the mechanic arts, high school, Robert B. Hale library,

Narragansett library, Kingston free library, Hazard memorial hall, electric lights, water-works, national and state banks, town hall, militia armory, G. A. R. hall, weekly newspaper, and manufactories of cotton and woolen goods, carriages, etc. Pop. '90, including the district of Narragansett, 6231.

SOUTH NORWALK, a city in Fairfield co., Conn.; on the Norwalk river, and the New York, New Haven, and Hartford railroad; 33 m. s.w. of New Haven. It is in the town of NORWALK (q. v.); has national and savings banks, electric lights, electric street railroads, daily newspaper, public library, the Roth and Goldschmidt free library, and manufactories of felt hats, locks, shoes, paper boxes, steam engines, machinery, bronze goods, air compressors, force pumps, etc.; and is in daily steamer communication with New York. Pop. '90, 4013.

SOUTH ORANGE, a township and village in Essex co., N. J.; on the Rahway river, and the Delaware, Lackawanna, and Western railroad; 5 miles n.w. of Newark, the co. seat. It is the seat of Seton Hall college (R. C.), and has several public and private schools, new town hall, public library, electric railroad communication with Newark and the other Oranges, gas and electric lights, and several handsome churches. South Orange is located on the Orange mountains, in a region of much natural beauty, largely built up by New York business men, and has many objects of interest to the tourist. Pop. '90, 3106.

SOUTH SEA SCHEME, THE, commonly designated the SOUTH SEA BUBBLE, was originated by Harley (q.v.), earl of Oxford, in 1711, with the view of restoring public credit, and providing for the extinction of the floating national debt, which at that time amounted to £10,000,000. This debt was taken up by a number of eminent merchants, to whom the government agreed to guarantee for a certain period the annual payment of £600,000 (being 6 per cent. interest), a sum which was to be obtained by rendering permanent a number of import duties. The monopoly of the trade to the South seas was also secured to these merchants, who were accordingly incorporated as the "South Sea company," and at once rose to a high position in the mercantile world. The company's trading projects had no other result than a single voyage of one ship in 1717, but they obtained a firm hold on popular favor, and the shares rose rapidly. Trusting to the possibility of pushing credit to its utmost extent without danger, they proposed, in the spring of 1720, to take upon themselves the whole national debt (at that time £30,981,712), on being guaranteed 5 per cent. per annum for $7\frac{1}{2}$ years, at the end of which time the debt might be redeemed if the government chose, and the interest reduced to 4 per cent. The directors of the bank of England submitted a counter-proposal, but parliament, against the protests of sir Robert Walpole, lords North and Grey, and others, accepted the South Sea company's offer. The prospect of amassing wealth led the directors to throw aside all scruples and to devise every means for keeping up the fictitious value of the stock. In the beginning of Aug. the shares were quoted at 1000, when the chairman and some of the principal directors sold out. A wide-spread uneasiness seized the holders of stock. The country now demanded the punishment of the fraudulent directors. The officials of the company were forbidden to leave the kingdom for twelve months, or to dispose of any of their property or effects. Ultimately it was proved that the earl of Sunderland, and others, had been bribed to promote the company's bill in parliament. Equally flagrant iniquity in the allocation of shares was discovered, in which, among others, Mr. Aislabie, the chancellor of the exchequer, was implicated. Through the partiality of parliament, Stanhope and the earl of Sunderland were acquitted; but Mr. Aislabie and the other directors, who were members of the house of commons, were expelled. Of the £13,300,000 of real stock belonging to the company, £8,000,000 was divided among the losers, giving them a dividend of $33\frac{1}{2}$ per cent.; and by other schemes of adjustment the pressure of loss was fairly and widely distributed. See Cox's *Walpole*, Mackay's *Popular Delusions*, and the various histories of England during this period.

SOUTH SHETLAND, or NEW SOUTH SHETLAND, an Antarctic archipelago lying about 600 miles s. of Cape Horn, between 61° to 63° 20' s. lat., and 54° to 63° w. long., separated from Graham's Land and Louis Philippe Land by the Bransfield strait. The islands are twelve in number, the chief of which are George, Livingston, Smith, Deception (with circular crater), Elephant, and Clarence. The total area is about 880 sq. miles. Ice and snow lie at the sea-level all the year. They were first discovered in 1599 by Dirk Gheritz. The region was explored by Sir John Ross in 1842, and in 1893 by Laskar in the "Jason," who determined the coast-line of Graham's Land to the 69th degree s. lat.

SOUTHWARK. See LONDON.

SOUTHWELL, ROBERT, 1562-95; b. England; educated on the continent; became prefect of the Jesuits' college at Rome in 1585; was sent in 1586 as a missionary to England; apprehended in 1592 on a charge of conspiracy against the government of queen Elizabeth; imprisoned in the Tower for three years, and though put to the torture ten times, confessed only that he came to England for the purpose of making converts to the Roman Catholic faith; was tried in court of king's bench, found guilty, and hanged at Tyburn in 1595, though there seems to have been scant proof of his crime. His important poems are contained in *St. Peter's Complaint and other Poems*, with a sketch of

his life. His chief prose works are *Triumph over Death*; *Epistle of Comfort*; *Marie Magdalen's Funeral Teares*. Complete editions of his works have been published.

SOUTHWORTH, CONSTANT, 1614-85; b. Leyden, Holland; came to New England in 1621 with his mother; was one of the colonists of Duxbury; often a member of the legislature; assistant-governor of Plymouth, and governor of the Kennebec plantation.

SOUTHWORTH, EMMA DOROTHY ELIZA (NEVITTE), b. Washington, D. C., in 1819; commenced writing tales and sketches for the *National Era*, Washington. She has published *Retribution*; *The Deserted Wife*; *Shannandale*; *The Curse of Clifton*; *The Lost Heiress*; *The Discarded Daughter*; *Cruel as the Grave*; *Tried for her Life*; *A Beautiful Fiend*; and many others. Her novels show strong dramatic power, are high in color, and have been popular. She has been a frequent contributor to the *New York Ledger*. Her complete works were published in Philadelphia in 35 vols.

SOUTHWORTH, NATHANIEL, 1806-58; b. Mass.; began the study of drawing in Boston and became a miniature painter of high rank in the profession. He went to Europe in 1848, and on his return resided in New York and Philadelphia.

SOUVAL'KY, or SUVALKY, chief t. of the government of the same name, in Poland, is situated on the left bank of the river Charnagarche, a tributary of the Niemen, 538 m. s.w. of St. Petersburg. Pop. '94, 17,519.

SOUVESTRE, EMILE, 1806-54; b. France. In 1820 he engaged himself as a publisher's clerk at Nantes; afterward earned his living as a journalist and litterateur, and in 1836 settled in Paris. After the revolution of 1848 he delivered popular lectures in the new school of administrative science, and later in Switzerland, which were published as *Causeries Historiques et Littéraires* in 1854. He wrote many didactic novels and tales, and his *Philosophe sous les toits* received an academical prize in 1851. Among his numerous novels are *Les Derniers Bretons*; *L'Homme et l'Argent*; *Confessions d'un Ouvrier*; and *Pierre et Jean*.

SOUZDAL', a t. of European Russia, in the government of Vladimir, noted as being one of the oldest towns in Russia, having, according to certain accounts, been founded 606 B.C. Pop. '80, 9,000.

SOVEREIGN, the name applied in politics to the person or body of persons in whom the legislative power of a state is vested. In limited monarchies, sovereignty is in a qualified sense ascribed to the king, who, though the supreme magistrate, is not the sole legislator. A state in which the legislative authority is not trammelled by any foreign power is called a sovereign state. The states of the German empire were designated *mi-souveraines*, because their sovereignty was qualified by their subordination to the imperial authority; and the same term may be applied to the states of the American union.

SOVEREIGN, an English gold coin of the value of twenty shillings sterling, the standard weight of which is 123.374 grains troy. The name was first applied to a gold coin issued in the reign of Henry VIII., otherwise called the double royal or rial, on which the king was represented in the royal robes. The name disappeared after a few reigns, and was revived as applicable to the gold piece of George III., issued in 1817, of the value of twenty shillings, which was substituted for the guinea, which had previously been current, of the value of twenty-one shillings. The sovereign is worth \$4.85.

SOWEREAD. See CYCLAMEN.

SOWER, CHRISTOPHER, 1693-1758; b. Germany; a printer; came to this country and published, 1738, the first quarterly in a foreign language ever issued in Pennsylvania. He was the first to manufacture type and printer's ink in this country, and printed a quarto Bible in German in 1743. His son CHRISTOPHER, 1721-84, who emigrated with him, succeeded his father in the book-making business, and invented cast-iron stoves. During the revolution he was called *Das Brod-Vater*, the bread-father, on account of his liberal distribution of provisions to the destitute, but, joining the loyalists, his estates were confiscated.

SOWERBY, GEORGE BRETINGHAM, b. England, 1812. He published a number of books on conchology and kindred subjects, illustrated by himself, of which *Thesaurus Conchiliorum* is the most extensive. He d. 1884.

SOWERBY, JAMES, 1757-1822; b. England; began life as a teacher of drawing and painter of miniature portraits; became a botanist and mineralogist of distinction, and published seven works on those sciences, illustrated by himself; among them *English Botany, or, Colored Figures of all the Plants Natives of Great Britain*, and *British Mineralogy*.

SOWERBY BRIDGE, a small manufacturing t. in the West Riding of Yorkshire, 3 m. s.w. of Halifax. It contains iron-works, maling-houses, corn-mills, worsted and cotton factories, chemical works, and dye-works; but the woolen manufacture is the principal branch of industry. Pop. '91, 10,409.

SOW THISTLE, *Sonchus*, a genus of plants of the natural order *composita*, suborder *cichoracea*, having an imbricated involucre, swollen at the base, with two rows of unequal scales, which at length bend inward; a naked receptacle; the fruit transversely wrinkled and without a beak, the pappus hairy and without a stalk. The COMMON SOW

THISTLE (*S. oleraceus*) abounds in Britain and in most parts of Europe, as a weed in gardens and cultivated fields. It is an annual plant, delighting in rich soils, grows to the height of two or three ft., with somewhat branching stem, and small yellow flowers almost in umbels. The tender tops and leaves are much used in the north of Europe as greens.—The **CORN SOW THISTLE** (*S. arvensis*) is a perennial with large yellow flowers, frequent in corn fields in Britain, and throughout great part of Europe.—Nearly allied to the genus *Sonchus* is *Mulgedium*, to which belongs the **ALPINE BLUE SOW THISTLE** (*M. alpinum*), the beautiful blue flowers of which adorn some of the most inaccessible spots of the mountains of Switzerland and of Scotland.

SOY is a thick and piquant sauce, made from the seeds of the **SOY BEAN** (*Soja hispida*), a plant of the natural order *leguminosæ*, suborder *papilionaceæ*, so nearly allied to the genus *dolichos* (q.v.) as to be often included in it. It is a native of China, Japan, and the Moluccas, and is much cultivated in China and Japan. It is also common in India, although, probably, not a native of that country. The seeds resemble those of the kidney bean, and are used in the same way. The Japanese prepare from them a substance called *miso*, which they use as butter.

Soy is made by mixing the beans softened by boiling with an equal quantity of wheat or barley roughly ground. The mixture is covered up, and kept for 24 hours in a warm place to ferment. The mass is then put into a pot, and covered with salt, the salt used being in quantity about equal to each of the other ingredients. Water is poured over it; and it is stirred, at least once a day, for two months, after which the liquor is poured off and squeezed from the mass, filtered, and preserved in wooden vessels. By long keeping, it becomes brighter and clearer. A Chinese sauce, called *kitjap* (ketchup), is often sold in Britain as soy, but is very inferior to the true soy.

SOYER, ALEXIS, a famous French cook, was born in 1809; was chief cook at the Reform Club, London, from 1837 to 1850, and died in England in 1858. During the Crimean war he visited Constantinople and made valuable reforms in the system of army cooking. He published several books on his specialty, among them, *Cookery for the People* (1845); *Gastronomic Regenerator* (1847); and *The Modern Housewife* (1849).

SPA, a t. of Belgium, and a watering-place of world-wide celebrity, stands in a romantic valley amid hills which form part of the Ardennes chain, 17 m. s.e. of Liège, and 22 m. s.w. of Aix-la-Chapelle by railway. The prettily-built town consists almost entirely of inns and lodging-houses. The chief edifices are the *Redoute*—plain outside, but handsome within, and including under one roof a theater (open four times a week), a ball-room, etc.—and the *Vauxhall*, a second Redoute, but now little used. Gaming, which figured prominently among the amusements, was suppressed in 1872. The mineral springs, seven in number, are all chalybeate, and contain minute quantities of iron, so combined with alkaline salts and carbonic acid gas as to be both easily digested and agreeable to the palate. They are cold, bright, and sparkling, and are efficacious in complaints of the liver, nervous diseases, etc. The principal and strongest spring, the *Pontcon*, is situated within the town. Fifteen other springs are near the town, and most of them are situated amid picturesque plantations. Spa is also famed for the manufacture of wooden toys, which are stained brown by being steeped in the mineral waters. Pop. '94, 8135. The number of visitors during the season is about 12,000, largely from England. Spa was frequented as a watering-place as early as the 14th c., and has given its name to many mineral springs.

SPACCAFORNO, a city of Sicily, in the province of Syracuse, with '81, 8588 inhabitants. Opposite Spaccaforno, Roger, king of Sicily, gained a signal victory over the Saracens in 1092.

SPACE AND TIME. Space and Time being the most general conditions, forms, or attributes of all existing things, their discussion is linked with the highest problems of philosophy. Space is co-extensive with, and inseparable from, the sensible, external, or object world; time is a property both of the object world and of the subject mind.

Of the so-called innate ideas maintained by one school of philosophy, Space and Time are the foremost examples. (Other examples are number, infinity, being, substance, power, personal identity, etc.) Accordingly, it is held, on the one side, that these notions are underived, or intuitive to the mind; and, on the other side, that they arise in the course of our education or experience, like our ideas of heat, sound, color, gravity, etc.

To begin with space. The supporters of the innate or intuitive origin of the idea allow that it does not arise in the mind until actual objects, or extended things, are presented to the senses—until we see the visible, and touch the tangible things around us; but they declare that this contact with the sensible world is only the *occasion* of our becoming conscious of what was already in the mind. Thus, Mr. Mansel says: "Space is not properly an *innate idea*, for no idea is wholly innate; but it is the innate element of the ideas of sense which experience calls into consciousness." It is, in short, the superadding of some independent activity of the mind to the passive sensation. The reasons usually given for assuming an intuitive element in the idea of space are, in the main, the reasons given for innate ideas generally; they chiefly resolve themselves into affirming

the attributes of *universality* and *necessity* in such ideas ; and the inadequacy of mere sensible experience to reveal these high attributes of things. Whatever is got by experience can be thought away ; space and time cannot. Thus, it is impossible for us to receive any sensible impression of an outward object—the sun, for example—without conceiving that thing as existing in space. To use the language of Kant, space is a form of our sensibility, or sensible perception ; and as the perception itself cannot, he thinks, give this universal and inseparable form—it must be contributed by the mind. Sir W. Hamilton supposes that we may have an “empirical” notion of space—i.e., a notion from experience ; but that space as a “form” is not obtained from experience, but from intuition. He does not, however, explain clearly wherein consists the difference between these two notions.

According to the opposite view space is an abstraction from our experience of extended things, exactly as gravity is an abstraction from gravitating bodies, and justice from just actions. We first obtain from experience a variety of impressions, in the concrete, of things possessing extension ; and, next, from all these, by the usual process of abstraction, we gain a notion of extension in the abstract, or space. A few remarks may be made on these two distinct operations, as both involve matters of controversy.

1. Before the muscular feelings were distinctly recognized as something superadded to the proper sensations of the senses—or the feelings of mere light, sound, etc., it was not easy to show that, by sensible experience alone, we could perceive objects as extended, or as occupying space. The pure optical sensibility of the eye is for color solely ; the pure tactile sensibility is for softness and smartness, roughness and smoothness, etc. When, however, we make full allowance for the whole range of feeling connected with the exercise of muscular energy, there is no difficulty in accounting for the origin of such notions as resistance (force or power) and extended magnitude. The element supposed by the *à priori* philosophers to be contributed by the mind itself, is according to the other school, muscularity, or the feeling of the putting forth of inward energy. The two senses related to our cognizance of space—sight and touch, are compound senses ; they involve an active energy, with its peculiar consciousness, as well as a passive sensibility ; and all that is characteristic of extension or space arises through these muscular accompaniments.

2. Having perceived a great number of things as extended, with the intervals of unoccupied extension that separate these, we form an idea of extension in the abstract. The distinguishing peculiarity of this abstraction is related to *unoccupied* extension, or empty space, where we seem to have extension without anything extended ; rendering the idea of space unlike other abstract ideas, as gravity, or justice, which are conceivable only as embodied in gravitating things, or just actions. Still, empty space is a reality to us, inasmuch as it expresses cessation of resistance, and free scope for movement. To the senses alone, without the muscular accompaniments, space would be a nonentity ; an inconceivability ; but the feeling of the sweep of the arm, or of the locomotion of the body, in passing from one point of resistance to another is a genuine mental experience—the filling up of the interval between two tactile encounters, or between two optical pictures, with conscious activity.

The idea of TIME, continuance, or endurance, applies both to our feelings of energy put forth, and also to our sensations, emotions, and the flow of our ideas ; in other words, it attaches both to the extended or object world, and to the unextended or subject mind. In our muscular feelings, which represent the universe of matter and space, we discriminate a dead strain, or effort of resistance, lasting a short time from the same strain lasting a longer time ; and also a more persisting movement from a less. So in the sensations ; a sound enduring a second is different to us from a sound enduring two seconds ; a transitory odor is not confounded with one of greater continuance. We distinguish two bursts of wonder, terror, love, or anger, if they have been unequal in their duration. Abstracting from all these experiences of continuance in the concrete, we obtain the idea of time ; which idea, however, like other abstractions, must be conceived by us under some individual continuing thing. If we were to imagine the whole outward universe annihilated, we should still have, in our own consciousness, an instance of the continuing, and upon that we could sustain the conception of time. See GENERALIZATION.

Time is measured by space, and space by time. The one is often expressed by the other, but with a certain limitation ; we say “a space of time,” but not “a time of space.” Movement is common to both. Of passive sensations, the best for indicating time are those of hearing.

SPACE, a term in music used to describe any note situated on an enclosure between the lines of the stave. The stave is made up of five lines and four spaces.

SPADE-HUSBANDRY, COTTAGE-FARMING, and FIELD-GARDENING, are phrases of synonymous meaning, and denote the cultivation of farm-crops on a small scale by means of the spade. This system has long been in operation in Belgium and Flanders, where the holdings average little more than five, though a few are as large as forty acres ; and by steady industry and economy, even the smallest of them is capable of maintaining a family in comfort. In Great Britain, cottage-farming is chiefly practiced among the miners in Cornwall, who at first received leases of their coarse unreclaimed land at 2s.6d.

—5s. per acre, the lease to last for three lives. These patches of from three to five acres number over 6,000, and have increased greatly in value. In Orkney and Shetland, some of Sutherlandshire, and much of the Western isles of Inverness and Argyleshire, spade-culture is quite common, and when properly done is a thorough means of cultivation. In Lincolnshire, especially on the isle of Axholme, the same system exists. The success of small-farming depends on two causes—the inexpensiveness of the stocking and implements, and the superior fertility of the soil when dug. The implements required are—spades and digging-forks of different sizes, hoes, rakes, scythe, reaping-hooks, flail, hay-fork, wheel-barrow, and a few other implements equally inexpensive; the steading consists of the cottage, a cow-shed (for one or two cows), and a pig-sty; the stock, of cows, pigs, and poultry, besides household furniture. The superiority of the spade over the plow rests on its deeper cultivation; on its not forming a hard impermeable crust on the surface of the subsoil, as the plow does; on its more thorough subdivision of the soil; and on its more effective burying of weeds. Besides the treading of the land by the horses' feet is avoided.

SPADA, LEONELLO, b. Bologna, 1576; d. Parma, 1622; an Italian painter, a student of the Carracci and of Caravaggio. His principal works were executed at Reggio, Modena, and Parma, and the principal one is "San Domenico burning the proscribed Books of the Heretics."

SPADIX. See **SPATHE**.

SPAGHETTI. (Italian). The name of the smaller and more delicate kind of macaroni (q.v.), one size larger than vermicelli (q.v.).

SPAGNOLET TO. See **RIBERA**.

SPAHIS (the same with *Sipahi*, or Sepoy q.v.) were the cavaliers furnished by the holders of military fiefs to the Turkish army, and formed the *élite* of its cavalry. The spahis, along with the Janizaries (q.v.) owe their organization primarily to Orchan, the second of the Ottoman sultans, finally to sultan Amurath I.; and when levied *en masse*, could number 140,000, but such a levy was very seldom called for. In the field, they were divided into two classes, distinguished by the color (red and yellow) of their standards; one class had pistols and carbine, the other a bow and arrows, and both carried a saber, lance, and *jerid*, or javelin. They were excellent irregular troops; but when European organization was introduced into the Turkish army, they were replaced (1826) by regular horse. At the present time, the French have numerous regiments of spahis, raised from among the native tribes of Algeria and from France in about equal proportions; the dress, especially of the indigenous soldiers, partakes very much of the Arab character. The natives are allowed to rise to any grade below that of capt.; but all the superior officers are of French descent. See **ZOUAVES**.

SPAIGHT, RICHARD DOBBS, about 1758–1802; b. New Berne, N. C.; educated at Glasgow university; returned to North Carolina shortly before the revolution, and fought on the American side. He was a member of congress, 1782–83, and 1798–1801, and of the constitutional convention of 1787. From 1782 to 1785 he was the governor of North Carolina. Spaight was killed in a duel with one John Stanly.

SPAIGHT, RICHARD DOBBS, JR., was born at New Berne, N. C., in 1796; was educated at the University of North Carolina, where he graduated in 1815; became a lawyer, and in 1819 was elected to the state assembly. He was a member of the state senate, 1820–22, and of congress, 1823–25. He was again a state senator in 1825–34; in 1835 was elected a member of the state constitutional convention, and also governor of the state, serving two years. He died at New Berne in 1850.

SPAIN (Span. *España*), a kingdom of Europe, occupying the larger portion of the great peninsula which forms the s.w. corner of the European continent, reaching further s. than any other European country, and further w. than any except Portugal. It is bounded on the n. by the bay of Biscay and by France, from which it is separated by the mountain ridge of the Pyrenees; on the e. and s. by the Mediterranean and Atlantic; and on the w. by the Atlantic and Portugal. Greatest length, from Fuenterrabia on the n. to Tarifa on the s. 560 m.; greatest breadth, from cape Finisterre (Land's End), the extreme point on the w., to cape Creuze, the extreme point on the e., about 650 miles; average breadth about 380 miles. Area, including the Balearic (q.v.) and Canary isles, 195,738 sq.m.; pop. '87, 17,550,246. The country, including the Balearic and Canary isles, was divided in 1834 into 49 modern provinces, though the former division, into 14 kingdoms, states, or provinces, is still sometimes used. The following is a table of the ancient states, and of the modern provinces into which they have been divided, with their areas and populations, according to the most recently published estimates—those of 1887—and in the same year, Great Britain and Germany acknowledged her right to the protectorate of the Caroline Islands (q.v.), which have an area of 560 sq. miles and a population of 36,000 souls. This gives to Spain in Asia colonial possessions with an area of 116,256 sq.m. and a population of 9,619,665. In 1885 the sovereignty of Spain was extended over the Sulu islands (q.v.); area, 950 sq.m.; pop. 75,000.

Colonies.—The colonies of Spain cover an area of 405,338 sq. miles, with a population, in '87, of 9,695,567. In point of population, the Spanish possessions in Asia are the largest. They include the Philippine islands, Sulu islands, Caroline islands and Palaos, and Marianne islands, with a population of over 7,000,000. In Africa the Spanish possessions are Rio de Oro and Adrar, Ifni, Fernando Po, Annabon, Corisco, Elobey, and San Juan. The Canary islands are reckoned administratively as a part of Spain. In America, Spain has Cuba and Porto Rico.

Coast-line.—The entire perimeter of the country is 2,080 English m., and the coast-line, exclusive of windings, is 1317 m. long, of which 712 m. are formed by the Mediterranean, and 605 m. by the Atlantic. The n. coast, from Fuenterabia w. to cape Ortegal, is unbroken by any considerable indentation. A wall of rocks, varying in height from 30 to 300 ft., runs along this shore; but the water, which contains considerable depth close to the beach, is not interrupted to any unusual extent by islands or rock. The n.w. coast, from cape Ortegal s. to the mouth of the river Minho—which separates the Spanish province of Galicia from Portugal—though rock-bound, is less elevated, and is much more broken than the shores washed by the bay of Biscay; and the indentations, the chief of which are Noya Arosa and Vigo bays, form secure and spacious harbors. From the mouth of the Guadiana, on the s., to the strait of Gibraltar, the coast-line, though well-defined, is low, sandy, and occasionally swampy. From Gibraltar to cape Palos the shores, which are backed in part by the mountain-range of the Sierra Nevada, are rocky and high (though flats occur at intervals), are unbroken by indentations, and comprise only two harbors, those of Cartagena and Malaga. A low, and for the most part sandy, coast extends n. from cape Palos, rising into rocky cliffs and bluffs in the vicinity of Denia, but extending in sandy flats from Denia to the mouth of the Ebro. From the mouth of this river, n. to the frontier of France, the coast is alternately high and low, and its principal harbors are Barcelona and Rosas.

Surface and Hydrography.—The compactness and the isolation of this country, and its position between two seas, the most famous, and commercially the most important in the world, are not more in its favor than the character of its surface, which is more diversified than that of any other country in Europe of equal extent. An immense plateau, the loftiest in the continent, occupies the central regions of Spain, and is bounded on the n. and w. by mountainous tracts, and on the n.e. by the valley of the Ebro; on the e. by tracts of land frequently low, but in some parts traversed by hill-ranges; on the s. by the valley of the Guadalquivir, which intervenes between it and the Sierra Nevada (q.v.). This great plateau rises to the height of from 2,000 to 3,000 ft., and occupies upward of 90,000 sq. m., or about half of the entire area of the country. The whole of the Pyrenean peninsula is divided by Spanish geographers into 7 mountain ranges, of which the chief are: 1. The Cantabrian mountains (q.v.) and the Pyrenees (q.v.), forming the most northern range; 2. The Sierra de Guadarrama, separating Leon and Old Castile from Estremadura and New Castile, and rising in the peak of Penalara 7,764 ft. above sea-level; 3. The Montes de Toledo, forming a part of the watershed between the Tagus and the Guadiana; 4. The Sierra Morena (q.v.), between the upper waters of the Guadiana and Guadalquivir; 5. The Sierra Nevada (q.v.), running parallel with the shores of the Mediterranean, through southern Murcia and Andalusia, and rising in its chief summits to loftier elevations than are found in any mountain-system of Europe, except that of the Alps. The several mountain-ridges, or as they are called, *Cordilleras* of Spain, have a general e. and w. direction, and between them run, in the same direction, the nearly parallel valleys or basins of the great rivers of the country, the Douro, Tagus, Guadiana, and Gaudalquivir, each of which is described in its proper place.

Climate and Soil.—The climate of Spain, owing to the extent and configuration of the country, is exceedingly various. In the n.w. (maritime) provinces, it is damp and rainy during the greater part of the year; at Madrid, which is situated about 11° s. of London, and only 5° n. of the shores of Africa, winters have occurred of such severity, that sentinels, while on duty, have been frozen to death; while the s. and e. provinces are warm in winter, and are exposed to burning winds from the s., and to an almost tropical heat in summer. Both ancient and modern geographers have adopted difference of climate as the rule for dividing the peninsula into tracts distinct as well in soil and vegetation as in temperature. Of these tracts or zones the first and most northern may be considered as embracing Galicia, Asturias, the Basque provinces, Navarre, Catalonia, and the northern districts of Old Castile and Aragon. In this tract the winters are long, and the springs and autumns rainy, while n. and n.e. winds blow cold from the snow-covered Pyrenees. The country, which alternates with hill and dale, is plentifully watered by streams rich in fish, and meadows yielding rich pasturage abound. Corn scarcely ripens in the more exposed districts, but grain crops of all kinds are produced in others, as well as cider, wine, and valuable timber. The middle zone is formed mainly by the great central plateau, and embraces northern Valencia, New Castile, Leon, and Estremadura, with the s. parts of Old Castile and Aragon. The climate of the great part of this region is pleasant only in spring and autumn. Throughout the chilly winter, the treeless table-lands are over-swept by violent tempests, and in summer are burned up by the sun. The soil is generally fertile, and corn and wine are most abundantly produced. The southern or Bætic zone, comprising the rich country that extends between the southern wall of the central plateau and the Mediterranean shores, includes Andalusia, Murcia, and southern Valencia. The stony rampart on the n. protects it from the chilly winds of the central zone; but it is unprotected against the hot winds (the *Solana*, see *SIMOON*) which in summer blow n. from Africa, and render this season intolerable to northern Europeans. Here the winter is temperate, and the spring and autumn delightful beyond description. The descent from the cold and mountainous central regions to this tract of tropical heat and fertility affords a most striking contrast. The soil, which is artificially irrigated, is well adapted to agriculture and the cultivation of heat-loving fruits. The products comprise sugar, cotton, and rice, and the orange, lemon, and date.

Material Revival of Spain; Population; and Distribution of Land.—Owing to a number of causes, Spain, at one time the most opulent kingdom in Europe, had in the 18th c. lapsed into a state of complete stagnation; the spirit of enterprise seemed extinct, and ease and squalor to be preferred to labor and affluence. Before the commencement of the present century, however, the country began to throw off its lethargy, and since that time the rate at which it has been advancing toward a healthy condition of active life has become gradually accelerated. Since 1851 the onward movement of the nation has been as rapid as that of any of the great European powers. The population has greatly increased, and is increasing; agriculture, previously stagnant, is now carried on with activity and success; manufactures are multiplying rapidly; and railways, of which in the beginning of 1848, not a mile had been constructed, are now in process of being laid out between all the great centers of population—7543 m. having been completed in 1894. A view of the increase of the population, the first basis of power, will afford an index of the growing prosperity of the country. The estimates of the population of Spain for various periods between the beginning of the 16th c. and the middle of the 18th c. vary considerably; but it is certain that there was a gradual decrease of from

2,000,000 to 3,000,000 of inhabitants between the years 1500 and 1700. With regard to later times, we have the following authentic statement:

Year.	Population.
1763.....	9,159,999
1797.....	10,541,221
1857.....	15,464,340
1860.....	15,673,536
1870.....	16,835,506
1887.....	17,550,246

It thus appears that in about a century the population of Spain has increased over 8,000,000. Comparing the census of Dec., 1877, with that of Dec., 1887, we find that the provinces in which the population has most largely increased are Madrid, Barcelona, Tarragona, Murcia, Cadiz, Valencia, Biscay, Avila, Salamanca, Jaen, and Valladolid. These are for the most part maritime provinces, or such as, from their vicinity to the coast, have facilities for communication with the sea; and, this being the case, it may be fairly argued that the rapid extension of the railway system now going on, will—besides acting favorably on the whole kingdom—have a specially beneficial effect upon the interior provinces. In agriculture as well as in population, the onward movement has been remarkable. The vast mountains of the country affording for the most part only scanty crops of herbage, are utilized as pasture-grounds, and are divided into large farms. But in the warm and fertile plains, especially in localities where water is abundant, the farms are small. About 80 per cent. of the soil is productive. Wheat, barley, maize, rye, and potatoes are extensively raised.

Origin of the People.—The Spaniards are a mixed race, and have sprung from a greater variety of stocks than any other European nation. The bulk of the people is doubtless descended in the main from the ancient Celtiberian occupants of the peninsula. At an early time, however, there were extensive Phenician and Carthaginian settlements in Spain, especially on the eastern sea-board. Later, the country was penetrated with Roman elements, and was Romanized throughout, save in the Basque (q.v.) country, where the ancient speech still lives on intact. Gothic invasions left a large Germanic strain in the blood of Spain, which may yet be plainly traced in the hill-country of the n.e. The Arab conquerors of Spain planted themselves too firmly on Spanish soil to be utterly expelled; and the Moriscoes (see Moors) are still, to the number of 60,000, easily distinguishable by their tongue and other peculiarities. In the s. and center Gypsies (*Gitanos*) are numerous, and there are some Jews. One result of this commingling of races may be seen in the strongly marked provincial peculiarities of Spain, extending not merely to dialectal differences, but to physique, character, and amusements. The Castilian is the literary language of Spain; the Andalusian diverges somewhat broadly from it; in Catalonia, Valencia, and on the Balearic isles, the prevailing dialect is closely allied to Provençal; while in the Basque provinces the old tongue is still in universal use among the people. Until lately (see *FUEROS*), the Basques enjoyed quite peculiar privileges as to local government and administration. In spite of great local differences of character, the Spaniard is generally temperate, and his few wants are easily satisfied. He requires a daily siesta, is not very energetic by nature, loves music, dancing, and the bull-fight, and is not averse to intrigue and the use of weapons. Even amid poverty and squalor, native dignity never forsakes him. The houses are generally poorly furnished and uncomfortable, and often far from cleanly. See *SPANISH LANGUAGE*.

Religion.—Until 1876 the Roman Catholic faith, to which almost all the nation adheres, was the only creed tolerated by law, but the constitution of that year contains a clause allowing liberty of private worship to Protestants, although the constitution declared at the same time that the worship and ministers of the Roman Catholic faith are to be maintained by the nation. Before the suppression of the monasteries in 1836, about one-fifth of the whole nation was engaged in the service of the church.

Education.—The population of Spain contains a large number of illiterates, although the proportion has apparently decreased since 1860. In 1889 about 28.5% of the total population could read and write. There was an extensive scheme for promoting education outlined in 1857. By a law passed in that year, education was to be compulsory, and there was to be a primary school for every 500 inhabitants, but the plan has not been effectively carried out. Compulsory attendance has not been enforced, and the poor pay received by the teachers has rendered instruction inefficient. There are ten universities, attended by about 16,000 students.

Production and Commerce.—Nearly four-fifths of the soil of Spain is classed as productive, and of this about one-third is devoted to the raising of agricultural products and vegetables. The principal crops are wheat, rye, maize, barley, esparto, flax, hemp, and pulse. The wine production is also very important, and fruits, especially oranges, raisins, grapes, nuts, and olives, are exported in large quantities. The agricultural holdings as a rule are small, the number of them having greatly increased during the 19th century. Though the silk industry declined, the silkworm culture is carried on quite extensively in some parts of the country for the purpose of obtaining from the grub, material for a fine strong thread, which, being transparent, is extensively used as snells for fish hooks.

Spain has large mineral resources, including iron, coal, zinc, lead, quicksilver, silver, salt, phosphorus, cobalt and copper. Iron abounds in the provinces of Santander, Vizcaya, Oviedo, Huelva, and Seville, and almost all of it is exported. Silver is found in considerable quantities in the province of Guadalajara and is one of the most im-

portant minerals in respect to the annual value of the output. Gold, along with silver, was one of the metals for which Spain was famous in very remote times, the Phœnicians, and later the Carthaginians, having worked both gold and silver mines in Spain. Pliny the younger refers to the large quantities of gold taken from Galicia, Asturias and Portugal, and, after the fall of the Roman empire, the gold mining industry was carried on with success by the Moors, but the discovery of the precious metals in the New World caused the decline of gold mining in Spain, the Spanish kings forbidding the working of mines in the peninsula in order to promote the industry in America. In recent years, however, the gold resources of a part of Spain have been developed through the efforts of some English prospectors. In the northwestern part of Galicia several gold mines have been developed with increasing success. Iron is one of the most important minerals, being very abundant, but comparatively little interest has been shown in the development of the mines, and, the iron industry being still in its infancy, little of the raw material is required for home consumption. Another important possible source of wealth in Spain which has been neglected is the cultivation of the forests. A great variety of trees are indigenous, and the soil is capable of supporting still others. The leading countries from which Spain imports her goods are England, France, the United States, Germany, Belgium, Italy, Austria, and the Spanish colonies. A very large share of her imports consists of manufactured articles, but, among raw materials, coal, raw cotton and timber are especially heavy items, and food products including fish, wheat, sugar, coffee, cocoa, etc., are also important articles of import. The exports of Spain go chiefly to the Spanish colonies, France, England, Argentine Republic, Uruguay, Mexico, Columbia, Venezuela, and Morocco. The United States, which is one of the leading countries from which Spain imports, falls far below many of the others as a receiver of Spanish goods. The customs policy of Spain is protective. A protective tariff went into effect on Feb. 1, 1892, consisting of a set of lower duties for countries having special treaty stipulations, and a set of higher duties for those without. The principal nations of Europe are entitled to the advantage of lower rates, but the United States, not having trade reciprocity, is required to pay high duties. This fact, combined with the different policy of American traders from that pursued by the European dealers, has retarded the development of commerce between the United States and Spain. As in the case of American trade with other foreign countries, too much dependence has been placed by the American exporter on correspondence and trade catalogues, and too little on direct personal communication with the Spanish market by means of agents, the latter policy being generally pursued by the more successful commercial rivals of the United States. Special causes which operated to the detriment of Spanish trade in 1895 and 1896 were the Cuban war and the revolt in the Philippine islands.

Steamship lines connect Spain with all parts of the world, but her internal facilities for transportation have not proved sufficient to develop her resources, in spite of the fact that they have greatly increased since the first railway was opened in 1848. On Jan. 1st, 1895, there were 7543 miles of railway open for traffic, and considerable additions to the railway mileage were made in subsequent years.

Spain has nominally a double monetary standard, established by the decree of Oct. 19th, 1868, which provides for the coinage of both silver and gold to be received by the government without limitation, although it is stated in the decree that the silver coins may be refused by private individuals in payment of any amount exceeding 50 pesetas. In 1876 it was enacted that all silver of national production, presented to the director of the treasury for coinage, be accepted at a certain price, but later it was provided that the price paid by the treasury should be governed by the current market price of silver. Moreover, no foreign silver should be taken, unless, in the opinion of the treasury officials, it was needed for circulation. In 1896 the status was free coinage of gold and restricted coinage of silver, the purchase of the latter metal being entirely at the will of the government. From the year 1883 gold disappeared from active circulation, having risen to a premium, and in 1896 the coinage was practically all silver and paper currency, the latter consisting exclusively of notes of the bank of Spain.

The Spanish army consists of three parts, (1) a permanent army; (2) a first or active reserve; and (3) a second or sedentary reserve. There is liability to military service on all Spaniards who have passed the age of 19, but exemption may be purchased for the sum of 1500 pesetas. In 1896 the permanent army consisted of 9,315 officers and 70,829 men, while, on a war footing, it was estimated that the regular army amounted to 183,972. See *ARMIES, MODERN*. The Spanish navy in Dec. 1896 had one battle-ship of the first-class, one port-defence ship, 112 cruisers, and 38 torpedo craft, together with a number of vessels in process of construction. See *NAVIES, MODERN*.

History.—Spain, the *Spania*, *Hispania*, and *Iberia* of the Greeks, and known to the Romans by the same names, was inhabited at the period at which it first receives historical mention, by a people deriving their origin from different races. It is supposed to have been originally inhabited by a distinct race called Iberians; upon whom, however, a host of Celts are supposed to have descended from the Pyrenees. In the earliest times of which we have any record, these two races had already coalesced and formed the mixed nation of the Celtiberians, who were massed chiefly in the centre of the peninsula, in the western districts of Lusitania, and on the n. coasts. In the Pyrenees and along the e. coast, were to be found pure Iberian tribes, while unmixed Celtic tribes occupied the n.w. In Bætica (Andalusia) there was a large admixture of the Phœnician element, and on the s. and e. coasts, numerous Phœnician, Carthaginian, Rhodian, and other colonies. A portion of the s. coast, called Tartessus by the Greeks,

the Tarshish of Scripture, was much frequented for its mineral riches by the Phœnician merchantmen, and the "ships of Tarshish" were as distinct a section of the Tyrian mercantile marine, as were the Spanish galleons of the 16th c., or our own Indiamen of more recent times. But the bond which connected the Iberians and the Phœnicians was purely of a commercial character. About the middle of the 3d c. B.C., the Carthaginian influence began to be much felt in Iberia, and a considerable tract of territory was brought under subjection to Carthage by Hamilcar (q.v.), who founded the city of Barcelona. During the next eight years, the Carthaginian interest was advanced, and its power further strengthened by Hasdrubal (q.v.—died 220 B.C.), son-in-law of Hamilcar who founded Carthago Nova (the modern Cartagena) and concluded a treaty with the Romans whereby it was stipulated that he should not advance his standards n. of the Iberus (Ebro). Hannibal (q.v.), son of Hamilcar, and the greatest of all the Carthaginian generals, now assumed the command in the peninsula. He attacked and destroyed Saguntum (q.v.), and thus violated the treaty made between his father and the Romans. The destruction of Saguntum was the cause of the Second Punic War, for the principal incidents of which see CARTHAGE, ROME, HANNIBAL, and the SCIPIOS. After the Romans had driven the Carthaginians from the peninsula in 206 B.C., the country was erected into a Roman province, consisting of two political divisions—*Hispania Citerior* (Hither Spain) including the eastern and northern districts or those nearest to the center of the Roman Empire; and *Hispania Ulterior* (Further Spain) including the districts furthest from Rome, or the southern and western districts. It was not, however, till 25 B.C. that the Cantabri and Astures in the extreme north of the country, laid down their arms to Augustus. After the country had been reduced to subjection, it was divided into the three provinces of Tarraconensis (embracing the northern and eastern provinces), Bætica (Andalusia), and Lusitania (Portugal and certain of the western provinces). This division of the country lasted till the reign of Constantine the great (q.v.), (306–37). From the time of the complete supremacy of the Romans till the death of Constantine, the condition of Spain was eminently prosperous. The inhabitants, when brought under the iron rule of the empire, were forced for the time to desist from the intestine wars in which it had been their habit to indulge, and adopting the language, laws, and manners of their conquerors, they devoted themselves to industrial pursuits, and increased remarkably both in wealth and in numbers. Everywhere throughout the country, towns of a purely Roman character sprang up, among the chief of which were Leon, Emerita Augusta (Merida), Pax Julia (Beja), Cesar Augusta (Zaragoza); and numerous aqueducts, bridges, amphitheatres, etc., were built, the ruins of which are the wonder of the modern traveler. Spain, though obtained at enormous cost both in treasure and human life, was for three centuries the richest province of the Roman Empire. Its fertile fields formed for a considerable time the granary of Rome, and from its metal-veined sierras, an immense amount of treasure in gold, silver, etc., flowed into the Roman coffers. "Twenty thousand pound-weight of gold," says Gibbon, "was annually received from the provinces of Austria (Asturias), Galicia, and Lusitania." This amount of wealth was not the voluntary offering of the natives, who were compelled to labor in their mines for the benefit of strangers; and thus Spain, in the early ages, was the type of Spanish America in the 15th and succeeding centuries, with the single difference that in the first case the Spaniards were the slaves, and in the second they were the slave-holders. In 409 A.D., hordes of barbarians, Alans, Vandals, and Suevi, crossed the Pyrenees and swept over and desolated the peninsula—the Vandals for the most part settling in Bætica, the Alans in Lusitania, and the Suevi in Leon and Castile. About 412, the Visigoths invaded the country, and their king, Athaulf, who acknowledged a nominal dependence on the Roman emperor, established the Gothic monarchy in Catalonia. See GOTHS. Of the Visigoths—by whom the Suevi were subjugated (584), the Vandals and Alans expelled (427) from the country, and large portions of Gaul annexed to their Spanish dominion—the most remarkable kings were Wallia (415–18), who greatly extended the Gothic monarchy; Euric (466–83), who, besides increasing his territory, introduced and enforced a body of laws, and did much for the advancement of civilization in Spain; Wamba (673–80), who built a fleet for the protection of the coasts; and Roderic (q.v.), who was killed at Xeres de la Frontera in 711, in battle with the Moors. The battle of Xeres gave the Moors almost undisputed mastery of nearly the whole of Spain, as well as of the outlying Gothic province of Septimania (Languedoc) in France; for the remnant of the Goths betook themselves to the highlands of Asturias, Burgos, and Biscay, where, in a region which throughout had enjoyed more liberty than any other part of Spain, they maintained their independence.

Dynasty of the Moors.—The Arabs, or, as they are more properly termed, the Moors (q.v.), held Spain for the first few years of their rule, as a dependency of the province of n. Africa; but, after the downfall of Muza (q.v.), and his son Abd-el-aziz, who had been the deputy-governor of Spain, the country was governed (717) by *emirs* appointed by the caliph of Damascus. The favorite scheme pursued by the Spanish emirs was the extension of their conquests into Gaul, to the neglect of the rising power of the Goths in Asturias; they also took the Balearic islands, Sardinia, Corsica, and part of Apulia and Calabria; the Mediterranean was infested by their fleets, but their northward progress was most signally checked on the plain of Tours by Charles Martel (q.v.). Anarchy and bloodshed were prominent features of the first 40 years of Mohammedan rule in Spain. The *walis*, or local governors of districts and provinces, frequently rebelled against the

emir, and drew sword against each other according as ambition or animosity dictated. Within this period of 40 years, no fewer than 20 emirs had been called to the direction of affairs; but a revolution at Damascus, which unseated the Ommiades, and placed the Abbasides in possession of the caliphate, put an end to this state of misrule in Spain. The last of the *emirs*, Jussuf, was in favor of the Abbasides, but the *walis* and *alcaydes* being chiefly of the Ommiade faction, invited one of this family, who was in concealment among the Zeneta Arabs in Barbary, to become an independent caliph in Spain. See OMMIADES. Thus was founded the *caliphate of Cordova*, from which, in 778, the Franks wrested all its possessions n. of the Pyrenees, and north-eastern Spain to the Ebro; the latter acquisition, subsequently denominated the *Spanish March*, being alternately in the hands of the Moors and dependent upon France.

Christian Kingdoms.—During this period of Moorish domination, the small independent kingdom of Asturias, founded by Pelayo (q.v.), had been growing in power and extent. It was increased by Galicia in 758, and by parts of Leon and Castile toward the close of the century. In 758 a second independent Christian kingdom was founded in Sobrarve, and increased by portions of Navarre on one hand and Aragon on the other, but though it, along with the French Gascons, aided the Moors at Roncesvalles (q.v.), it was, in 801, again swallowed up by the caliphate of Cordova. However, 36 years afterward a Navarrese count, casting off his allegiance to France, founded the third Christian kingdom, that of Navarre (q.v.), which from this time easily maintained itself, owing to its situation, in independence of the Moors. The kingdom of Asturias, now (900) Leon, was for a long time distracted by bitter and bloody strife among the members of the royal line, and with its neighbor Navarre would have fallen an easy prey to the powerful Ommiades, had not the latter directed their chief attention to the subjugation of Morocco; and under cover of this relaxation of the constant warfare between Moors and Christians, another independent monarchy, an offshoot from Leon, was founded in Castile (933, kingdom in 1035), which, from its central position, and consequent greater facilities for expansion, soon became the most powerful of the Spanish states, especially after its union (temporary, 1072–1157), in 1230, with Leon. A considerable part of Aragon had been wrested from the Moors by Sancho III. (1000–35) of Navarre, and at his death this part of his dominions passed by inheritance to his son Ramiro, who added to it the districts of Sobrarve and Ribagorza, and a considerable extent of country which he conquered from the common enemy, the Moors. This kingdom of Aragon was the last Christian kingdom formed in Spain; and though it increased by acquisitions from the Moors, yet being limited by Leon, Castile, and Navarre on one side, and the Spanish March (now only the county of Catalonia or Barcelona) on the other, its princes aimed at maritime power; and by the union, through the marriage of the count of Barcelona with queen Petronilla, of the Spanish March with Aragon, means were obtained of carrying out this policy, and the spread of the Aragonese dominion to Sicily (q.v.), Naples (q.v.), and other regions bordering on the Mediterranean, was the consequence. These three kingdoms—Castile and Leon, Navarre, and Aragon—continued, sometimes in combination and sometimes separately, to war against their common enemy, the Moors—Castile being, from its greater power and proximity, the most persistent assailant, and Navarre, for the opposite reason, the least so; but whenever the arrival of fresh levies from Africa, or the accession of an energetic caliph threatened serious danger to any one of the three, the others generally came to its aid.

The extinction of the Ommiades in Spain in 1031, and the disruption of the caliphate into the minor kingdoms of Cordova, Seville, Toledo, Lisbon, Zaragoza, Tortosa, Valencia, Murcia, Badajos, and seven others of less note, was an occurrence by which the kings of Castile and Aragon did not fail to benefit, for by well-directed and unremitting attacks they subdued some, rendered others tributary, the kings of Portugal also on their side gallantly and successfully pursuing the same policy; and a few years more would have certainly annihilated Moorish domination in Spain, had not Mohammed of Cordova and Seville, hard pressed by Alfonso VI. of Leon and Castile, about the close of the 11th c., applied for aid to an Arab tribe, whose military career in n. Africa had been of the most brilliant character. This tribe, the Almoravides—i.e., men devoted to the service of God—had made themselves masters of the provinces of Africa and Almagreb, and founded the empire of Morocco. Responding to the request of Mohammed, the Almoravides crossed over to Spain, defeated the king of Aragon and Castile, and recovered much of New Castile. Then, turning upon their ally Mohammed, they compelled him to yield up the provinces of Cordova and Seville, and all the minor Moorish princes to follow his example; so that, in 1094, the Almoravide sovereign was acknowledged sole monarch of Mohammedan Spain. The power of this tribe, however, began to decline about 1130, and was extinguished by the Almohades (q.v.), a fanatical sect of Mohammedans, who landed in Spain in the middle of the 12th c., and conquered the territories of the Mohammedans in Spain. During the reign of the third monarch of this dynasty took place the battle between the combined forces of Castile, Leon, Navarre, Aragon, and Portugal, with the Moors, in which the former gained the most celebrated victory ever obtained by the Christians over their Moslem foes, the latter losing, according to the account transmitted to the pope, 100,000 killed and 50,000 prisoners. This sanguinary conflict, fought on the plains of Tolosa (*las navas de Tolosa*), July 16, 1212, broke the Almohade power in Spain, as that of Salamanca (July 22, 1812), almost exactly six centuries afterward, did the more formidable strength of Napoleon. On the fall of the Almohades, Mohammed-ben-Alhamar, the king of Jaen, rose to the first place among

the Mohammedan princes, and founded (1238) the *kingdom of Granada*. The king of Granada was speedily forced to become a vassal of Castile, and from this period all danger from Moslem power was over. The rest of the history of the Spanish kingdoms before their union is undeserving of a detailed account. The Castilian court was the scene of almost constant domestic strifes and rebellions, varied with a campaign against Granada or in favor of the monarch of that kingdom against his rebellious vassals; the only prominent monarchs of this kingdom being Ferdinand III., who confined the Moorish dominion to the s. of Andalusia, Alfonso X. (q.v.), Alfonso XI., Peter the Cruel (q.v.), and queen Isabella, the last sovereign of Castile, who succeeded her brother Henry IV., owing to a widespread belief in the illegitimacy of the latter's daughter. Aragon, on the other hand, was almost wholly free from intestine dissensions, doubtless owing to the interest taken by the Aragonese monarchs in Italian politics; of these sovereigns Jayme I. (1213-48) conquered Valencia and Majorca, and, first of all the Aragonese kings, received a voluntary oath of allegiance from his subjects; Pedro III. (1248-85), who obtained Sicily (1282), Minorca, and Iviza; Jayme II., who conquered Sardinia and Corsica; Alfonso V. (1416-68), who conquered Naples; and Ferdinand II. (q.v.), the Catholic, the last sovereign of Aragon, who, by marriage with Isabella, queen of Castile, in 1469, the conquest of Granada in 1492, and that of Navarre in 1512, united the whole of Spain (and French Navarre) under one rule.

The year 1492, in the reign of Ferdinand and Isabella, witnessed also the discovery of America, as well as the capture of Granada. Spain had now become consolidated into one empire, from the Pyrenees to the strait of Gibraltar, civil wars were at an end; and a splendid continent, teeming with riches, had been opened up for Spanish adventure and enterprise. But, as the most active spirits among the Spaniards now crowded to the new world, the soil of Spain, and its mineral treasures, both inexhaustible sources of wealth, were neglected for the riches of the fancied El Dorado, where, as was everywhere believed, gold was more plentiful than iron was in the old country. Besides the drain upon the country from emigration, the expulsion of the Jews and Moors was productive of the direst results; and the decline of the splendid Spanish empire, upon which the sun even then never set, may be said to have had its origin in the event which raised the country to the height of its magnificence. Charles I. (Charles V. of Germany, q.v.) succeeded Ferdinand, and in his reign Mexico (q.v.) and Peru (q.v.) were added to the possessions of Spain. Philip II. (q.v.), by his enormous war expenditure and maladministration, laid a sure foundation for the decline of the country. Industry, commerce, and agriculture, may be said to have been extinguished at the expulsion of the Moriscos (see Moors); and the reigns of Philip III. and Philip IV. witnessed a fearful acceleration in the decline of Spain by the contests with the Dutch, and with the German Protestants in the thirty years' war, the intermeddling of Olivarez (q.v.) in the affairs of northern Italy, the rebellion of the Catalans, whom the minister wished to deprive of their liberties, the wars with France, and the rebellion of Portugal (1640), which had been united to Spain by Philip II. That of Charles II. was still more unfortunate, and the death of the latter was the occasion of the war of the Spanish succession (see SUCCESSION WARS). Philip V. (q.v.) was the first of the Bourbon dynasty who occupied the throne of Spain. Under Charles III. (1759-88), a wise and enlightened prince, the second great revival of the country commenced; and trade and commerce began to show signs of returning activity. During the inglorious reign of Charles IV. (1788-1808), who left the management of affairs in the hands of the incapable Godoy (see ALCUDIA), a war (1796-1802) broke out with Britain, which was productive of nothing but disaster to the Spaniards, and by the pressure of the French another arose in 1804, and was attended with similar ill success. Charles abdicated in favor of his eldest son, the prince of Asturias, who ascended the throne as Ferdinand VII. Forced by Napoleon to resign all claims to the Spanish crown, Ferdinand became a prisoner of the French in the year of his accession, and in the same year Joseph, the brother of the French emperor, was declared king of Spain and the Indies, and set out for Madrid, to assume the kingdom thus assigned to him. But before this time, an armed resistance had been organized throughout the whole country. The various provinces elected juntas or councils, consisting of the most influential inhabitants of the respective neighborhoods, and it was the business of these juntas to administer the government, raise troops, appoint officers, etc. The supreme junta, that of Seville, declared war against Napoleon and France on June 6, 1808. In July, England, on solicitation, made peace with Spain, recognized Ferdinand VII. as king, and sent an army to aid the Spanish insurrection. Joseph, on July 9, entered Spain, defeated (through his lieutenant Bessières) the Spaniards at Rio Seco, and entered Madrid on the 20th; but the defeat of Dupont at Baylen by the veteran Spanish gen. Castaños, somewhat altered the position of affairs, and Joseph, after a residence of 10 days in his capital, was compelled to evacuate it, and retire n. to Vitoria. The noble defense of Palafox of the city of Zaragoza against Lefebvre, and the return of the marquis de la Romana with 7,000 regular troops who had been wiled from the country by Napoleon, did much to inspire the patriots. On July 12, 1808, sir Arthur Wellesley, afterward duke of Wellington (q.v.), at the head of the British auxiliary force, landed (Aug. 5) at Mondrago bay, and began the peninsular war by defeating the French at Roliza and Vimiera (q.v.); but in spite of his opposition the convention of Cintra was signed, and the French transported to their own country. In Nov., 1808, Napoleon, who had been preceded by Ney (q.v.) with 100,000 men, entered Spain, and at once assumed the command. For a time his armies were completely successful. Soult utterly routed the Spanish gen. Bel-

vedere, Nov. 10, and annihilated Blake at Reynosa on the 13th. Castaños and Palafox were routed at Tudela by Lannes, and in the beginning of December, Napoleon entered Madrid. At this time, the British forces were under the command of sir John Moore (q.v.), who, aware of his great inferiority in numbers and resources, retreated west from Salamanca, whither he had come to assume the command of the allied forces, and reached Coruña (q.v.) on Jan. 11, 1809. On April 22, Gen. Wellesley arrived in Portugal, and at once commencing operations, drove Soult from Oporto, and took possession of Portugal; then, favored by the disunity of action which subsisted between the three or four French armies who held Spain, he directed his attacks upon the army of the center, retreating when any of the others came to its aid, and by dint of masterly generalship and bold enterprise, succeeded, after four campaigns, in driving the French from the country. To this result, the co-operation of the Portuguese and of the Spanish *guerrillas*, the revengeful hatred of the peasantry toward their tyrannical oppressors, and the drafts from the Spanish armies so frequently made by Napoleon for his wars in central Europe, largely contributed. See WELLINGTON, SOULT, VICTOR, etc. Napoleon, loath to lose his hold of the peninsula, sent Soult, his most trusted gen., to stop the ingress of the British into France; but the battles of the Pyrenees (July 24—Aug. 1, 1813), and of the Nivelle, Orthez, and Toulouse, in the beginning of 1814, brought to a victorious conclusion this long and obstinate contest.

In 1812 a constitution, on the whole liberal, had been devised for the country by the cortes of Cadiz. It was abrogated, however, by Ferdinand VII. (q.v.), who treated the subjects who had shown such devoted loyalty to him with infamous ingratitude, and obtained the aid of France to establish despotism. The reign of his daughter, Isabella II. was disturbed by the Carlist rebellion, 1834–39, in which the British army under sir De Lacy Evans aided the queen. See CARLOS DE BOURBON. The next event of importance was the contest between Espartero (q.v.), the regent, and the queen-dowager Christina, for the supreme power during the minority of the queen. Espartero was successful from 1840 to 1843, but was compelled to flee before O'Donnell and Narvaez, and was not restored till 1847. The constituent cortes of 1837 drew up a new constitution, based on that of Cadiz. In 1845, another constitution was promulgated by Narvaez (q.v.), duke of Valencia. Frequent changes of ministry, occasional revolts, the banishment of queen Christina (1854), the formation of the O'Donnell ministry (1858), the war with the Moors (see MOROCCO), the annexation of St. Domingo in 1861, and the quarrels between Spain and her former colonies, Peru (1864–65) and Chili (1865), were the most marked events in the more recent history of Spain prior to 1868. In 1868 Isabella was driven from the throne by a general revolt; and the cortes, in Nov. 1870, elected prince Amadeo of Italy to be king. Finding the task of ruling constitutionally hopeless, Amadeo abdicated early in 1873, upon which the form of government was changed into a republic. During the remainder of 1873, and the whole of 1874, Spain was the scene of general anarchy and much bloodshed, resulting from the mutual opposition of the Carlists and republicans. On Dec. 31, 1874, Alphonso, son of the ex-queen Isabella, was declared king of Spain. He d. Nov. 25, 1885, and queen Christina became regent, acting in behalf of the infant king Alphonso XIII., born 1886. In 1895 a revolt broke out in Cuba. The previous revolt in 1881 had failed to secure independence, but had resulted in certain concessions and promises from Spain. Cuba became a Spanish province with the right of sending to the Cortes 30 representatives and 14 senators. In the opinion of a large part of the population these reforms did not better the condition of the island. There were complaints that the interests of Cuba were sacrificed for the benefit of the home government, that her offices were filled with Spaniards and her government corruptly administered. The seat of the revolt was, as in the earlier movement for independence, centered in the eastern and more sparsely populated provinces. The force of the insurgents soon reached a strength of 25,000. In the fall of 1895 a constituent assembly and a provincial government was established under Cisneros. Spain made strenuous efforts to put down the rebellion, and before the year ended had an army 117,000 strong in Cuba. The command was given to one of Spain's most eminent soldiers, Martinez Campos, who was authorized to promise administrative reforms. The policy of the insurgents, under their leaders, Gomez and Maceo, was to conduct a guerilla warfare, avoiding open fights and wearing out the enemy by delays. Spanish troops made little headway against the rebels and suffered heavily from the heat and from yellow fever. In 1896 Campos was recalled and General Weyler was sent to take his place. Much sympathy with the Cuban cause was manifested in the United States, and, in spite of that government's assurances of friendship toward Spain and neutrality toward the combatants, money and arms found their way from that country to Cuba. Great indignation was expressed in Spain against the people and government of the United States, the Queen Regent declaring that Spain would have stamped out the revolt in a short time if it had not been for the false hopes entertained by the insurgents of aid from a great power. For an account of the relations between the United States and Spain during the war, see the article UNITED STATES. The insurgent leader Maceo (q. v.) was killed in December, 1896.

In the spring of 1897, General Weyler announced that the western part of the island was completely pacified and the Queen Regent, on April 20, signed a decree instituting reforms in the government of Cuba. These included the establishment of an administrative council consisting of over 30 members, of whom the majority were to be elected by the Cubans, and the rest chosen by the Spanish government. The supreme control of affairs in the island was to be in the hands of this council. Later in 1897 it was evident that the western part of Cuba was not as completely subdued as General Weyler

had declared and the reinforcement of the already large Spanish army in the island was regarded as necessary. Weyler was recalled, and the command in Cuba assigned to General Blanco. In the fall of 1897 the Spanish premier, Canovas del Castillo, was assassinated by an anarchist. He was succeeded by Azcarragua, but the conservative government was unpopular on account of the Cuban matter and other difficulties, and the liberals were gaining ground. For an account of the revolt in the Philippine islands, see the article PHILIPPINE ISLANDS.

SPALATO (often erroneously called SPALATRO; in Illyric, SPLIT), an important seaport of Dalmatia, empire of Austria, is finely situated on a promontory on the eastern coast of the Adriatic. It originated in the famous palace of Diocletian, built in the 3d century. As this immense structure (which occupied 12 years in building) stood not far from the city of Salonæ, the great bulwark of Roman power in Dalmatia, it was called *Salonæ palatium*, briefly written *S. palatium*. When Salonæ was conquered by the Avars in the 7th c., the inhabitants fled for refuge to the fortress-palace of the emperor, where they laid the foundations of a new town, corruptly named *Aspalathum*, whence the modern *Spalato*. Even yet the greater part of the old town is compressed within the limits of the ancient palace, a considerable portion of whose walls still remain. The best-preserved parts of the palace are the supposed mausoleum of Diocletian, transformed in the 7th c. into a Christian cathedral, and the temple of Æsculapius, now a baptistery dedicated to St. John. Modern Spalato is divided into an old and a new town, the former consisting mainly of narrow, crooked, and dirty lanes; the latter more agreeable and open. It is the seat of a bishop, has a fine harbor, and carries on an active trade in grain, cattle, horses, oil, wine and liqueurs, and is the principal emporium for goods passing from Italy overland into Turkey. Pop. '90, 15,697.

SPALAX. See MOLE-RAT.

SPALDING, a co. in w. Georgia, bounded on the w. by Flint river; crossed by several railroads operated by the Central of Georgia railroad; 189 sq. m.; pop. '90, 13,117. The surface is undulating, the soil is fertile. The main productions are cotton, corn, wheat, cattle, and swine. Co. seat, Griffin.

SPALDING, HENRY H., 1810-68; b. Ky.; studied at St. Mary's and Bardstown; graduated at the Propaganda in 1837; was pastor of St. Joseph's Roman Catholic church at Bardstown in 1844; of the church in Louisville in 1849; and was vicar-general.

SPALDING, JOHN FRANKLIN, D.D., b. Maine, 1828; graduated at Bowdoin college in 1853, and at the general theological seminary, New York, in 1857; was minister of St. James's church, Protestant Episcopal, Oldtown, Me., 1857-59; rector of Grace church, Providence, R. I.; rector of St. Paul's church, Erie, Penn., 1862-74; elected missionary bishop of Colorado (1873); consecrated bishop in 1873. In 1874 he removed to Denver, Col. He published *The Threefold Ministry* (1864); *Manual of Prayers* (1872), etc. He has done much to advance the educational work of the church in Colorado.

SPALDING, JOHN LANCASTER, D.D., b. Lebanon, Ky., 1840; was educated at Mt. St. Mary's coll., and at the univ. of Louvain, Belgium; was ordained a Rom. Catholic priest; and was appointed sec. and chancellor of the diocese of Louisville, and later bp. of Peoria. He edited the Young Catholic series of school-books, and wrote *Life of Most Rev. M. J. Spalding, Archbishop of Baltimore*, and a number of essays and reviews.

SPALDING, MARTIN JOHN, D.D., 1810-72; b. Ky.; educated at St. Joseph's, Ky., and Rome in 1834; became Roman Catholic bishop of Louisville in 1849; succeeded Dr. Kenrick as archbishop of Baltimore in 1864. He has published *Miscellanies*; *Early Catholic Missions of Kentucky*; *Lectures on the General Evidences of Christianity*; *History of the Protestant Reformation* (2 vols). He edited with an introduction and notes the Abbé Darras's *History of the Catholic Church*, 4 vols. He convened the second national council at Baltimore; was an active member of the Vatican council, 1870-71, and favored the doctrine of papal infallibility.

SPALLANZANI, LAZARO, a celebrated anatomist and naturalist, was b. at Scandiano, in Modena, Italy, Jan. 12, 1729. After a careful education, he took clerical orders; and in 1764 he was appointed to the chair of logic, metaphysics, and Greek at Reggio; but soon after this he obtained a chair at Modena, and, refusing the tempting offers made him by the universities of Parma and Coimbra, and the academy of St. Petersburg, gave himself up to the study of natural history. His attention was directed to the doctrine of generation propounded by Needham and Buffon, which, after careful study and experiment, he overturned. He then turned his attention to the circulation of the blood, and was the first to follow its course through the intestinal tube, the liver, spleen, ventricles, pulmonary organs, etc.; "established," according to Senebier, "the propulsive power of the heart over the blood in the various vessels, demonstrated that the heart never wholly empties itself, explained the various causes which retard the circulation, and the obstacles produced by the weight of the blood." On the re-establishment of the university of Pavia, Spallanzani was appointed (1768) professor of natural history, and keeper of the museum, which he greatly enriched with fishes, crustacea, and testacea, the fruits of his numerous excursions. In 1785, refusing the chair of natural history at Padua, which had been so admirably filled by Vallisnieri, he accepted the proposal of the archduke Ferdinand to accompany, with doubled salary, the Austrian ambassador to Constantinople (Aug. 22, 1785); and during a residence of 11 months in Turkey found ample materials for study and observation. In 1788 he visited Naples whilst

Vesuvius was in eruption, the Lipari isles, and Sicily, in restless prosecution of his scientific labors, and then retired to Pavia, where, refusing the tempting offers of the French directory, he spent the remainder of his life, prosecuting his scientific researches amid bodily sufferings, and died of apoplexy, Feb. 12, 1799. His works, many of the more valuable of which have been translated into English, are too numerous to mention; but a complete catalogue of them, along with a biography, will be found in the *Bio-graphie Médicale*, vol. vii. See also, for the result of his labors, the *Eloge*, by M. Alibert, in the *Mémoires de la Société Médicale d'Emulation*.

SPAN, a natural measure of length, being the distance between the tips of the thumb and middle finger, the hand being stretched as much as possible. This space averages about 9 in., and the term came to denote a measure of 9 inches.

SPANCELED, in heraldry, a term applied to a horse two of whose legs are fettered by a log of wood.

SPANDAU, a t. of Prussia, in the province of Brandenburg, is situated at the confluence of the Havel and Spree; 9 m. w.n.w. of Berlin. Through extensive improvements in its fortifications and the construction of numerous detached forts, Spandau has been made a stronghold of the first rank for the protection of Berlin, has a citadel surrounded by water, with a garrison of upwards of 3000 men, and is a military depot. Spandau carries on manufactures of arms, gunpowder, woollens, etc., and has an active transit-trade as a station on the Berlin and Hamburg railway. Pop. '95 (with garrison), 55,841. It is one of the oldest towns in the middle mark of Brandenburg, and was long the residence of the kurfirsts of the Hohenzollern house.

SPANG'ENBERG, AUGUST GOTTLIEB, PH.D., 1704-92; b. Prussia; graduated at Jena, 1726, and lectured there; appointed adjunct professor and assistant superintendent of the orphan house, Halle, 1731; assistant to count Zinzendorf, 1734; founded the first Moravian settlement in America, at Savannah, Ga., 1735-39; returned to Europe and secured the settlement of Bethlehem, Penn.; organized the first Moravian society in England, at London, 1741; consecrated bishop, 1744, and went to America where for 18 years he superintended the whole Moravian work, making frequent journeys to the Indians, and being adopted into the Oneida nation; was a member of the college of bishops and elders to govern the whole Moravian church, 1762-90; 1764 was appointed supreme inspector in upper Alsace; and, in 1789, president of the general directory. His principal works are, *Life of Zinzendorf*, and an exposition of Christian doctrine which is the standard among the Moravians.

SPANHEIM, EZECHIEL, 1629-1710; b. Switzerland; educated at the Geneva university, where in 1651 he was appointed professor of elocution. He was tutor to the son of the elector palatine Charles Louis, and was employed by him in political missions, and also by the elector of Brandenburg, by whom he was made a baron. After the peace of Ryswick he was sent to France and England. He wrote a number of commentaries on and translations of classical authors as well as some numismatic treatises.

SPANIEL, a kind of dog of which there are many breeds, differing considerably in size and other characters. None of the spaniels are large; some are amongst the smallest of dogs. Some are used for sporting purposes, others are merely kept as pets and companions. All of them are lively, playful, docile, and affectionate in a high degree. The spaniel is ever petitioning for regard, and shows boundless joy on receiving marks of kind attention. The **ENGLISH** or **SUSSEX SPANIEL** is of an elegant but moderately stout form; with very large pendant ears, of which the hair is very long; the muzzle rather broad; the tail bushy; the body covered with long silky hair; the colors various, very often liver-colored and white, or red and white. The name spaniel is said to indicate the introduction of this kind of dog into England from Spain. In the days of falconry spaniels were much used for starting the game. The **COCKER** (q.v.), the **SPRINGER** (q.v.), and the **BLenheim dog** (q.v.) are different kinds of spaniels. The **KING CHARLES'S SPANIEL** is a beautiful black and tan breed, almost as small as the **BLenheim dog**, and derives its name from Charles II., who took great delight in dogs of this kind. The **WATER SPANIEL** is one of the larger breeds. It has comparatively hard hair, and is distinguished by its readiness to pursue game by swimming. It is much used in decoy ponds to drive ducks into the net.

SPANISH FLY. See **CANTHARIS**.

SPANISH GRASS. See **PAPER**.

SPANISH LANGUAGE AND LITERATURE. The Spanish language is one of the Romanic tongues, and, like the others, originated in the *lingua Romana rustica*. See **ROMANIC LANGUAGES**. The earliest of the different Spanish dialects that assumed a literary form was the Castilian, which gradually became, and has continued to be, the classic dialect of the nation. It finally blends a certain soft, lingering richness of cadence with an occasional sonorous majesty of expression, and on the whole may be considered one of the most beautiful of the European tongues. The course of Spanish conquest has also led to its establishment in Mexico, Central America, Cuba, Porto Rico, the greater part of South America, the Canary isles, and the Philippines. See the *Grammar and Dictionary* published by the Spanish Academy (1771); the grammars of Keil (Leip. 1837); Fuchs (Berl. 1837); Wiggers, and Schele de Vere (New York, 1854). The best material for a historical grammar is furnished by Diez in his *Grammatik der Romanischen Sprachen*. The best Spanish dictionaries, besides that of the Academy, are Cabrera's

(Mad. 1837); the Spanish-German by Seckendorff (3 vols. Hamb. 1823), and the Spanish-English of Neumann and Barette (re-edited by Velazquez, New York, 1852).

Literature.—The literature of Spain may, in a superficial sense, be regarded as commencing under the auspices of the Romans, for Lucan, Seneca, and other eminent Latin authors, were at least Spanish by birth; and, if we please, we may further look upon the Christian ecclesiastical writers of the Gothic period as the second link in the historical chain. But in the proper sense of the term, the literature of these two periods is no more Spanish—i.e., a national—than an English book by an Anglo-Indian is to be held as a portion of Hindu literature, or the sermons preached by a missionary to South Sea islanders are to be quoted as specimens of the literature of the Pacific. Passing over, then, the various developments of non-national literature in Spain—pagan Latin, ecclesiastical Latin, Arabic and Jewish—we come down to the 12th c., and then, for the first time after the gradual formation of a Spanish language, begin to notice the growth of something like a Spanish literature. Epic and didactic poems appear, written in Castilian verse, and full of strong national sentiment. The oldest of these is the *Poema del Cid* (see *CID CAMPEADOR*), of which only a single MS. exists. This MS. contains three other poems: *The Book of Apollonius, Prince of Tyre*; *The Life of our Lady, St. Mary of Egypt*; and *The Adoration of the Three Holy Kings*, the authorship of which (as of the *Poema del Cid*) is unknown. Other productions of this first period are the rhymed *Lives of the Saints*, by Gonzalo of Berceo (died about 1260); and the anonymous poem, *Count Fernan Gonzalez*, which, like the *Poema del Cid*, paints the earnest and picturesque struggle between the Moors and Spaniards. In all of these we trace the influence either of the church or of the chivalric poetry of France; but they maintain, nevertheless, a distinctively national and independent character. A great impulse was given to the artistic development of Spanish literature by Alfonso the wise of Castile (q.v.), who substituted Spanish for Latin in the courts of law, and fostered in many ways the growth of the national language. He is regarded as the founder of Spanish prose, his chief work in this department being the compilation of a series of codes, of which the most memorable is *Las Siete Partidas*, and a translation of the Bible into Spanish. Subsequent princes walked in his steps, and achieved an honorable reputation both as authors and patrons of literature, conspicuous among whom was the Infante Don Juan Manuel (died 1347), whose *El Conde Lucanor* (count Lucanor) is a collection of 49 tales, apologies, etc., from oriental sources, and wearing an oriental aspect. The most remarkable Spanish poet of the 14th c. is Juan Ruiz, arch-priest of Hita (died 1351). His pieces, composed in a great variety of measures, number some 7,000 verses, and include religious and love songs, fables, pastorals, etc. The didactic tendency is particularly visible in the *Danza General de la Muerte* (dance of death).

The second period of Spanish literature embraces the later portion of the middle ages, and is marked by the presence of lyric poetry in considerable quantity, alongside of the didactic. It seems to have been inspired by the strains of the provençal poets settled at the court of the counts of Barcelona, and always continued to be more courtly than national. The most complete collection of this lyric poetry is the *Concionero general* of Fernand del Castillo (Valencia, 1511; 10th edit., 1573), which contains the names of 136 authors, among which may be mentioned those of the marquis of Villena, and the marquis of Santillana, the three Manriques, Macias, Sanchez de Badajoz, Alonzo de Cartagena, Diego de San Pedro, and Fernan Perez de Guzman. Against this court-poetry, however, a strong reaction took place, the national spirit re-asserting itself vigorously in ballads, chronicles, romances of chivalry, and the drama. The best collection of the ballads (about 1000 in all) is to be found in the *Romancero general* (13 vols., 1605-14); of the chronicles (half-genuine, half-fabulous narratives of ancient Spanish heroes), the best are those of Ayala, of Juan Nuñez de Villaizán, the *Chronicle of the Cid*, and the *Chronicle of the Travels of Ruy Gonzalez de Clavijo*; of the romances of chivalry, the most celebrated is the *Amadis de Gaul*, parent of innumerable others (see *AMADIS*); and of the drama, among the first specimens are the pastoral plays of Juan de la Enzina, and the *Celestina* of Fernando de Rojas.

The third period, extending from the 16th to the 18th c., is the most splendid and productive in the annals of Spanish literature. Under Charles V., Spain became the foremost state in Europe, and the conquest of Naples brought it into close relation with the literature of Italy. The great Italian masters, such as Dante and Petrarch, began to be studied, and Italian measures and poetic forms to be imitated, although the rich, strong, Spanish spirit is never lost. The first of this new school was Juan Boscan Almogaver (died 1543), a brilliant sonneteer: other members of the same school are Garcilaso (q.v.) de la Vega, Diego Hurtado de Mendoza (q.v.), Francisco de Saa de Miranda, and Jorge de Montemayor (author of the once famous pastoral novel of *Diana* (see *NOVELS*), Fernando de Herrera (q.v.), and Luiz de Leon (died 1591), the last two of whom rank as the two greatest lyric poets that Spain ever produced. Gradually, a national drama established itself too. Conspicuous names in this department are Villalobos, Perez de Oliva, and Naharro (about 1517), sometimes regarded as the father of the Spanish drama. The last-mentioned wrote his comedies in the favorite national measure, the *redondillas*, and divided them into three acts. Besides these, we must mention Lope de Rueda, Juan de la Cueva, and Geronimo Bermudez, who cultivated tragedy with success. Among the most eminent prose writers of the first section of

this third period was Geronimo Zurita, author of *Annales de la Corona de Aragon* (Annals of the Crown of Aragon, 6 vols.)—a somewhat critical work, showing a decided advance on the credulous chronicles of the monks; Oliva, whose *Dialogo de la Dignidad del Hombre* (Dialogue on the Dignity of Man) is a fine specimen of elegant literature; and Morales, author of *Discursos* (Essays), relating to practical philosophy; etc.—Cervantes (q.v.) marks, if not exactly a new era, at least a splendid outburst of Spanish genius. It is unnecessary here to criticise the productions of his genius; we may only note, as it were, historically the fact, that his immortal *Don Quixote* put an end to the romances of chivalry—or rather to the extravagant imitations of these that sprung up after the age of chivalry had passed away. Lope de Vega (q.v.), a contemporary of Cervantes, and Calderon (q.v.), gave the national drama a European renown, and had, especially the latter, a host of followers more or less celebrated, among whom are Francisco de Rojas, Agustin Moreto, Fragosa, Diamante, Antonio Hurtado de Mendoza, Juan de la Hoz, Antonio de Solis, and Agustin de Salazar y Torres. The lyric and “epic” poets of this period, which embraces the second half of the 16th, and the whole of the 17th c., are innumerable, but not great. The most notable names are those of the brothers Argensola, and Alonso de Ercilla y Zuñiga (author of *Araucana*, a fine poem on the conquest of Araucania in Chili by the Spaniards). A peculiar form of the novel also appeared, called the “rogues’ novel,” of which the only memorable specimen is the *Guzman de Alfarache* of Mateo Aleman; and even it derives not a little of its importance from the fact that it suggested Le Sage’s *Gil Blas*. In history, the most distinguished names are those of Mariana (q.v.) and Solis.

The fourth period of Spanish literature extends from the accession of the Bourbons (1701) to the present time, and was long marked (like the contemporary literature of Germany) by a servile imitation of French models, and these by no means the best of their kind. This literary ascendancy of France in the first half of the 18th c. over all civilized Europe is a very curious phenomenon, worthy of closer study than it has yet received. The most notable of the Frenchified Spaniards was Ignacio de Luzan, whose *Poetica* (1737) is a thoroughly Gallician performance. His efforts to denationalize the literature of Spain were combated by Garcia de la Huerta and others, and at length a sort of compromise was effected, and the “Salamanca school” emerged into notice. Its founder, Malendez Valdez (b. 1754), was a man of high genius who subordinated his liberal culture to the sovereign control of a patriotic inspiration, and the same qualities are visible in its other members—Iglesias, Noroña, Quintana (q.v.), Cienfuegos, Arriaza, and Gallego. The great peninsular war, and the subsequent political movements in Spain, had a powerful effect in stirring up anew the elements of nationality, and the present century can show a lengthened list of names both in prose and poetry. We can only afford space for a few: Tapia, Maury, Juan Bautista Alonso, Jacinto de Salas y Quiroga, Espronceda, Serafin Calderon, Zorrilla, Hartzenbusch, R. de Campoamer, Santos Lopez Pelegrin, Villergos, and G. Gomez de Avellaneda, in poetry; Saavedra, Mora, Zorrilla Gregorio Romero y Larrañaga, Manuel de Santa Ana, Alarcon, in fiction; Leandro, Fernandez Moratin, in the drama; Ulloa, Muñoz, Capmany, Ferreras, Quintana, Navarrete, Clemencin, Torreno, and Maldonado, in history; Jovellanos, Arguelles, Castelar, Marina, Donoso Cortes, Martinez de la Rosa, etc., in political oratory.

Spain has not as yet achieved great results in any departments of science, either physical, mental, or moral; but of late years she has turned her attention seriously to scientific studies, and several admirable treatises in jurisprudence, political economy, medicine, philosophy, philology, and geography have been produced.—See Bouterwek’s and Sismondi’s *Histories of Spanish Literature*; and above all, Ticknor’s work on the same subject (3 vols., New York; 1849–54), which has been translated into Spanish.

SPANISH MACKEREL (see MACKEREL). The name Spanish mackerel is applied to different kinds of fishes; in the United States more particularly to the *cybium maculatum*, a slender, compressed, fusiform fish, having many rays in the dorsal and anal fins. Color bluish green above, a beautiful satin white below, with yellowish spots on the back and sides. As found in the market they vary much in size, weighing usually from one and a half to four pounds, although they are sometimes caught weighing seven or eight pounds. They are natives of tropical seas, but they range along the Atlantic coast from Brazil to cape Cod. A noted locality for them is the Chesapeake bay, where they are much larger generally than those which go farther north. They are among the very finest of fish for the table, and are peculiarly adapted to broiling, being juicier than almost any other fine fish, much more so than other kinds of mackerel. Along the coast of Cornwall, England, the name of Spanish mackerel is applied to the *scomber colias*, which much resembles the common mackerel, *scomber scombrus*, having much fewer rays in the dorsal and anal fins than the Spanish mackerel of the western Atlantic coast, and being also much smaller. See MACKEREL. The common mackerel is an important article of commerce. They are split and salted in small barrels and small tubs called kits, and assorted and numbered according to their quality, No. 1, No. 2, and No. 3, No. 1 being the largest and finest.

SPANISH MAIN (i.e., *main-land*), a name generally given during the 16th c. and the earlier part of the 18th to the n.e. coast of South America, from the Orinoco to the isthmus of Darien, as also to the contiguous southern portion of the Caribbean sea,

traversed by the Spanish treasure-ships. The name occurs very frequently in connection with the history and exploits of buccaneers (q. v.).

SPANISH POLITICAL PARTIES. See **POLITICAL PARTIES, SPANISH.**

SPANISH TOWN, until 1871 capital of the British possession of Jamaica (q. v.), on the right bank of the Cobre, and 10 m. w. of Kingston. It contains several important public institutions, is ill built and unhealthy and contains, '91, 5019 inhabitants.

SPANISH WINES. Of all the vegetable productions of Spain the vine is the most important, the lands being almost everywhere favorable to its culture. The excess of the vintage above the quantity consumed in the country forms a considerable branch of the export trade. In 1889 Spain exported to France, the chief consumer alone, 160,616,000 gallons. The wines grown in almost all parts of the country have much taste and bouquet, and great strength and durability, if subjected to proper treatment. In the preparation of white dry fortified wines, such as sherries, and in the confection of some sweet wines, such as Malagas, the Spaniards excel all other nations. Andalusia, an extensive region in the s., contains the belt of vineyards producing the *vino secco* and the *abocado*; there also is Rota, famous for its red wine. From this province come the wines of Moguro, or Moguer, Negio, Rancio, and Seville. Catalonia yields annually 20,000 butts of wine, mostly red. The Catalan was formerly shipped largely to South America, and much of it is at present exported to England and sold as Spanish port. Valencia produces annually 100,000 butts of wine, from which by distillation 20,000 butts of spirits are manufactured. The best qualities are grown on the hill-sides; the greatest quantities in the plains. Aragon produces dark-colored strong-bodied wines of good taste and flavor from the celebrated vines, the Grenache of Sabayes and the Carineña, and delivers them up to the trade of Saragossa. Granada, with its famed Malaga, produces wines and raisins. In the mountains of Malaga the vine attains almost tropical luxuriance, and bears three harvests every year. Galicia produces some good wine for exportation, such as Ribaclavia and Tuy, but the climate of Navarra is not favorable to viticulture, and the produce of Roncesvalles is insufficient to supply local demand. Biscaya, the most northern province of Spain, produces much wine. New Castile, with its renowned La Mancha, produces very agreeable wines, such as the muscat of Juncaral, near Madrid. Near these are the wines of Spanish Tagus, from Arganda del Rey, above Madrid, to Talavera de la Reyna. Murcia produces thick rough wines, and the island of Majorca produces a malvoisie wine, which is exported by way of Palma. Minorca produces a red dark wine around Alcyor, and the "Albafiora," a light white wine of much bouquet. The Spanish governments have frequently encouraged the production of wine.

SPANKER, a large quadrilateral sail, with parallel sides, set between the gaff and boom of a ship. Its fore-leech is attached by rings to the mast. The spanker is a fore-and-aft sail of great importance in bringing the vessel to the wind.

SPAR (Ger. *Spath*), a term used by miners to denote any bright crystalline mineral, and which has been adopted by mineralogists in the names of a number of minerals, as calcareous spar, fluor spar, etc., in which, however, it has no proper generic significance.

SPARIDÆ, a family of acanthopterous fishes, having a general resemblance to the perch family—a single dorsal fin, which is not protected by any scales, and of which the anterior rays are spinous, the pectoral and ventral fins sharp-pointed, the tail-fin notched; the gill-cover shining, without proper spines or denticulations; the palate destitute of teeth; the scales large, broader than long, and generally thin. There are several sections of the family distinguished by the teeth, which in some are all small and card-like, while others have trenchant, conical, and round molar teeth, variously arranged. The greater number inhabit the seas of the warm parts of the world; many species are found in the Mediterranean; a few on the coasts of Britain. Among the British species are the gilthead (q. v.), and several species of different genera, known by the common name of sea bream (q. v.). The sparidæ are generally good for food, and some are highly esteemed. Among them are *sargus* of the Mediterranean (*sargus Rondeletii*), much valued by the ancient Romans, and the sheep's head (*sargus ovis*) of the North American seas, which commands a very high price in the New York market.

SPARKS, JARED, American historian, was b. at Willington, Conn., May 10, 1789; graduated at Harvard university in 1815; became tutor in mathematics and natural philosophy, and one of the conductors of the *North American Review*. In 1819 he was settled as a Unitarian minister at Baltimore, when he wrote *Letters on the Ministry, Ritual, and Doctrines of the Protestant Episcopal Church*. In 1821 he established a periodical called the *Unitarian Miscellany and Church Monitor*, in which he first published his *Letters on the Comparative Moral Tendencies of the Trinitarian and Unitarian Doctrines*. In 1823 he edited six volumes of essays and tracts on theological subjects, and, abandoning the pulpit, became for seven years sole editor of the *North American Review*. In 1828 he published a *Life of John Ledyard, the American Traveller*; and from 1834 to 1837 edited at Boston 12 octavo volumes of the *Writings of George Washington*. This important national work was followed by the *Diplomatic Correspondence of the American Revolution* (12 vols. 8vo, Bost. 1829-30), and the *Life of Gouverneur Morris* (3 vols.

8vo, Bost. 1832). At this period he commenced the *American Almanac of Useful Knowledge*, and began also his *Library of American Biography*, first issued in two series of 10 and 18 vols. 18mo. In 1840 was published his collection of the *Works of Benjamin Franklin* (10 vols. 8vo), after which he visited Europe to collect materials for his *Correspondence of the American Revolution* (4 vols. 8vo, 1854). He also wrote, in 1852, two pamphlets in answer to Lord Mahon, on the *Life of Washington*. Besides these multifarious literary labors, combining laborious research with clear arrangement, a simple style and accurate statement, he filled, from 1839 to 1849, the McLean chair of history, and from 1849 to his departure for Europe in 1853, that of president of Harvard university. Sparks died Mar. 14, 1866.

SPARROW, *Passer* or *Pyrgita*, a genus of birds of the family *fringillidae*, having a strong conical bill, the upper mandible slightly curved, the lower mandible compressed and shorter than the upper, the nostrils partly concealed by the short feathers at the base of the bill, the legs moderately long and stout, the claws sharp and curved, the tail moderately long, and nearly even at the tip. The species are not very numerous, and are exclusively found in the old world. The **COMMON SPARROW**, or **HOUSE SPARROW** (*P. domesticus*), plentiful everywhere in the British islands, and too well known to need description, is found also throughout Europe, abounding particularly in the northern countries, from which its range extends eastward into Siberia, and southward to the n. of Africa and of India. Of all British birds the sparrow is the boldest in its approaches to man. Town sparrows are not mere visitors from the neighboring country, but constant inhabitants of the town itself, with the smoke of which their plumage is begrimed. The sparrow in its best plumage is not a very beautiful bird, nor has it such elegance of form as many others of the finch tribe; it has no melodious song, but its habits are interesting, and its frequent lively chirp pleasing. Sparrows often congregate in great flocks, particularly in autumn, when they find rich supplies of food in the ripened grain. The sparrow is one of the most omnivorous of birds. Animal and vegetable food seem equally acceptable to it. During summer vast numbers of insects and their larvæ are devoured by sparrows, and in this way they make amends for their plunder of the grain in autumn, which they begin as soon as it is sufficiently ripened, and continue as long as there are sheaves in the field. Their depredations have induced many farmers to use means for their destruction. They are good to eat, though little used for this purpose in Britain. It is otherwise in France, where all the small birds are sought after as articles of food. But the destruction of sparrows may be carried too far; and in France it has been followed by an increase of caterpillars, vastly more injurious to crops than the sparrows themselves. The sparrow makes a very inartificial nest, collecting a quantity of hay, or some similar material, in a hole of a wall, and lining it with feathers; sometimes, but more rarely, building a rude dome-shaped nest in the higher branches of a tree. Apart from the habitations of man, which it so much frequents, it often builds in crevices of rocks, or in cliffs on the sea-coast, or under the shelter of the nests of rooks, one rook's nest sometimes covering several nests of sparrows. Several broods are produced in succession, and the breeding season is prolonged over the whole summer, one brood succeeding another. The summer plumage of the sparrow is more brilliant than that of winter, and the female is of more sober plumage than the male, exhibiting indeed almost no variety of color.—The **TREE SPARROW** (*P. montanus*), the only other British species, is very similar to the common sparrow, but of rather smaller size. It is also a widely distributed bird, frequent over great part of the old world. It is rarely seen in towns.—In Italy the common sparrow is rare to the s. of Piedmont; and another closely allied species (*P. cisalpina*), takes its place, very similar in its habits as well as in its characters.—In America there are numerous species of *fringillidae*, popularly known as sparrows, of which the **WHITE-THROATED SPARROW** (*zonotrichia albicollis*) is most nearly allied to the true sparrows. The nostrils are in a small groove, and the tail is slightly forked.—The hedge sparrow (q.v.) is a bird very different from the true sparrows.—The name sparrow is popularly given in different parts of the world to many different birds, chiefly *fringillidae*.—The bird called sparrow in the English translation of the Bible is a species of thrush.

SPARROW-HAWK, *Accipiter* or *Nisus*, a genus of *falconidae*, ranked among the ignoble birds of prey (see *FALCONIDÆ* and *FALCONRY*). The bill is curved from the base, short, and compressed; its upper ridge rounded and narrow; the cutting margin of the upper mandible with a distinct festoon. The wings are short; the legs long, slender, and smooth. Only one species is British—the **COMMON SPARROW-HAWK** (*A. nisus*, *A.* or *N. fringillarius*), a small hawk, only about 12 in. in length, a considerable portion of the length belonging to the tail. It is found in almost all parts of Britain, and in Asia as far s. as Bengal, and as far e. as Japan. It is not found in America. It very often makes its nest in the deserted nest of a crow. It is a bold, active bird, very destructive to poultry and pigeons. The sparrow-hawk has often been trained for the purposes of falconry, to take land-rails, partridges, and similar game. The sparrow-hawk of Australia (*A. torquatus*) is marked by a collar of numerous bars of white. Its habits are very similar to those of the European sparrow-hawk.—The American sparrow-hawk (*Falco sparverius*), common in most parts of the United States, is similar in size to the European sparrow-hawk, but is rather allied to the kestrel.

SPARTA, anciently **LACEDÆMON**, the capital of Laconia, and the most famous city of Peloponnesus, occupied partly a range of low hills on the right bank of the Eurotas, and partly the intervening plain. Its appearance, even in its palmiest days, was by no means equal to its renown, for though not destitute of handsome public buildings, the severe law ascribed to Lycurgus, that "the doors of every (private) house should be fashioned only with the saw, and the ceiling with the axe," exercised a cramping influence on the development of architecture and of the fine arts generally. The natural defenses of the place, or at least of the long valley of Lacedæmon in which Sparta stood, were so great that it continued unfortified down to the Macedonian period—nearly a century after its mighty struggle with Athens for the hegemony of Greece; and, indeed, it was not regularly fortified till the time of the tyrant Nabis (195 B.C.). Previous to the Dorian conquest the primitive Achæans of Sparta seem to have dwelt in four or five scattered hamlets.—These hamlets were welded into one city, so to speak, by the conquerors, and became known as town-districts. The acropolis of Sparta occupied a hill in the northern part of the city, and was adorned with a temple to Athena (the tutelary goddess of Sparta), plated with bronze, whence it was called the brazen house, and the goddess herself *Chalciecus* (the dweller in the brazen house). On the bronze plates were beautifully sculptured various Greek myths. At the eastern base of the acropolis stood the agora, or market-place, whence streets proceeded to the different quarters of the city. Here stood the public buildings of the magistrates. The agora contained many statues. The principal street in Sparta, called the *Aphetais*, ran s. from the agora to the southern wall, through the most level part of the city, and was lined with a long succession of monumental edifices, chiefly *heroa* and sanctuaries. Along the banks of the Eurotas stretched the *dromos* (race-course), in which were several *gymnasia*, with temples of the Dioscuri, of the Graces, etc., and numerous statues; and still further s. lay a broader level, *Platanistas*, so called from the plane trees that grew there. This was the scene of those mock contests in which the Spartan youth learned to face without fear the realities of war.

The history of Sparta is really the history of Laconia. When the four hamlets, the *Pre-Dorian* Sparta, originated, we have no knowledge; but it cannot be doubted that their inhabitants were Achæans. It is during the rule of the Achæan princes that the events of the famous, but unhistorical, expedition against Troy, forming the subject of Homer's *Iliad*, are described as taking place. Menelaus, husband of Helen, whose flight with Paris occasioned the Trojan war, was king at Sparta, and it was during the reign of his grandson, Tisamenus (according to the legend), that the Dorians (q.v.) invaded Peloponnesus. The *fact* of a Dorian invasion is universally admitted, but of the details, scanty even as they are, we may safely be skeptical. We cannot even be certain of the date of the event, or even of the century in which it occurred. All that is clear is that the native Achæan population were deprived of political privileges, and appear henceforth as *periæci* (q.v.) and Helots (q.v.)—the Dorian conquerors alone forming the historical Spartans. Toward the middle of the 8th c. B.C. the Dorians of Sparta had not only thoroughly established themselves in their new settlement, but had subjugated the whole of the fertile and beautiful vale of Lacedæmon, commonly known as Laconia, and had begun to cherish ambitious views of extending their supremacy over the other Dorian settlements in Peloponnesus, viz., those of Messenia and Argos. Hence originated the Messenian wars (see **MESSENIA**), which terminated (668 B.C.) in the complete overthrow of the Dorians of Messenia, who were reduced by the victorious Spartans to the condition of *periæci*. Similar struggles occurred both with the older Achæan inhabitants in the center of Peloponnesus and with the Dorians of Argos, etc., in which the Spartans were generally successful. The development of their warlike and ambitious character is usually ascribed to the institutions of Lycurgus (q.v.); and whatever we may think of that more than semi-mythical personage, the institutions that go under his name were well fitted to make the Spartans exactly what they figure in history—a race of stern, cruel, resolute, rude, and narrow-minded warriors, capable of a momentary self-sacrificing patriotism (as in the story of the 300 heroes who fell at Thermopylæ), but utterly destitute of the capacity for adopting or appreciating a permanently noble and wise policy. The outbreak of the Peloponnesian war (431 B.C.) brought the rivalry between Sparta and Athens to a head, and in the mighty struggle that ensued, victory declared on the side of the combatant least capable of maintaining the greatness of Greece. Sparta now attained the hegemony of Greece; but her insolent tyranny in the hour of her triumph excited the indignation of those whom she held in virtual subjugation, and the glorious retaliation of the Thebans under Epaminondas (q.v.) stripped her of all her splendid acquisitions, and reduced the Laconian state to its primitive boundaries. Later, the rise of the Macedonian power limited still more the Spartan territory, nor did it ever after attain its earlier dimensions. Finally, after a series of vicissitudes, Sparta passed into the hands of the Romans, became a portion of the Roman province of Achaia, and shared the fortunes of the great republic.

SPARTACUS, the leader in the great insurrection of Roman slaves in southern Italy which took place 73 B.C., and in all probability the first servile captain in point of genius of whom history preserves a record, was a native of Thrace, and originally followed the occupation of a shepherd, but afterward became a robber-chief. Having the mis-

fortune to be taken prisoner, he was placed in a training-school for gladiators kept by one Lentulus Batiatus, at Capua. A conspiracy to escape was formed among the gladiators (200 in all, and mostly Gauls and Thracians), the heads of which were Spartacus, and two Gauls, Crixus and Enomaus. The conspiracy was discovered; but 70, among whom were the leaders, forced their way through the streets of Capua with cleavers and other such rude weapons as they could seize, defeated a detachment of Roman soldiers sent to bring them back, and established themselves on Mt. Vesuvius, where they received considerable accessions to their number—chiefly runaway slaves. Three thousand Roman troops under C. Claudius Pulcher sought to blockade them here and starve them into surrender. Spartacus was now chosen as their leader, with Crixus and Enomaus for his lieutenants. Descending the hill at a place and in a way totally unexpected, he took his assailants in the rear, and inflicted on them a disgraceful defeat. His original design had been limited to securing his freedom, and making his way back to his own country, nor during the two years that the insurrection lasted did he ever forget this ultimate aim; but in order effectually to carry it out, he recognized the necessity of a far more serious and extensive warfare than had yet been waged, and proclaiming freedom to all slaves, he contrived to raise his trivial mutiny to the dignity of a servile war. Circumstances were favorable. A great portion of Italy, especially of central and southern Italy, had been turned into pasture-land (see *ROME*), and instead of villages of sturdy and independent farmers, who owned the land they tilled, gangs of discontented slaves watched the flocks and herds of great nobles, demoralized by a plethora of ill-gotten riches. It was to these slaves that Spartacus appealed, and his summons was not in vain. Thousands upon thousands rushed to his standard, and victory followed him wherever he went. The story of his triumphs reads like a romance. No knight of chivalry was ever more uniformly successful, for a time. After defeating Claudius Pulcher, he routed and slew Cossinius, legate of Publius Varinus; then he worsted Varinus himself in several engagements, capturing his lictors and the very horse on which he rode. All the southern part of the peninsula now fell into his hands: the country was devastated, the cities either pillaged or garrisoned. But Spartacus knew too well the enormous resources of Rome, and the extraordinary energy which she was capable of exhibiting in the hour of peril, to hope for final success, and he consequently sought to induce his victorious bands to march northward to the Alps, and disperse to their own homes, the Gauls to the west, and the Thracians to the east. But the slaves were too deeply intoxicated with their success to see the wisdom of his proposal, and Spartacus had to continue his career of mere fighting against his better judgment, and embarrassed by the jealousies that are so apt to spring up among undisciplined and servile hordes. What brilliant gallantry and skill he showed, is known to all readers of Roman history. After the defeat and death of his lieutenants who had separated from him (72 B.C.), he marched north through Picenum toward the Po, overthrew first one consular army under Cn. Cornelius Lentulus and then another under Gellius Poplicola, and at the head of 100,000 men, meditated a march on Rome. Since the days of Hannibal, there had never been such danger! Fortunately, servile indecision and unwisdom saved the city. Spartacus was forced by his followers to retreat south, and took up his winter-quarters at Thurii, where he held a great fair for the sale of the spoils of Roman cities. In 71 B.C., Crassus (q.v.) took the field against the terrible slave-leader, but for a while even he could do nothing. Near Mutina, the proconsul, C. Cassius Longinus, and the proprætor, Cn. Manlius, were defeated; in Picenum, Mummius, a legate of Crassus's, was utterly routed; at last, however, Crassus succeeded in forcing Spartacus into the narrow peninsula of Rhegium, whence he tried to get into Sicily, with the view of rekindling the servile war that had recently raged in that island, but failed in his attempt, through the treachery of those with whom he had opened negotiations. Crassus now built lines of circumvallation to hem him in, and force him to surrender; but one stormy winter-night, Spartacus broke out of the toils prepared for him, and resumed the offensive, although he had suffered heavily by loss and desertion, and his forces were still further diminished by the formation of an independent army of Gallic slaves, which had no sooner got a leader of its own, than it was annihilated. Near Petelia, he once more defeated his adversaries; but seeing clearly that with such wretched materials as he had he could not hold out much longer, he made a dash at Brundisium, hoping to seize the shipping in the harbors, and get safely across the Adriatic to his native shore, but was baffled by the presence of Lucullus (q.v.). Pompey, too, had returned from Spain. There was nothing left for Spartacus but to die as gallantly as he had lived. Drawing up his army in battle-array, and solemnly slaying his war-horse, he began his last fight in a spirit of heroic desperation, and after performing prodigies of valor, fell unrecognized among the heaps of his slain foes. After his death, the slave insurrection was at an end.

SPARTANBURG, a n.w. co. of South Carolina, bordering on North Carolina, crossed by several railroads; drained by Pacolet and Tiger rivers; 949 sq. m.; pop. '90, 55,385. Co. seat, Spartanburg.

SPARTANBURG, city and co. seat of Spartanburg co., S. C.; on the Charleston and West Carolina, the Glenn Springs, and the Southern railroads; 98 miles n. of Columbia. It is the seat of Wofford college (M. E., S.), and of Converse college for women (non-sect.), and has the Kennedy public library, Morgan monument, gas and electric lights, street railroads, national and state banks, about 12 churches, daily and weekly newspapers, gold and iron mines, limestone quarries, and cotton mills. Pop. '90, 5544.

SPASM (Gr. *spasma*) consists in an irregular and violent contraction of muscular parts—involuntary even when the voluntary muscles are concerned. There are two sorts of spasm. In one there is an unusually prolonged and strong muscular contraction, not rapidly alternating as usual with relaxation, the relaxation only taking place slowly and after some time. This is known as *tonic spasm* (Gr. *tônōs*, a bracing up) or *cramp* (q.v.) “When in a more moderate degree affecting the voluntary muscles generally, it constitutes catalepsy (q.v.), in which, from the muscles remaining contracted, the limbs will retain whatsoever attitude they are placed in until the spasm is over. But the extreme example is tetanus (q.v.), in which the spasms are so violent and so enduring that they may be said to squeeze the patient to death.”—Williams's *Principles of Medicine*, 2d ed. p. 72. In the other form of spasm, the contractions of the affected muscles take place repeatedly, forcibly, and in quick succession; the relaxations being, of course, equally sudden and frequent. This is named *clonic spasm* (Gr. *klônōs*, an agitation, and is popularly known as *convulsions*. Chorea (or *St. Vitus's dance*), epilepsy, and convulsive hysteria afford examples of this kind of spasm.

The treatment varies according to the cause of the excessive muscular irritability. Firm pressure on muscles affected with spasm will promote their relaxation, and by strong steady pressure on the masseter muscles, the lower jaw has been depressed, so as to open the mouth in cases of lock-jaw. The medicines which are employed to counteract irregular or inordinate muscular action are termed *antispasmodics*; but spasm may depend upon so many different causes, that the remedies which are found most successful in combating it must vary extremely in their nature. There are, however, a few medicines which appear to exercise a control over spasmodic action generally. These may be termed *pure or true antispasmodics*. They are asafetida, coryledon umbilicus (or common navel-wort), wood-soot, galbanum, musk, rue, sagapenum, sumbul (jatamansi or musk-root), and valerian. Among the narcotics often useful in these affections we may especially mention belladonna, cannabis indica (or Indian hemp), opium, and stramonium. Sulphuric ether in draught or inhaled, and inhaled chloroform, are often of service. In some cases remedies which directly depress the vital powers, such as the prolonged use of the warm bath, or even, in rare cases, the abstraction of blood, are the most effectual means of subduing spasm.

SPATHE (*spatha*), in botany, a sheathing bract which incloses one or more flowers, as in the *narcissus*. Very frequently the flowers within a spathe are arranged upon a *spadix*, which is a succulent spike, with numerous flowers, and of which a familiar example may be seen in *arum maculatum*. The spadix is a characteristic feature of the palms, and in them is compound or branching, and in general is not only provided with a common spathe, but with secondary spathes at its divisions. See *illus.*, GRAIN, ETC., vol. VI.

SPAULDING, LEVI, D.D., 1791-1873; b. New Hampshire; graduated at Dartmouth college 1815; at Andover theological seminary, 1818; sailed as a missionary of the American board for Ceylon 1819; reached Jaffna, 1820. He lived for a number of years in Manepy. In 1833 he, with Mrs. Spaulding, removed to Oodooville, and took charge of the Oodooville central school for girls. For about 40 years, with untiring patience, sympathy, and care, they watched over the little ones, sometimes to the number of 120 or 130; receiving them usually when about eight years of age, and seldom parting with them until they were married. Mr. Spaulding was fluent in the use of the language, and his originality and power of illustration gave him ready access to the native mind. He preached Christ by the roadside, in the field, in the school-room. His literary work was multitudinous; not only were school-books, hymn-books, tracts, gospels, continually passing through his hands for revision and proof-reading, but he wrote and translated some small but valuable books and some excellent hymns, besides preparing an English and Tamil dictionary. In addition to this he aided in the revision of a Tamil version of the Scriptures. He visited America once in the 53 years of his life among the heathen. The native converts throughout the district loved him as a father.

SPAVIN, a disease of horses, occurs under two different forms, both interfering with soundness. In young, weakly, overworked subjects, the hock-joint is sometimes distended with dark-colored thickened synovia or joint-oil. This is bog or blood spavin. Wet bandages, occasional friction, a laxative diet, and rest should for several weeks be diligently tried; and if such remedies prove unsuccessful, the swelling must be dressed with strong blistering ointment, or fired. The second variety of spavin is the more common and serious. Toward the inside of the hock, at the head of the shank-bone, or between some of the small bones of the hock, a bony enlargement may be seen and felt. This is bone spavin. At first there is tenderness, heat, swelling, and considerable lameness; but as the inflammation in the bone and its investing membrane abates, the lameness is less perceptible, although the animal continues to drag his leg and go stiffly. In recent and slight cases, cold water should be applied continuously; but in serious cases, when the limb is swollen and tender, hot fomentations are best. For several days they must be perseveringly employed. When the limb is again cool and free from pain, an iodide of mercury or fly-blister should be applied, and the animal treated to three months' rest in a small paddock, the end of a barn, or a roomy loose-box. In persistent cases, firing or setoning usually gives much relief.

SPEAKER, the name given to the presiding officer in either house of parliament. In the house of lords, the lord-chancellor, or lord keeper of the great seal, is *ex-officio* speaker, and one or more deputy-speakers are appointed by commission to take his place in his absence. Since 1851 it has been the practice to appoint but one deputy-speaker, who is the chairman of the lords' committee, and should he also be absent, the house can choose a speaker *pro tempore*. The speaker of the lords may speak or vote on any question, and has no more authority than any other member of the house.

In the house of commons, the speaker is a member elected to that office at the desire of the crown, and confirmed by the royal approbation given in the house of lords. A similar office seems to have existed as early as the reign of Henry III., when Peter de Montfort signed and sealed an answer of the parliament to Pope Alexander, *vice totius communitalis*; but the title speaker was first given to sir T. Hungerford in the reign of Edward III. The speaker of the house of commons presides over the deliberations of the house, and enforces the rules for preserving order: he puts the question and declares the determination of the house. As the representative of the house, he communicates its resolutions to others, and conveys its thanks or its censures. He is thus the mouth-piece of the house, whence his title seems to be derived. He issues warrants in execution of the orders of the house for the commitment of offenders, for the issue of writs, the attendance of witnesses, the bringing up prisoners in custody, etc. The mace is borne before him by the sergeant-at-arms when he enters or leaves the house; when he is in the chair it is left on the table, and it accompanies him on all state occasions. He cannot speak or vote on any question, but on an equality of voices he has a casting vote. Both by ancient custom and legislative declaration, he is entitled to take precedence of all commoners.

Down to the year 1853 no provision existed for supplying the place of the speaker of the house of commons when he was unavoidably absent; but in that year the house, with consent of the crown, resolved that in his absence the chairman of the committee of ways and means should take the chair, and as deputy-speaker he was in 1855 invested, both by resolution of the house and by act of parliament, with the same authority *pro tempore* as the speaker. The speaker of the U. S. house of representatives is a member of the house, chosen from among themselves for the office, and during the time of his holding it receives (since 1874) a salary of \$8000. He presides over the sessions of the house; makes the appointments of members of committees; signs all its bills, resolutions, and acts of authority; certifies to the mileage, etc., of members; and appoints three of the regents of the Smithsonian institution. He can be removed from his position by an act of the house. The position is one of great importance. See CONGRESS.

SPEAKING. See READING and SPEAKING.

SPEAKING-TRUMPET, an instrument for giving concentration rather than dispersion to the waves of sound originated by the articulation of the human voice, and thereby enabling the sound to be conveyed to a greater distance. It is of the utmost use on shipboard in enabling the officers to convey orders during windy weather from one part of the deck to another, or to the rigging. The invention is ascribed to sir Samuel Morland, in 1670, though Athanasius Kircher laid claim to it. Morland's trumpet was of the same form as that now in use, viz., a truncated cone, with an outward curve or lip at the opening.

The theory of the action of this instrument has never been thoroughly explained; but it is supposed that the sides of the tube throw the sound back and back in various reflections, until ultimately the waves quit the instrument in parallel lines. It does not seem to depend on vibration of the instrument.

SPEAR, a pointed weapon with a shaft of greater or less length for thrusting, throwing, or receiving an assault. See JAVELIN, LANCE, PIKE.

The *spear-foot* of a horse is his far foot behind.

SPEAR, SAMUEL P., 1815-75; b. Boston, Mass.; enlisted in the army, 1833; served in the Florida and Mexican wars under Gen. Scott; was wounded at Cerro Gordo. He was assigned to duty on the frontier, 1848-61, and engaged in the operations in Utah under Gen. A. S. Johnston. In the war of the secession he recruited and commanded the 11th Penn. cavalry, was wounded twice at Five Forks, promoted to brig.gen. and brevetted maj.gen. for gallant service. He died from disease contracted in the army.

SPEAR, SAMUEL THAYER, D.D., b. N. Y., 1812; graduated at the college of physicians and surgeons, New York, 1833; studied theology with Dr. Beman of Troy; was ordained and settled pastor of the Presbyterian church, Lansingburg, N. Y., 1835, and of the South Presbyterian church, Brooklyn, 1848; became one of the editors of the *Independent*, 1870. His publications are *The Family Power: Eighteen Sermons on the Rebellion*; *The Legal-Tender Acts considered in Relation to their Constitutionality and Political Economy*; *Religion and the State, or the Bible and the Public Schools*. He is an earnest advocate of the secularization of the government.

SPEARMINT. See MINT.

SPECIAL CASE is the name given in the law of England to a statement of facts submitted to a court for its opinion as to the proper application of the law, or proper legal

inference to be drawn from such facts. It is drawn up by mutual agreement of the parties, and may be agreed upon at any stage of the suit, or even before any step has been taken in it.

SPECIAL JURY is, in England, a jury consisting of a superior class of men, such as esquires or persons of higher degree, bankers, or merchants selected by the sheriff, and formed into a separate list. Either party to an action may demand a special jury, but he must pay the extra expense, provided the judge do not certify at the conclusion of the trial that it was a proper case to be tried by a special jury, in which case the costs are part of the costs in the cause. Each special jurymen gets a guinea for his attendance on the case. The advantage of a special jury is, that the jurors are less likely to be carried away with vulgar prejudices, and more intelligent, and able to understand difficult cases.

Special juries are not known in the U. S., as in ordinary matters it is presumed that all citizens are equally capable of deciding upon the facts. What are called struck juries, however, are generally recognized. Such juries are formed in a peculiar way. The sheriff makes a list of 48 men. From this list first one side and then the other strikes off a name until 24 names only are left, from which the jury of 12 is selected by lot. These juries are composed of men particularly adapted to try cases involving technical knowledge, as a jury of physicians to try a case involving much knowledge of physiology or anatomy.

SPECIAL LICENSE, in the marriage law of England, means a license obtained from the archbishop, which enables the priest to marry the parties without the publication of bans, and also at any time or place other than those necessary in ordinary cases. The statute of 25 Henry VIII. c. 21, entitled an act concerning Peter Pence and dispensations, continued to the archbishop of Canterbury the same right, as the pope previously had to grant special licenses to marry at any convenient time and place. By a regulation of archbishop Secker in 1759, the privilege is restricted to children of peers, and privy counsellors, judges, baronets, and knights. The same conditions apply to applicants as in other cases, except that the special license merely authorizes a different time and place for the marriage than in other cases. The stamp-duty is £5.

SPECIALTY DEBT, in English law, was a debt constituted by deed under seal, as a bond, which in the event of the debtor's death had a right of prior payment over simple contract (q.v.) debts. Such preference is, since 1870, abolished, except where a lien or other security is held for the debt.

SPECIE PAYMENTS, RESUMPTION OF. Shortly after the outbreak of the civil war, specie payments were suspended, not by legal enactment, but by the action of the banks throughout the country, the New York banks taking the initiative by suspending coin payment, 1861, Dec. 30. This was the natural result of the fact that a large proportion of the metallic currency had gone abroad to pay foreign indebtedness. The government was obliged to follow this example in regard to U. S. notes then outstanding and matured, and it consequently became necessary to meet the requirements of trade by increasing the volume of paper currency (see BANK-BANKING) and declaring such currency a legal tender for all debts public and private, except duties on imports and interest on the public debt. By 1864, Jan. 30, the amount of outstanding notes or greenbacks had increased to \$449,338,902, but in June of the same year an act was passed limiting the amount issued, or to be issued, to \$400,000,000, and such additional sum, not exceeding \$50,000,000, as might be temporarily required for the redemption of temporary loans. This act was rendered necessary by the alarming depreciation which had taken place in the value of greenbacks. A retirement of the balance in excess of the newly legalized amount was gradually made. In 1865, Sec. McCullough advocated a further contraction of the greenback currency with a view to as early a resumption of specie payments as the business interests of the country would permit. Congress, concurring in this view, directed, 1866, April 12, that ten millions of outstanding greenbacks might be retired and canceled within 6 months, and that thereafter, four millions or less might be retired per month. Under this act the outstanding amount was reduced to \$356,000,000 by the end of 1867. But the stringency of the money market began to cause alarm, no more retirements were made and, 1868, Feb. 4, congress suspended the authority to further reduce the paper-currency. The panic of 1873, which by many was attributed, in part at least, to the withdrawal of money from circulation, led to the reissue of some of the notes which had been retired. Secretaries Boutwell and Richardson both held the opinion that these notes could be reissued until the maximum limit of four hundred millions had been reached. But in 1874 congress reduced the limit to \$382,000,000, the amount then actually outstanding. In 1875, Jan. 14, the Resumption act was passed. This provided for the coinage of fractional silver currency to redeem notes of similar denominations, until all the fractional paper currency had been withdrawn from circulation; for an unlimited issue of national bank notes, with a concurrent retirement of legal tender notes to the extent of 80 per cent. of the issue of national bank notes until the outstanding amount had been reduced to \$300,000,000; and for the redemption in gold coin of such outstanding amount on and after 1879, Jan. 1, on the presentation of the notes in sums of \$50 and upward.

at the sub-treasury in New York. To carry this act into effect, the sec. of the treasury was authorized to use surplus revenues of the government, and also to issue at par in coin either of the descriptions of bonds authorized by the refunding act of 1870. Between the date of this act and the day fixed for resumption there was no important legislation affecting the money market, except the passage of the silver act, 1878, restoring to the currency of the country the old silver dollar of 412½ grains, and enforcing its coinage to the extent of at least two millions a month. Many strenuous efforts indeed were made to repeal the resumption act but without effect. As the appointed day approached Sec. Sherman bent all his energies to provide the coin reserve presumed to be necessary to meet the emergency, and his preparations were so complete that on 1879, Jan. 1, the treasury held about \$135,000,000 in coin available for resumption purposes, or 40 per cent. of the amount of notes to be redeemed. But the actual conversion of paper-money into coin was very small. The banks of the country held about one-third of the total amount of treasury notes, but their confidence in the power of the government to maintain resumption was so great that none were presented by them for redemption. The people in general preferred the issues of the banks and of the government to coin, on account of their superior convenience and portability, so that the resumption of specie payments neither decreased the volume of paper currency nor depleted the treasury of its coin. It merely placed the gold and the paper dollar on the same basis, prevented unnecessary fluctuations in the value of legal tender currency, and so established renewed confidence in business circles, and marked the end of the commercial depression consequent upon the revulsion and panic of 1873.

SPECIE. Gold, silver, copper, or nickel made into coin (q.v.) and used as a circulating medium of commerce; hard money. See **BANKING**.

SPECIES, in natural history, a term employed to designate groups inferior to genera (see **GENUS**), but superior to varieties (see **VARIETY**). In mineralogy, the term is of very arbitrary application, serving only, like class, order, genus, etc., the purpose of classification, although it thus indicates common characters or points of real agreement among minerals. In organic nature, it has usually been regarded as possessing a higher and more definite signification. But no term is more difficult to define. Many definitions have been proposed, but none wholly satisfactory; every attempt at definition involving more or less the adoption of some disputed theory. If, for example, a species is regarded as including all the beings which have descended from parents created with the essential characters now belonging to the species, not only is the original creation in that particular form taken for granted, but likewise the impossibility of changes in nature, which some of the most eminent naturalists regard as actually taking place, and the belief of which implies no doubt of the act of creation itself, but only a certain opinion as to some of the laws by which organic nature is governed. To regard species as mere indeterminate and fluctuating groups, capable of indefinite modification in the lapse of ages, is equally to adopt a theory. If a species is defined as containing all the individuals which are capable of intermingling without consequent sterility of progeny, other difficult questions must be decided before the definition can be adopted as to any classes of creatures, while to many kinds it seems incapable of application, and much that is merely theoretical is involved in it.

Naturalists have very generally regarded species as unchanging throughout the longest succession of generations, except within narrow and marked limits, and have substantially adopted the definition of Buffon: "A *species* is a constant succession of individuals similar to and capable of reproducing each other." Thus De Candolle, the eminent botanist, says: "We unite under the designation of a *species* all those individuals that mutually bear to each other so close a resemblance as to allow of our supposing that they may have proceeded originally from a single being or a single pair." And Cuvier, the great zoologist, describes a species as "a succession of individuals which reproduces and perpetuates itself." Here it may be remarked, that even if the permanence of species implied in these definitions were fully ascertained, and their original creation in their present form admitted as unquestionable, it would by no means follow that we must suppose every species to have proceeded from a single individual or a single pair. Nor, accepting the Biblical statement concerning the human race, that all mankind are the offspring of a single pair, are we entitled to infer that such has been the case also as to all animals and plants capable of freely intermingling, and which, therefore, are commonly regarded as forming one species.

But the separate creation and immutability of species are disputed, some naturalists maintaining that species undergo modification, and that existing forms of life have descended by true generation from pre-existing forms. Lamarck was the first to proclaim this doctrine, at least so as to attract much attention, about the beginning of the 19th century. He held that all species, even including man, are descended from species of inferior organization; while to account for the existence of very simple forms at the present day, he had recourse to the supposition of their spontaneous generation. He was followed, with greater caution, by Geoffroy Saint-Hilaire, who regarded what we call species as various degenerations of the same type, but did not believe that the existing species are now undergoing modification. Similar views have since been stated

by many authors. But the works which have most strongly directed attention to them, and in which they have been most fully advocated, are the *Vestiges of the Natural History of Creation*, by an anonymous author, originally published in 1844, and which has since passed through many editions; and Darwin's work *On the Origin of Species by means of Natural Selection*, originally published in 1859. Of the other supporters of these views, the most eminent is prof. Huxley, who, without fully adopting the views either of the author of the *Vestiges* or of Darwin, advocates "the hypothesis which supposes the species living at any time to be the result of the gradual modification of pre-existing species," and maintains that to suppose each species of plant and animal to have been formed and placed on the surface of the globe at long intervals by a distinct act of creative power, is an assumption "as unsupported by tradition or revelation as it is opposed to the general analogy of nature."

It is impossible for us to do more than very briefly exhibit the principal arguments which have been urged on this question. Lamarck rested much on the well-known effect of use or exercise in strengthening and enlarging an organ, and of disuse in atrophying it. "He conceived that, an animal being brought into new circumstances, and called upon to accommodate itself to these, the exertions which it consequently made to that effect caused the rise of new parts: on the contrary, when new circumstances left certain existing parts unused, these parts gradually ceased to exist. Something analogous was, he thought, produced in vegetables, by changes in their nutrition, in their absorption and transpiration, and in the quantity of caloric, light, air, and moisture which they received. This principle, with time, he deemed sufficient for the advance from the monad to the mammal." The author of the *Vestiges* from whom this account of Lamarck's views is taken, regards him as in error "in giving this adaptive principle too much to do;" and says: "In the present day, we have superior light from geology and physiology, and hence comes the suggestion of a process analogous to ordinary gestation for advancing organic life through its grades, in the course of a long but definite space of time, with only a recourse to external conditions as a means of producing the exterior characters." The author of the *Vestiges* designates the principle for which he contends that of *Progressive Development*, and states it as follows: "The proposition determined on, after much consideration, is, that the several series of animated beings, from the simplest and oldest up to the highest and most recent, are, under the providence of God, the results, *first*, of an impulse which has been imparted to the forms of life, advancing them in definite times, by generation, through grades of organization terminating in the highest dicotyledons and vertebrata, these grades being few in number, and generally marked by intervals of organic character which we find to be a practical difficulty in ascertaining affinities; *second*, of another impulse connected with the vital forces, tending, in the course of generations, to modify organic structures in accordance with external circumstances, as food, the nature of the habitat, and the meteoric agencies, these being the 'adaptations' of the natural theologian." He further regards the *nucleated vesicle* as "the fundamental form of all organization, the meeting point between the inorganic and the organic," and as "the starting point of the fetal progress of every higher individual in creation, both animal and vegetable." Founding on instances of the production of the *proximate principles* of which organic substances are composed in the laboratory of the chemist, he goes on to say that "an operation which would produce in these the nucleated vesicle is all that is wanting effectually to bridge over the space between the inorganic and the organic;" and that "it does not seem, after all, a very immoderate hypothesis, that a *chemico-electric operation, by which germinal vesicles were produced*, was the first phenomenon in organic creation, and that the second was an *advance of these through a succession of higher grades, and a variety of modifications* in accordance with laws of the same absolute nature as those by which the Almighty rules the physical department of nature." He regards the idea of species or specific distinction, therefore, "as *merely applicable to certain appearances presented, perhaps transiently, to our notice*." He adduces instances of great changes of form and character known to take place in the lower departments of nature, both animal and vegetable, as giving probability to the supposition, that in a long succession of generations, great changes may take place also in the higher.
